INDEX

ABDEL-MALEK, Dr A A , and Baldwin, Dr W F Specificity of Plant Feeding in Mosquitoes as determined by Radioactive Phosphorus, 178
Abdel-Malek, Dr A A , and Kevan, D K McE Inhibited Oviposition by Females of *Gryllus assimilis* (F), induced by Radioactive Males, using L-Methionine-Methyl-^{14}C, 681
Abel, J E , and others Kinetics of Reaction of the Decomposition of Lead Azide, 626
Abella, Dr I D , and Townes, Dr C H Mode Characteristics and Coherence in Optical Ruby Masers, 957
Abercrombie, Prof Michael Appointed to the Jodrell chair of zoology and embryology in University College, London, 1132
Aberrations (Chromatid) Production of, by Diepoxybutane and an Iron Chelator (Prof Norman S Cohn), 1093
Aberrations (Chromosomal), induced by an Animal Virus (Dr Berge Hampar and Dr Solon A Ellison), 145
Ability Creative, 1
Abnormal Globin Formation in Human Megaloblasts (Prof Austin S Weisberger and Ernest P Noble), 1261
Abnormal Haemoglobins Segregation-ratio Advantage of (L N Went), 382
Aborigines (Australian) Absence of Red Cell Enzyme Deficiency in (Prof O Budtz-Olsen and Dr Chev Kidson), 765
Abraham, R J , and others Structures and Conformations of some Naturally Occurring Derivatives of Proline, 1150
Abraham, S , and others Particle Involvement in Fatty Acid Synthesis in Liver and Yeast Systems, 1287
Abramovitch, Prof R A , and Ahmed, K S Oxidative Decarboxylation of Indole-3-acetic Acid by Mangani-Versene and by Wheat Leaf Enzyme, 259
Abreu, Luiz A , and Abreu, R Raposo Effect of Riboflavin on Liver Histomucoid, 261
Abreu, R Raposo, and Abreu, Luiz A Effect of Riboflavin on Liver Histomucoid, 261
Absence of Correlation between Odour and Molecular Vibration (K Buijs, C J H Schutte and F Verster), 751
Absence of Red Cell Enzyme Deficiency in Australian Aborigines (Prof O Budtz-Olsen and Dr Chev Kidson), 765
Absence (Controlled), of Extracellular Glucose Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the (P Volfin, D Eboué and H Clauser), 166
Absorption of Potassium by Vermiculite Influence of some Organic Salts on the (Prof M M Mortland), 481
Absorption (Increased Iron), without Increase in the Rate of Erythropoiesis (Dr Gerald A Mendel), 878
Absorption (Ultra-violet), of Sea Water (F A J Armstrong and G T Boalch), 858
Absorption Band The Optical F (Dr Harold A Papazian), 1286
Absorption Spectroscopy (Atomic) Application of, to the Determination of Calcium in Saliva (Ernest Newbrun), 1182
Absorption and Excretion of Penicillin injected into the Muscles of Patients with Diabetes Mellitus (Dr L Weinstein and Dr R H Meade), 987
Absolute Age of Pleistocene and Holocene Deposits in the Haua Fteah (Dr C B M McBurney), 685
Abstracting Services Inventory of (Féderation Internationale de Documentation), 1026
Academia Sinica, Peking Delegation from the, to visit Britain at the invitation of the Royal Society, 211
Acanthocephalan Parasite of the Eider Duck Life-Cycle of an (Dr C Rayski and E A Garden), 185
Accademia dei Lincei, Rome Premio Feltrinelli for biological sciences awarded to Prof J B S Haldane, 710
Acceleration of Speech Arrest of, evoked by Thalamic Stimulation in the Course of Stereotaxic Procedures for Parkinsonism (Dr G Guiot, and collaborators), 921
Acceleration (Kinetin-induced Meiotic-Prophase), and Stasis in *Tradescantia* Anthers cultured in Media Deficient in Sugar (Prof G W R Walker and J Dietrich), 889
Accelerator Conference Proceedings of the Second (Amsterdam, 1960), edited by Prof K Siegbahn, 123
Accelerators for Low-Energy Nuclear Physics, 1239
Accelerators (Particle) Amsterdam Conference on, 123
Accidents (Nuclear) A Warning System for (Prof F W Spiers), 31
Accumulation of Asparagine in Maize Plants infected by Maize Rough Dwarf Virus and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
Accumulation (Intracellular), of Amino-Acids in Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin on Glucose Uptake and (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Accumulation (Massive), of a Derivative of Cytidine Diphosphate in the Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*— (Dr J J Saukkonen), 816
Accumulation (Sodium) Anaerobiosis and (James E Leggett and Lewis H Stolzy), 991
Acetomonas Dihydroxyacetone Production in (Dr J G Carr and J L Shimwell), 683
Acetone (Liquid) Radiolysis of—Effect of Dose-rate and Linear Energy Transfer (R Barker), 62
Acetylase (Insect Choline), Condensing Enzyme and Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on (Jennifer Rothschild and Dr G F Howden), 283
Acetylating Enzyme System from Pigeon Liver Inactivation of *A*-Methopterin by the (V Krishnamurthy and Beatriz M Braganca), 68
Acetylcholine Release of Noradrenaline from the Spleen of the Cat by (K W Brandon and Helen Boyd), 880
  Stimulation of Uptake of Calcium-45 in the Adrenal Gland by (Prof W W Douglas and A M Poisner), 1299
Acetylcholine in Sweat in Fibrocystic Disease of the Pancreas (Dr Edward L Eyerman, Dr Robert J Hurley and Dr Richard L Irwin), 77
Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, Condensing Enzyme and (Jennifer Rothschild and Dr G F Howden), 283
Acheta domesticus L (House Cricket) Home and Distribution of the (Dr A S K Ghouri), 1000
Acid Extract of Leucocytes and *Staphylococcus pyogenes* (A G Towers), 272
Acid Soils Nature of Sulphate Retention by (Monica Liu and G W Thomas), 384
Acid Solution Sedimentation of β-Lactoglobulin (*A*,*B*) under Dissociating Conditions in (Lilo M Gilbert and Dr G A Gilbert), 1181
Acid and Penicillinase New Penicillins Stable towards both (F P Doyle, A A W Long, J H C Nayler and E R Stove), 1183
Acid–Schiff Technique (Periodic) Limitations of the, for the Demonstration of Stages of *Eimeria* in Tissues (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Acid–Schiff Technique (Periodic), for the Demonstration of Extra- and Intracellular Stages of Gregarine and Coccidian Protozoa (Dr J B Jennings), 473
Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of Penicillin (Dr J J Saukkonen), 816
Acidic Dissociation of 7 9-Dialkylguanines and its Possible Relation to Mutagenic Properties of Alkylating Agents (Dr P D Lawley and P Brookes), 1081
Ackers, G K , and Steere, R L A Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various Pore Sizes, 436
Acosta, A J , and others Simulated Wave-Riding Dolphins, 148
Acoustical Society of America Wallace Clement Sabine Award given to Dr Leo L Beranek, 507, 710
  Pioneers of Underwater Sound Award presented to Dr Albert B Wood, 507, 710
  Elections of Officers, 507
Acquired Immunity to Human Malaria Gamma-Globulin and (Dr S Cohen, Dr I A McGregor and S Carrington), 733
Acquired Tolerance to Homografts produced by Homologous Spleen Cell Injection in Adult Mice (Ronald D Guttmann and J Bradley Aust), 564
Acrolein and Mengo–Semliki Virus immunity (Dr George F Kamen), 986
Acs, Dr E Microwave Measurement Techniques (A New Instrument for the Measurement of Power), 409
Ács, Th , and others Role of the Thymus in Polysaccharide Metabolism, 1304
Action Mode of, of the Efferent Olivo-Cochlear Bundle on the Inner Ear (Dr J E Desmedt and Dr P Monaco), 1263
Action of Deoxyribonuclease and Ribonuclease on the Growth of Ehrlich Ascites Carcinoma in Mice (Dr Gaston de Lamirande), 52
Action of a Detergent (Dodecylbenzenesulphonate) on the Gills of the Trout (O J Schmid and H Mann), 675
Action of Liver Alcohol Dehydrogenase Mechanism of (Prof Hugo Theorell and Dr J S McKinley McKee), 47 , *erratum*, 710
Action of Methyl Hydroxybenzoate on Nervous Conduction (Dr P W Nathan and T A Sears), 668
Action of Penicillin Spheroplasts of Marine Bacteria induced by the (J R Boring and Prof D Pratt), 773
Action of Radiation on Synthesis of Deoxyribonucleic Acid in Normal and Tumour Strain Cells (Dr John Seed), 944, *erratum*, 1241
Action (A Carcinogenic), of Testosterone, provoking Uterine Tumours in Mice (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
Action (A Central), of 5-Hydroxytryptamine and Noradrenaline (Dr D R Curtis and Dr R Davis), 1083
Action (Coagulant), of Phospholipids A Correlation between Surface Charge and (Dr A D Bangham), 1197
Action (Hepatoxic), of Dialkylnitrosamines Mechanism of the (Dr D F Heath), 170
Action Nicotinic) Mechanism of, at the Adrenal Medulla—Calcium as a Link in Stimulus-secretion Coupling (Prof W W Douglas and R P Rubin), 1087
Action (Rectifying), of Non-uniform Fields in Dielectrics (Dr K C Kao), 650
Action (Streptomycin), on Bacteria Mechanism of—a Unitary Hypothesis (Dr Charles R Spotts and Prof R Y Stanier), 633
Action (Synergetic), of Polyethylene Glycol and Dyes Behaviour of Protozoa under the Influence of the (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Action Potential (Membrane), of the Heart Effects of Intensity of Driving Stimulus on the Shape of (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Activation of Vasodilator Activity in Human Plasma Role of Hageman Factor in the (Dr M E Webster and O D Ratnoff), 180

Activation (Heat-), and the Concept of Dormancy in the Bacterial Endospore Dipicolinic Acid Content, (A Keynan, W G Murrell and Prof H O Halvorson), 1211
Activation Energy in Solid State Reactions Definition of Rate Constant and (W Gomes), 865
Active Centres in Heterogeneous Catalysis Dislocations as (Ituro Uhara, Sadao Yanagimoto, Kazuo Tani and Gin'ya Adachi), 867
'Active' Magnesium Oxide Production of, by Heating in Vacuum (R Valverde and J P Saenz), 653
Active Materials (Biologically), in Coal (Martin H Rogoff and Irvine Wender), 378
Active Nitrogen Formation of, using Sources of Alternating Current and Direct Current (G G Mannella), 159
Activities (Comparative *in vitro*), of Phosphorylase *b* and Cytochrome Oxidase in Preparations from Two Ox Muscles (E J Briskey and R A Lawrie), 263
Activities (Research), in the Antarctic United States, 919
Activity of Deoxyribonuclease as related to Root-Growth (Dr R Goutier and M Goutier-Pirotte), 371
Activity of some Diphenyl Compounds on Winter Eggs of the Fruit Tree Red Spider Evaluation of the (J Meltzer), 474
Activity in Milk Analysis of the Relationship between Deposition of Long-lived Fission Products and Level of (Dr W Anderson, L K Burton and J O Crookall), 1009
Activity of Progesterone Effect of a Phospholipid Factor on the (Effect of Progesterone on Pregnancy), (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
Activity (Acylase), of Ascites Tumour Cells on Dichloroacetyl Derivatives of Amino-Acids (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
Activity (Antithrombin), of Normal and Pathological Cerebrospinal Fluid (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Activity (Auxin), in Ether-insoluble Fractions of Extracts of Rhubarb Petioles (B E S Gunning), 661
Activity (Biological), of a Soluble Ribonucleic Acid Conservation of the (J H Weil, Prof J P Ebel and R Monier), 169
Activity (Electrical), of the Cat Brain Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the (Dr Lj Mihailović and Dr B D Jankovic), 665
Activity (Electrical), of Single Cells (edited by Yasuji Katsuki), *review* by Dr P Fatt, 203
Activity (Glucose-6-Phosphate Dehydrogenase), in Papuans (Dr B P K Ryan and I C Parsons), 477
Activity (α-Glutamyl Peptidase) Histochemical Characterization of a Unique (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 339
Activity (γ-Glutamyl Transpeptidase-like) Histochemical Demonstration of (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 338
Activity (Growth-stimulating), of *Trans*-Caffeic Acid isolated from *Coleus rhenaltianus* (Dr J C Vendrig and K Buffel), 276
Activity (Growth Hormone), of the Anterior Pituitary Lobe of the Male Rat at various Ages (R H Bowman), 976
Activity (Haemolytic), of Streptolysins *O* and *S* in Agar-Gel Electrophoretic Mobility and Detection of (Extracellular Esterase of Group A Streptococci), (A H Stock and José Uriel), 435
Activity (High), against Type 2 Poliovirus Agents with (Dr D G O'Sullivan and Dr P W Sadler), 341
Activity (Hormone), in Brachyura Larvae Fluctuations in (John D Costlow, jun), 183
Activity (Inotropic), of Calcium Modification of the, by Potassium (Winifred G Nayler), 268
Activity (Lathyrogenic), *in vitro* (H Morag McCallum and Dr John Paul), 273
Activity (Lipase), in the Slow- and Fast-contracting Leg Muscles of the Cockroach (Prof J C George and N M G Bhakthan), 356
Activity (Œstrous-inducing), of Testosterone in the Ewe (D R Lindsay and Prof T J Robinson), 761
Activity (Oxidase), in the Saliva of a Plant-Bug (P W Miles and Ann Helliwell), 374
Activity (Peroxidase) Relationship between Tissue Eosinophils and (Tapio Rytomaa and Prof Harald Teir), 271
Activity (Puzzolanic), and Semiconductivity of Fired Kaolin and Kaolinitic Clay (A K Chatterji), 1180
Activity (Thromboplastic), of Red Cells (Prof Armand J Quick), 882 , (Dr James A Inglis and Dr June W Halliday), 882
Activity (Thyroid), at Higher Ambient Temperatures (Sukhen Chaudhuri and D P Sadhu), 560
Activity (Transaminase), in Arterial Tissue of the Rabbit (Dhurjati Prasad Chattopadhyay), 660
Activity (Vasodilator), in Human Plasma Role of Hageman Factor in the Activation of (Dr M E Webster and O D Ratnoff), 180
Actomyosin Adenosine Trophosphatase from Fresh, Frozen and Freeze-dried Beef Comparative Effects of 2,4-Dinitrophenol on the (L J N Cole), 1288
Acuminata (Genome) Relationship between 3,4-Dihydroxyphenylethylamine Content and the (L A Griffiths), 84
Acute Aortic Embolism Syndrome in Cats Production of Aortic Occlusion resembling (Roy K Imhoff), 979
Acute Radiation Diseases Problems of Infection, Immunity and Allergy in (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Acylase Activity of Ascites Tumour Cells on Dichloroacetyl Derivatives of Amino-Acids (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
Adachi, Gin'ya, and others Dislocations as Active Centres in Heterogeneous Catalysis, 867
Adal, M N , and others Muscle Receptors (Structure, Nerve Spectra and Distribution of Spindles in Cat Muscles), 806
Adams, Dr C W M A Perchloric Acid–Naphthoquinone Method for the Histochemical Localization of Cholesterol, 331
Adams, Dr P J Geology and Ceramics, 21
Adamson, Dr Colin *Obituary* of Prof Eric Bradshaw, 111
  Appointed to a newly created (second) chair of electrical engineering in the University of Manchester, 403 , work of, 403
Adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on Membrane Filters Influence of (N D Harris and J P Richards), 87
Addition to the List of Hydrolases in the Digestive Tract of Vertebrates Chitinase, an (Dr Charles Jeuniaux), 135
Adenine Nucleotides in Ion-Exchange Chromatography Effect of Charcoal on the Behaviour of (U Pethiyagoda), 452
Adenine Nucleotides in the Muscles of some Marine Invertebrates Changes in (Ken-ichi Arai and Tsuneyuki Saito), 451
Adenine and Adenosine Phosphates Demonstration of Interaction Products of, with Formaldehyde (Dr D L Woodhouse), 336
Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of Human Blood Platelets (A Gaarder, Dr J Jonsen, Prof S Laland, Dr A Hellem and Prof P A Owren), 531
Adenosine Phosphates (Adenine and) Demonstration of Interaction Products of, with Formaldehyde (Dr D L Woodhouse), 336
Adenosine Triphosphatase (Actomyosin), from Fresh, Frozen and Freeze-dried Beef Comparative Effects of 2,4-Dinitrophenol on the (L J N Cole), 1288
5′-Adenylic Acid Deaminase in Dystrophic Mouse Muscle (Dr R J Pennington), 884
Adhesiveness of Human Blood Platelets Adenosine Diphosphate in Red Cells as a Factor in the (A Gaarder, Dr J Jonsen, Prof A Laland Dr A Hellem and Prof P A Owren), 531
Adie, Dr R J The Falkland Islands, *review*, 853
Adkinson, Dr Burton W At the twenty-seventh Conference of the International Federation for Documentation (Tribute to the late Fritz Donker Duyvis), 219
Adlard, E R , and Whitham, B T Behaviour of 5A Molecular Sieve in Substractive Gas Chromatography, 966
Administration of Stilboestrol Dipropionate Seminal Degeneration induced in Merino Rams by the (G R Moule and P E Mattner), 364
Administration (Method of), and Effect of Progesterone (Effect of Progesterone on Pregnancy), (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329
Administration (Oral), of *Mycobacterium johnei* Susceptibility of Hamsters to the (N J L Gilmour and J G Brotherston), 1202
Admiralty (Services Electronics Research Laboratory Extension, Harlow) Promotion of J F Gittins to Senior Principal Scientific Officer, 214
Adorian, Paul Rocket Propulsion Thirty Years Ago, reprint, 308
Adrenal Cortex of the Female White Rat during the Œstrual Cycle Variations in the Nuclear Deoxyribonucleic Acid Content in the (E Brañez and H Roels), 1043
Adrenal Gland Stimulation of Uptake of Calcium-45 in the, by Acetylcholine (Prof W W Douglas and A M Poisner), 1299
Adrenal Medulla Mechanism of Nicotinic Action at the—Calcium as a Link in the Stimulus-secretion Coupling (Prof W W Douglas and R P Rubin), 1087
Adrenal (Rat) Slices *in vitro* Enhancement of Steroidogenesis by, with Œstradiol-17-β (Prof Julian I Kitay), 358
Adrenalone Inhibition of Dopamine β Oxidase by (Prof M Goldstein and J F Contrera), 1081
Adrenotropic Mouse Pituitary Tumours (Thyrotropic and) Difference in Metabolism of Labelled Thyroxine between (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Adult Brothers Anthropometric Correlations between (Prof Eugene Schreider), 1311
Adult Living Mice (New-born and) Identification of the Chromosome Complements of (R G Edwards), 1316
Adult Mice Acquired Tolerance to Homografts produced by Homologous Spleen Cell Injection in (Ronald D Guttmann and J Bradley Aust), 564
  Mast Cell Turn-over in (Prof Bruce E Walker), 980
Adult Size and Fecundity in the Moth *Panaxia dominula* L Influence of Larvel Environment on (L M Cook), 282
Adults and Hypopituitary Dwarfs Growth Hormone Content of Serum in Infants, Children, (Dr J Girard, Dr M Vest and Dr N Roth), 1051
Advanced Organic Chemistry (Prof G W Wheland), third edition, *review* by Dr D T Lewis, 835
Advances in Enzymology and related Subjects of Biochemistry (edited by F F Nord), Vol 22, *review* by Dr E C Webb, 854
Advances in the Generation and Use of Very High, Continuous Magnetic Fields (Dr Henry H Kolm), 299
Advances in Veterinary Science (edited by C A Brandly and E J Jungherr), Vol 6, *review* by Prof Harold Burrow, 198
Advances (Conceptual), in Immunology and Oncology (University of Texas Sixteenth Annual Symposium on Fundamental Cancer Research), 1132
Advantage (Segregation-ratio), of Abnormal Haemoglobins (L N Went), 382
Adventitious Rooting Structure of the Plant Stem in relation to (A Beryl Beakbane), 954
Advisory Council on Scientific Policy (Statistics Committee) Survey on the Long-Term Demand for Scientific Manpower, 293
Aerodynamik (Mechanik, Hydro- und) Gesammelte Abhandlungen zur Angewandten (Ludwig Prandtl), (herausgegeben von Walter Tollmien, Hermann Schlichting und Henry Gortler , schriftlietung F W Riegels), Teile 1-3, *review* by M James Lighthill, 841
Aeronautics, College of (Cranfield) Appointment of Dr R L, Apps as lecturer in the Department of Materials, 406
  Appointment of A G Simms as lecturer in the Department of Production and Industrial Administration, 406
  Appointment of J W Mair as Research Fellow in the Department of Materials, 406
  Appointment of Dr A Younger as Research Fellow in the Department of Materials, 406
Aetiology of Alcoholism—Controlled Observations, *review* by Dr W McAdam, 848
Affairs (World) Seventh Pugwash Conference on Science and (International Co operation in Pure and Applied Science), 1232
Affonso, Dr O R , and others Paper Electrophoresis, *review* by Dr G V F Seaman, 593
  Effect of Colchicine on Rat Liver Xanthine Oxidase, 666
Africa South of the Sahara (Ethiopian Region) The Arthropod Parasites of Vertebrates in, Vol 1, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222

INDEX

Africa (East) Age of the Basalt Flow at Olduvai (Prof G H R von Koenigswald, Prof W Gentner and H J Lippolt), 720
  O'Nyong-nyong Fever, an Epidemic of Virus Disease in, 30
Africa (East) High Commission East African Virus Research Institute Report (1959-1960), 30
Africa (West) Sorghum Midge, *Contarinia sorghicola* (Coq), in (K M Harris), 187
African Vertebrates The Mites and Tongue-Worms of, *review* by Dr F A Turk, 1222
African (Central) Freshwater Fishes Feeding Habit of some (H Matthes), 78
African (East) Virus Research Institute Report (1959-1960), 30
African (South) Institute for Medical Research Publications, No 1, Vol 9, The Arthropod Parasites of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol 1, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
African (West) Fisheries Preliminary Bionomic Data from (Trawl Fishing in the Tropical Atlantic), (Alan R Longhurst), 621
Africans (Native) Distribution of Group-specific Components (*Gc*) in the Sera of (Dr Jan Hirschfeld and Jean Sonnet), 766
After-discharge (Repetitive), produced by Drugs in Nerves treated with Cetyltrimethylammonium Bromide (Michiko Okamoto and Prof Albert S Kuperman), 365
Agar-Gel Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins *O* and *S* in (Extracellular Esterase of Group A Streptococci), (A H Stock and Jose Uriel), 435
Agar Gels of various Pore Sizes A Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through (G K Ackers and R L Steere), 436
AGARD (N A T O), and the University of Southampton Seminar on Astronautics, 310
AGARDograph No 47, Gas Sampling and Chemical Analysis in Combustion Processes (Prof G Tine), *review* by Dr C F Cullis, 1108
Agarophoresis and Immuno-electrophoresis of the Proteins of Gastric Juice (M Tenorova, E Stuchlíkova and J Kořinek), 763
Agarwal, Saroj Synergid Haustoria of *Quinchamalian chilense* Lam , 1313
Agarwala, O N , and others Feeding of Bamboo Flowers to Laboratory Rats and Mice, 470
Age of the Basalt Flow at Olduvai, East Africa (Prof G H R von Koenigswald, Prof W Gentner and H J Lippolt), 720
Age of Host Cellular Dose and, in the Induction of Tolerance (Dr L Brent and Dr G Gowland), 1265
Age of Mice Influence of, on the Recovery from Experimental Sendai Virus Infection (Dr Leon Sawicki), 1258
Age of Pollen and Stigmas Influence of the, on Sex Determination in Hemp (Regina Laskowska), 147
Age (Absolute), of Pleistocene and Holocene Deposits in the Haua Fteah (Dr C B M McBurney), 685
Age-Cultures (Different), of *Escherichia coli K12* Effect of Ultra-Violet Radiation and Desiccation on (I L Mulay and G S Sperti), 773
Age Determination Uranium in the Sikhote–Alin Meteorite and its relation to the Lead Method of (Edward L Fireman and David E Fisher), 644
Age Determinations of Rocks in the Lizard (Cornwall) Area (J A Miller and D H Green), 1175
Age Determinations (Potassium–Argon), on Granite from the Island of Mahé in the Seychelles Archipelago (J A Miller and J D Mudie), 1174
Age and Pregnancy Effect of, on the Tolerance of Tsetse Flies to Insecticides (G F Burnett), 188
Ageing Protection Fundamental and Practical Approaches to (Natural Rubber Producers' Research Association Symposium on), 115
Agents with High Activity against Type 2 Poliovirus (Dr D G O'Sullivan and Dr P W Sadler), 341
Agents (Alkylating) Acidic Dissociation of 7 9-Dialkylguanines and its Possible Relation to Mutagenic Properties of (Dr P D Lawley and P Brookes), 1081
Ages Growth Hormone Activity of the Anterior Pituitary Lobe of the Male Rat at various (R H Bowman), 976
Ages (Potassium–Argon), at Broken Hill, Australia (Dr J F Evernden and Dr J R Richards), 446
Agglutination and the Electrical Surface Potential of Red Blood Cells (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Agricultural Bureaux, Commonwealth Appointment of Dr V Armstrong as chairman, 507
Agricultural Chemicals, Association of British Manufacturers of British Insecticide and Fungicide Conference, 406, 1140
Agricultural Merit Commander of the Order of (Honour conferred on Sir John Russell by the French Minister of Agriculture on the occasion of the bicentenary of the French Academy of Agriculture), 1132
Agricultural Problems in Developing Countries (Nutrition Society Symposium on), 1028
Agricultural Research, Indian Council of Entomological Monographs No 1, Contributions to the Systematics of Oriental Termites (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Agricultural Research Council Appointment of Prof W T Williams as a member, 213
  Promotion of Dr R Markham (of the A R C Virus Research Unit, Cambridge) to Deputy Chief Scientific Officer, 215
  Iodine-131 in Milk in Britain, 504, 707
Agricultural Society of England (Royal) Medal and Award for research on Agriculture, 609
Agriculture Research on (Royal Agricultural Society of England Medal and Award for), 609
  Venturicidin, a New Antifungal Antibiotic of Potential Use in (A Rhodes, K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
Agriculture and Fisheries, Department of, for Scotland Milk Powder, 607
Agriculture, Fisheries and Food, Ministry of Domestic Food Consumption and Expenditure, 1959—Annual Report of the National Food Survey Committee, 317
  Milk Powder, 607
Agriculture and Food Storage Toxic Chemicals in, 1130
Agriculture (Food and), 1961 The State of (United Nations, Food and Agriculture Organization), 1028
Agriculture (Food and), in Developing Countries (Prof A H Bunting), 1028
Agriculture (Industry and), Institute for the Encouragement of Scientific Research in (Brussels) Annual Report for 1960, 28
Ahlfors, Prof Lars V , and Sario, Prof Leo Riemann Surfaces, *review* by Prof W K Hayman, 847
Ahmed, K S (Abramovitch, Prof R A , and) Oxidative Decarboxylation of Indole-3-acetic Acid by Mangani-Versene and by Wheat Leaf Enzyme, 259
Air (Real Gas Equilibrium Flow of), in Hypervelocity Test Facilities with Total Temperatures to 10,000° K Mach Tables for (K L Goin), 308
Air Force Cambridge Research Laboratories (United States), Bedford, Mass Changes at the, 307
Air–Water Froths Formation of (J Rennie and W Smith), 419
Air-filled Elastic System Oscillatory Flow in an (Group-Capt J E Malcolm), 875
Aircraft Establishment (Royal), Farnborough Promotion of Prof J C Cooke to Senior Principal Scientific Officer, 214
  Promotion of R J Atkinson to Deputy Chief Scientific Officer, and head of the Structures Department, 306
Airy Functions and Special Confluent Hypergeometric Functions for Asymptotic Solutions of Differential Equations of the Second Order Tables of (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Ajello, Dr Libero Histoplasmosis, 114
Akeroyd, Colonel Joseph H , and others Quantitative Sub-Groups of the B Antigen in Man and their Occurrence in Three Racial Groups, 1196
Alarmed Mice Peroxide-like Substance in (V J Horgan and J St L Philpot), 662
Albertsson, Per-Åke, and others Separation of Bacteria by Counter-Current Distribution, 236
Albino Rat Free Amino-Acids in Rachitic Epiphyseal Cartilage of, and the Influence of Vitamin D (G V G Krishna Rao), 269
Albrecht, Dr P (Libíkova, Dr H , and) Reproduction of Tick-borne Encephalitis Virus in HeLa Cells, 779
Albumin Binding Antigenicity of Penicillin and its relation to (Dr Toshio Torii and Dr Yoshihi Kohoriuchi), 429
Albumin Catabolism (Plasma), in Experimental Nephrosis (Dr Alvin L Sellers, Joseph Katz and Sheldon Rosenfeld), 562
Albumin Solutions (Bovine Serum) Nuclear Magnetic Resonance Spectroscopy of Proteins—the Hydrogen Bonding of Water in (F A Bovey), 324
Alcohol Dehydrogenase (Liver) Mechanism of Action of (Prof Hugo Theorell and Dr J S McKinley McKee), 47 , *erratum*, 710
Alcohol Studies, Center of Transferred from Yale University to Rutgers State University, 404
Alcoholism Aetiology of—Controlled Observations, *review* by Dr W McAdam, 848
  Origins of (William McCord and Joan McCord, with Jon Gudeman), *review* by Dr W McAdam, 848
Alcohols Effect of Strong Electrical Fields on the Boiling Points of some (Richard K Lyon), 1285 , (Dr P K Katti and M M Chaudhri), 1286
Alcohols (Solid Secondary) A Transition in the Dielectric Properties of (J S Dryden and H K Welsh), 255
Alder (*Alnus glutinosa* Gaertn) Molybdenum and Symbiotic Nitrogen Fixation by (Dr J H Becking), 1204
Alderman, Prof A R , and von der Borch, C C Occurrence of Magnesite-Dolomite Sediments in South Australia, 861
Alderson, Dr T Molecular Biology and Population Structure (Structure of Deoxyribonucleic Acid), 414
Aldosterone Effect of, on the Living Cornea *in vitro* (Dr A Donn, Dr M G Rosenblatt and Dr N P Christy), 73
Alekseyeva O G , and others Problems of Infection, Immunity and Allergy in Acute Radiation Diseases (translated from the Russian by Lydia Venters , edited by R Clarke), *review* by Dr Hugh D Evans, 6
Alexander, Dr P and Mikulski, Z B Mouse Lymphoma Cells with Different Radiosensitivities, 572
Alexander, W M , and others Direct Measurement of Interplanetary Dust Particles in the Vicinity of Earth, 441
Alfred, Lawrence J , and others Cytopathic Protective Factor, its Production by Normal Uninfected Serum-free Cell Cultures, 1101
Alga (Brown), *Ecklonia radiata* Seasonal Variation in Alginic Acid, Mannitol, Laminarin and Fucoidin in the (C M Stewart, H G Higgins and Sue Austin), 1208
Algae Blue-Green—Growth (Dr J S Bunt), 1274 , Isolation of Bacteria-free Cultures from Hormogone-producing Blue-Green Algae (Dr J S Bunt), 1275 , Use of Antibiotics to purify Blue-Green Algae (Dr Y T Tchan and J Gould), 1276
Algae (Blue-Green) Isolation of Bacteria-free Cultures from Hormogone-producing (Blue-Green Algae), (Dr J S Bunt), 1275
  Use of Antibiotics to purify (Blue-Green Algae), (Dr Y T Tchan and J Gould), 1276
Algae (Nitrogen-fixing Blue-Green), in Australian Rice Soils (Dr J S Bunt), 479
Algae (Red) New Ninhydrin-Reactive Substance from (Mitsuo Kuriyama), 969
Algal Cell Walls Variants in the Structural Polysaccharides of (Dr Eva Frei and Prof R D Preston), 939
Algebra Commutative (Prof Oscar Zariski and Prof Pierre Samuel), Vol 2, review by Prof L S Goddard, 855
Algebras Infinite-Dimensional, *review* by Dr F Smithies, 201
Algerian Ivy Effect of Temperature and Potassium Gibberellate on Phases of Growth of (J R Goodin and Prof V T Stoutemyer), 677
Alginase Hydrolysate A New Unsaturated Uronide isolated from (Isami Tsujino and Tsuneyuki Saito), 970
Alginic Acid, Mannitol, Laminarin and Fucoidin in the Brown Alga, *Ecklonia radiata* Seasonal Variation in (C M Stewart, H G Higgins and Sue Austin), 1208
Ali, Dr S M History of Sciences in Ancient and Medieval India (Geographical Ideas of the Hindus), 27
Alkali Metal Titanium Oxide Bronzes (A D Wadsley and Sten Andersson), 551
Alkali-resistant Haemoglobins in Prosimian Primates (Prof John Buettner-Janusch and Joseph B Twichell), 669
Alkaline Phosphatase (A Zinc-requiring), in the Ventral Lobe of the Rat Prostate (Leonora Hopkinson and J C N, Wakeley), 357

INDEX

Alkyl Phosphonic and Alkyl Phosphonothionic Acids Hydrogen Bonding in (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Alkyl Phosphonothionic Acids (Alkyl Phosphonic and) Hydrogen Bonding in (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Alkylating Agents Acidic Dissociation of 7 9-Dialkylguanines and its Possible Relation to Mutagenic Properties of (Dr P D Lawley and P Brookes), 1081
Allan, Dr D A The Royal Scottish Museum, 215
  Dunfermline Museum opened by, 921
Allan, D L Proceedings of the International Conference on Nuclear Structure, *review*, 203
Allan, Dr H H Flora of New Zealand, Vol I, Indigenous Traecheophuya, Psilopsida, Lycopsida, Filicopsida, Gymnospermae, Dicotyledones, *review* by Dr George Taylor, 1108
Allan, J E At the Third Australian Spectroscopy Conference (Recent Developments in the Technique of Atomic Absorption Spectroscopy), 929
Allen, B Metallurgy of Beryllium, 1138
Allen, Dr Clifford Student Mental Health, 620
Allen, P G M, and others Evolution of Hydrocarbons from Impure Titanium Getters, 749
Allergen in Green Coffee Bean Chlorogenic Acid, an (Dr S O Freedman, J Krupey and A H Sehon), 241
Allergy to a Carbon-Functional Organic Silicon Compound, Dimethyldi-(4-hydroxyphenyl)-silane (Dr Sigfrid Fregert and Dr Hans Rorsman), 989
Allergy (Infection, Immunity and), in Acute Radiation Diseases Problems of (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Allibone, Dr T E *Obituary* of Dr B L Goodlet, 1237
Allison, Dr A C Haemoglobin, Normal and Abnormal, *review*, 835
Alloxan D-Penicillamine as an Antidote to 8-Hydroxyquinoline and (Makoto Matsuda and Prof Katashi Makino), 261
Alloys (Iron–Nickel) A New Reversible Solid-State Transformation in, in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavler), 962
Allsopp, Dr A The Growing Tip of Plants, *review*, 830
Almanacs Astronomical and Nautical, 1240
Almquist, Prof J O (Saacke, R G, and) Freeze-drying of Bovine Spermatozoa, 995
Alnus glutinosa Gaertn (Alder) Molybdenum and Symbiotic Nitrogen Fixation by (Dr J H Becking), 1204
α-Chain of Human Haemoglobin Chromium-51 Tagging of the (Prof Amoz I Chernoff), 327
α_1-Globulin Isolation of an, from Human Plasma (Dr M Steinbuch and Dr J Loeb), 1196
α-Glutamyl Peptidase Activity Histochemical Characterization of a Unique (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 339
α-Hydroxyethylamide (Lysergic Acid) Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of, by *Claviceps paspali* Stevens and Hall (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
α-Keratin Structure of (Prof S Krimm), 810
α-Manganese Phases containing Technetium-99 (D J Lam, J B Darby, jun, J W Downey and L J Norton), 744
α-Sulphoquinovosides Hydrolysis of, by β-Galactosidase (Isao Shibuya and Prof A A Benson), 1186
Alteration (Experimental), of the Speech-rate, 921
Alterations in Connective Tissue and Intestine produced by Hypervitaminosis A in *Xenopus laevis* (Gerald Weissmann), 235
Alterations (Ultrastructural), during the Crabtree Effect in Rous Sarcoma Cells (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
Alternating Current and Direct Current Formation of Active Nitrogen using Sources of (G G Mannella), 159
Alternating Temperature Requirement for Germination Replacement of an, by Gibberellic Acid (J M Tager and Brenda Clarke), 83
Alteration of Permeability of *Lactobacillus plantarum* caused by Chlorpromazine (Dr Helene A Nathan), 471
Altman, Philip L (Analysis and compilation by) Blood and other Body Fluids (edited by Dorothy S Dittmer), *review* by Sir Hans Krebs, 591
Alumina (Platinum–) Catalysts Valence State of (R J Bertolacini), 1179
Alvarenga Prize of the College of Physicians of Philadelphia awarded to Prof Seymour S Kety, 21
Amano, Kazua, and others Autonomic Nervous System and the Occurrence of Visceral Lesions, 1025
Amateur in Science The, 95
Ambient Temperature and Depot Fat Iodine Number in Children (I Macdonald), 363
Ambient Temperatures (Higher) Thyroid Activity at (Sukhen Chaudhuri and D P Sadhu), 560
Amblyopia (Suppression) Re-educative Treatment of (Being an abridged English version of Jean Sédan's 'Post Cure de l'Amblyope Rééduqué'), (T Keith Lyle, Cynthia Douthwaite and Jill Wilkinson), *review* by Prof O L Zangwill, 695
America, Electron Microscope Society of Nineteenth Annual Meeting, 610
  Symposium on the Contribution of Electron Microscopy to Polymer Morphology, 610
  Symposium on Ultrastructure of Protein Fibers—Collagen, Muscle and Keratin, 610
  Symposium on the Fine Structure of Viruses, 611
America (Latin) Cosmic Ray Research in (Dr H Elliot), 121
America (North) Transmission of Clover Phyllody Virus by *Aphrodes bicinctus* (Schrank) in (Dr L N Chiykowski), 581
America (North), Plant Phenolic Group of Inaugural Meeting, 418
  Symposium on the Biochemistry of Plant Phenolic Substances, 418
  Election of Officers, 418
American Association for the Advancement of Science 128th Meeting, 213
  AAAS Transliteration System, 405
American Academy of Arts and Sciences Records of the Academy (1960-61), 5[illegible]5
American Ephemeris and Nautical Almanac for 1962, 1240
American Foundation for Mental Hygiene *Mental Health Book Review Index*, Vol 6, No 11, 113
American Institute of Biological Sciences Biological Sciences Curriculum Study Bulletin No I, Biological Education in American Secondary Schools, 1890-1960 (Dr Paul De Hart Hurd), *review*, 1007
American Institute of Electrical Engineers David Sarnoff Award in Electronics presented to Dr C H Townes, 606
American Institute of Physics John T Tate Medal awarded to Dr P Rosbaud, 112
American Mathematical Society Sixty-eighth Annual Meeting, in conjunction with the Annual Meeting of the Mathematical Association of America, 609, 1026
American Philosophical Society Memoirs, Vol 51, Population Redistribution and Economic Growth, United States, 1870-1950 (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grebenik, 853
American Rocket Society Spaceflight Report to the Nation, 1244
American Secondary Schools Biological Education in 1890-1960 (Dr Paul De Hart Hurd), *review*, 1007
American Tapestry of Statistics, *review* by Dr D E Barton, 846
2,7-di-(*m*-Amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium Chloride Dihydrochloride (*M* & *B* 4596) A New Prophylactic Trypanocidal Drug (S S Berg, K N Brown, J Hill and W R Wragg), 367
Amidopyrine Anti-Asthmatic Effect of Phenazone and (H Herxheimer and E Stresemann), 1089
Amin, A Comparison of the Serum Protein Fractions of the Developing Chicken Embryo by the Technique of Starch-Gel Electrophoresis, 356
Amino-Acid Effects of Irradiation on the Incorporation of, into Normal and Regenerating Rat Liver (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Amino-Acid Composition of Bovine Growth Hormone Determination of the (Dr Alan J Parcells), 971
Amino-Acid Composition of the Polypeptide Chains of Gorilla Haemoglobin (Emile Zuckerkandl and W A Schroeder), 984
Amino-Acid Metabolism New Renal Tubular Amino-Acid Transport System and a New Hereditary Disorder of (Dr C R Scriver, I A Schafer and M L Efron), 672
D-Amino-Acid Oxidase and 'Substrate-Substitute' Crystallization of the Complex of (Kunio Yagi and Takayuki Ozawa), 70
Amino-Acid Sequence The Complete (Amino-Acid Sequence of Horse Heart Cytochrome *c*), (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125
Amino-Acid Sequence of Horse Heart Cytochrome *c*—Peptides released by Digestion with Chymotrypsin (Dr E Margoliash and Prof Emil L Smith), 1121, Peptides, Terminal and Internal, released by Digestion with Trypsin (Dr G Kreil and Prof H Tuppy), 1123, The Complete Amino-Acid Sequence (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125
Amino-Acid Transport System (New Renal Tubular), and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
Amino-Acids Acylase Activity of Ascites Tumour Cells on Dichloroacetyl Derivatives of (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
  Effect of Plant Growth Compounds on Uptake of, by Plant Roots (D E Wright), 1044
  Separation of Low Molecular Weight Peptides from, on 'DEAE-Sephadex' (P R Carnegie), 658
Amino-Acids in Brain Phenylalanine as Inhibitor of Transport of (K D Neame), 173
Amino-Acids in Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin in Glucose Uptake and Intracellular Accumulation of (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Amino-Acids (Free), in Rachitic Epiphyseal Cartilage of Albino Rat and the Influence of Vitamin D (G V G Krishna Rao), 269
Amino-Acids (Protein-bound), *in vivo* Quantitative Aspects of the Re-Utilization of (Dr H Walter and H Zipper), 1292
Amino-Acids (Sulphur) Effects of the, on the Vitamin A Content in Liver of Rats (Tatsuo Koyanagi and Satoshi Odagiri), 168
Aminoacetonitrile on Fibroblast Cultures Cytotoxic Effect of, and its Prevention by Histidine (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Amir, S M, and others Some Tetrahydropyranyl Derivatives of Glycine Serine and Urea, 1069
Ammonia—Manufacture and Uses (Dr A J Harding), *review* by Dr M J Newlands, 902
Ammonium Perchlorate Thermal Decomposition of, in presence of Zinc Oxide (Dr F Solymosi and L Révész), 64
Ammonium Sulphate (Neutron-Irradiated) Behaviour of, on Thermal Annealing (Dr Nikola Getoff and Masaru Nishikawa), 61
Amoeba Evidence for a Sexual Phase in the Life-Cycle of an (M R Droop), 281, *erratum*, 507
Amoebae (Soil) Biotin, a Growth Requirement for Four (R N Band), 674
Amoebic Hepatitis Establishment of, as a Distinct Clinico-Pathological Entity (Prof Th Doxiadis and Prof N Candreviotis), 988
Amounts of Oxides of Nitrogen and Carbon Monoxide in Cigarette Smoke, with and without Inhalation (C Bokhoven and H J Niessen), 458
Amphetamine–Barbiturate Mixture Modification of the Effects of an, by the Past Experience of Rats (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson), 533
Amphibian Morphogenesis Role of Water-regulating Mechanisms in—a Quantitative Hypothesis (Peter Tuft), 1049
Amsterdam Conference on Particle Accelerators, 123
Amylobarbitone Metabolite in Human Urine Identification of an (J V Jackson and M S Moss), 553
Anaemia (Fanconi Type) Foetal Haemoglobin in (Dr J H Jones), 982
Anaemias (Tropical) Grants for Research on (Wellcome Trust), 211
Anaerobic Glycolysis Influence of, on Release of Histamine in the Guinea Pig and Rat Anaphylactic Reaction *in vitro* (A Prouvost-Danon and Dr H Moussatché), 361
Anaerobiosis and Sodium Accumulation (James E Leggett and Lewis H Stolzy), 991
Analgetic Antagonist A New Potent (Maxwell Gordon, John J Lafferty, David H Tedeschi, Nathan B Eddy and Everette L May), 1089
Analog Computer Components Design Fundamentals of (Prof R M Howe), *review* by Dr M V Wilkes, 489
Analyser The Microsan X-Ray (Cambridge Instrument Co, Ltd), 220

Analyser (Probability Distribution), programmed for Neurophysiological Research (Dr W R Levick, Prof P O Bishop, W O Williams and Prof D G Lampard), 629
Analysis Quantitative Inorganic (Prof R Belcher and Dr A J Nutten), second edition, *review* by Dr G Kakabadse, 836
Analysis of Combustion Products Sampling and, *review* by Dr C. F Cullis, 1108
Analysis of the Relationship between Deposition of Long-lived Fission Products and Level of Activity in Milk (Dr W Anderson, L K Burton and J O Crookall), 1009
Analysis on Riemann Surfaces, *review* by Prof W K Hayman, 847
Analysis (Chemical) Physical Methods in (edited by Walter G Berl), Vol I, second edition, *review* by Dr D T Lewis, 391
Analysis (Chemical), in Combustion Processes Gas Sampling and (Prof G Tiné), *review* by Dr C F Cullis, 1108
Analysis (Combustion), of Paper Chromatographic Spots (H Soep), 67
Analysis (Cross-Sectional) Validity of Prediction based on (Gwynneth de la Mare and R Sergean), 1318
Analysis (Crystal Structure) The Theory of (A I Kitaigorodskii), translated from the Russian by David and Katherine Harker, *review* by Dr M M Woolfson, 904
Analysis (Functional) Elements of (L A Liusternik and V J Sobolev), translated from the Russian by Anthony E Labarre, Jr, Herbert Izbicki and H Ward Crowley, *review* by Dr J C Burkill, 491
Analysis (Inorganic Chemical) Text-Book of, *review* by Dr G Kakabadse, 836
Analysis (Local Chemical), of Human Tissue A New Method for (Robert C Mellors and Kenneth G Carroll), 1090
Analysis (Rotational) of ^{45}Cu ^{35}Cl Bands (Prof R K Asundi, P Ramakoteswara Rao and J K Brody), 444
Analysis (Rotational), of the $A^2\Pi - X^2\Sigma^+$ System of MgCl (E Morgan and Dr R F Barrow), 1182
Analytical Chemistry Summer School in, at the Manchester College of Science and Technology (Royal Institute of Chemistry), 608
Analytical Chemistry of the Rare Earths (Dr R C Vickery), *review* by Dr D T Lewis, 593
Analytical Instrumentation, *review* by Dr D T Lewis, 391
Ananthanarayanan, Prof N I, and Peavler, R J A New Reversible Solid-State Transformation in Iron–Nickel Alloys in the Invar Range of Compositions, 962
Anaphylactic Hypersensitivity Transfer of Immediate, by Homologous Bone Marrow or Spleen Cells (Dr V Stankovic and S Vlahović), 762
Anaphylactic Reaction (Guinea Pig and Rat), *in vitro* Influence of Anaerobic Glycolysis on Release of Histamine in the (A Prouvost-Danon and Dr H Moussatché), 361
Anaphylactic Sensitivity A New Test for detecting—the Basophil Reaction (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
Anatomical Society of Great Britain and Ireland Annual General Meeting (Papers on Cytology of Nervous Tissue), 406
Anatomie (Mikroskopische), des Menschen Histologie und (Prof W Bargmann), dritte Auflage, *review* by Dr. F Jacoby, 1007
Anatomists Proceedings of the Symposium held during the Seventh International Congress of (New York, 1960)—The Structure of the Eye (edited by George K Smelser), *review* by Dr E N Willmer, 295
Anatomy and Histology of the Eye and Orbit in Domestic Animals (Prof Jack H Prince, Prof Charles D Diesem, Prof Irma Eglitis and Gordon L Ruskell), *review* by Dr E N Willmer, 295
Anbar, M, and others Deiodination of Thyroxine-^{131}I in Tumour-bearing Rats, 1303
Ancient Seas Life and its Environment in (British Association for the Advancement of Science, Section C (Geology) and Section D (Zoology), Joint Discussion on), 925
Ancient and Medieval India History of Sciences in (National Institute of Sciences of India Symposium on), 27
Anderson, A J, and others Survival of *Rhizobium* on Clover Seeds, 526
Anderson, Dr A P (Brown, Dr J, and) Microwave Measurement Techniques (Use of a Single Crystal as a Harmonic Generator and as a Detector at a Wave-length of 4 mm), 410
Anderson, Dr J C Appointed reader in electrical engineering at the Imperial College of Science and Technology, London, 1132
Anderson, Prof M L *Obituary* by Dr C J Taylor, 502
Anderson, M V (Culshaw, Dr W, and) Microwave Measurement Techniques (Fabry-Pérot Interferometers and their use for the Measurement of Permittivity of such Substances as TiO$_2$), 410
Anderson, Dr P W Elected to an Overseas Fellowship at Churchill College, Cambridge, 710
Anderson, R S Diuresis due to Stress in Cattle, 460
Anderson, Dr W, and others Analysis of the Relationship between Deposition of Long-lived Fission Products and Level of Activity in Milk, 1009
Andersson, Sten (Wadsley, A D, and) Alkali Metal Titanium Oxide Bronzes, 551
Andrade, Prof E N da C At the Rutherford Jubilee International Conference on Nuclear Physics, 794
Andrew, C Appointed lecturer in mechanical engineering at the University of Bristol, 710
Andrews, Jr, Prof Henry N . Studies in Paleobotany, *review* by Dr Alan Wesley, 852
Androst-16-en-3α-ol and related Steroids Gas Chromatography of (R W R Baker and Dr D B Gower), 1074
Anesey, J, with Cohen, J (Veis, A, and) At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Production of Gelatin Fractions from Skin Collagens, and their Re-Constitution as Fibres), 613
Aneurisms (Dissecting), of the Large Arteries of Chick Embryos due to (Sweet Pea) Lathyrism (Z Zahoř and M Machova) 532
Angara–Yenesei Hydroelectric Schemes (P M Dmitrievsky), 114
Angevine, jun, Dr J B, and Sidman, R L Autoradiographic Study of Cell Migration during Histogenesis of Cerebral Cortex in the Mouse, 766
Angiosperms Prof A J Eames and the Morphology of the (Prof F C. Steward), 8
Angular Momentum of Continua (Prof J S Dahler and Prof L. E Scriven), 36
Animal Behaviour (British Association for the Advancement of Science, Section J (Psychology), Symposium on), 208
Animal Life The Soil as an Environment for (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 315
Animal Parasites in Man (Dr N H Swellengrebel and M M Sterman), *review* by Dr G Lapage, 197
Animal Protein in the Diet Cystine Content in Hair of Children as influenced by Vitamin A and (Tatsuo Koyanagi and Teru Takanohashi), 457
Animal Virus Chromosomal Aberrations induced by an (Dr Berge Hampar and Dr Solon A Ellison), 145
Animals Distribution of Trypsin Inhibitors in the Sera of various (S Nakamura and T Wakeyama), 1077
Animals incapable of Synthesizing the Vitamin Biosynthesis of L-Ascorbic Acid—Missing Steps in (I B Chatterjee, N C Kar, N C Ghosh and Prof B C Guha), 163
Animals (Domestic) Anatomy and Histology of the Eye and Orbit in (Prof Jack H Prince, Prof Charles D Diesem, Prof Irma Eglitis and Gordon L Ruskell), *review* by Dr E N Willmer, 295
Animals (Hibernating) Sodium and Potassium Content in the Muscles of (Dr Einar Eliassen and Helge Leivestad), 459
Animals (Precipitation, Soil and), in Norway Caesium-137 and Strontium-99 in (T Hvinden and A Lillegraven), 1144
Animals (Social) Insects as, 801
Annealing (Thermal) Behaviour of Neutron-Irradiated Ammonium Sulphate on (Dr Nikola Getoff and Masaru Nishikawa), 61
Annelid (Enchytraeid) Axenic Cultivation of an (Dr Ellsworth C Dougherty and Bjørn Solberg) 184
Annett, Dr J Teaching Machines (The Main Requirements for a Teaching Machine), 105
Annual of the British School at Athens, No 55, 1960, *review* by Joan Liversidge 851
Anode Concentration Polarization Evaluation of Boundary Layer Thickness in Electrolytic Systems from Decay of (Leonard Nanis), 449
Anomalous Rayleigh Scattering : Lattice-like Vibrations in Associated Liquids and the Origin of (J K Wilmshurst), 1061
Anstey, Edgar Elected president of the International Scientific Film Association, 514
Antagonism between Antibacterial Drugs (A Manten and W J Wisse), 671
Antagonism of Reserpine by Intraventricular Bretylium (Stata Norton and Kenneth I Colville), 72
Antagonist A New Potent Analgetic (Maxwell Gordon, John J Lafferty, David H Tedeschi, Nathan B Eddy and Everette L May), 1089
Antarctic United States Research Activities in the, 919
Antarctic Expedition (The Royal Society International Geophysical Year), Halley Bay, Coats Land, Falkland Islands Dependencies, 1955-1959 (General Editor, Sir David Brunt), Vol 1, Introductions, Aurora and Airglow, Geomagnetism, *review* by Dr R Stoneley, 1004
Antennary Feeding of the Hermit Crab *Diogenes brevirostris* Stimpson (R E Boltt), 1099
Anterior Pituitary Lobe of the Male Rat at various Ages Growth Hormone Activity of the (R H Bowman), 976
Anthers (*Tradescantia*), cultured in Media Deficient in Sugar Kinetin-induced Meiotic-Prophase Acceleration and Stasis in (Prof G W R Walker and J Dietrich), 889
Anthology An Arachnological, *review* by Dr E Duffey, 829
Anthropometric Correlations between Adult Brothers (Prof Eugene Schreider), 1311
Anti-Asthmatic Effect of Phenazone and Amidopyrine (H Herxheimer and E Stresemann), 1089
Antibacterial Drugs Antagonism between (A Manten and W J Wisse), 671
Antibacterial Synthetic Polypeptide Derivatives (Dr K Kovacs, Dr A. Kotai, I Szabo and R Mecseki), 190
Antibiosis among Lactobacilli (H C de Klerk and Prof J N Coetzee), 340
Antibiotic (New Antifungal), of Potential Use in Agriculture Venturicidin, a (A Rhodes K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
Antibiotic Fermentation A Potent, Non-Toxic Plant-Growth Inhibitor from an (Dr L G Nickell and W D Celmer), 1098
Antibiotic Literature Survey of, *review* by Dr B K Kelly, 589
Antibiotic Properties of Mycelium and Metabolites of *Myrothecium roridum* Tode (Andrzej Nespiak, Marian Kocor and Antoni Siewinski), 138
Antibiotica (Prof T Korzybski und Prof W Kurylowicz), *review* by Dr B K Kelly, 589
Antibiotics Use of, to purify Blue-Green Algae (Blue-Green Algae), (Dr Y T Tchan and J Gould), 1276
Antibodies (Antigens and) A 'Microspot' Test for (Dr Joseph G Feinberg), 985
Antibiotics and Newer Synthetic Drugs (Bradford Chemical Society, the Department of Chemical Technology of the Bradford Institute of Technology, and the Yorkshire Council for Further Education Symposium on), 1132
Antibodies (Circulating), in the Milk of the Rat Selective Secretion of (E Ruth I Biswas), 883
Antibodies (Complement-fixing), to Human Growth Hormone and Sheep Interstitial Cell Stimulating Hormone (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Antibodies (Fluorescent) Rapid Preparation of, using Gel-Filtration (Johan Killander, Jan Ponten and Lennart Roden), 182
Antibodies (Lytic) Mast Cell (Dr I Mota), 1201
Antibodies (Precipitating), in the Carpet Snake against Parasitic Nematodes (H Timourian, C Dobson and J F A Sprent), 996
Antibody Attachment of, to Influenza Virus (Dr K J Lafferty and S J Oertelis), 764
Antibody in β_2-Globulins of Mouse Serum and Ascitic Fluid Identification of (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
Antibody (Intraventricularly Injected Anti-N Caudatus) Effects of, on the Electrical Activity of the Cat Brain (Dr Lj Mihailović and Dr B D Jankovic), 665
Antibody Production in an *in vitro* System Importance of Cell Division for (R W Dutton), 462
Antibody (Antigen–) Precipitation contrasted in Gels of High and Physiological Salt Concentrations (Dr Alfred J Crowle and David C Lueker), 50
Antibody (Homologous) Esterase in Extracellular Concentrates of Group A Streptococci and the (Extracellular Esterase of Group A Streptococci), (Aaron H Stock, José Uriel and Pierre Grabar), 434

INDEX

Antibody (A Precipitating), to Insulin (Valerie E Jones and Prof A C Cunliffe), 136
Anticoagulants Human, Cow and Rabbit Native Fibrin Powders as (Dr A L Copley and Beverly Becher), 568
Antidiuretic Hormone and Renal Collecting Tubules (Paul Breddy, Grahame F Cooper and Dr Jeffrey M N Boss), 76
Antidote to 8-Hydroxyquinoline and Alloxan D-Penicillamine as an (Makoto Matsuda and Prof Katashi Makino), 261
Antiferromagnetism in $LaCrO_3$ Electron Paramagnetic Resonance and (L Weinberg and P Larssen), 445
Antifouling Properties A Coating with, from the Reaction between Cuprous Oxide and Sodium Silicate (J R Rischbieth and F Marson), 748
Antifungal Antibiotic (New), of Potential Use in Agriculture Venturicidin, a (A Rhodes, K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
B Antigen in Man Quantitative Sub-Groups of the, and their Occurrence in Three Racial Groups (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Antigen (P_1) in the Human Foetus (Elizabeth Ikin, Dr H E M Kay, J H L Playfair and Dr A E Mourant), 883
Antigen–Antibody Precipitation contrasted in Gels of High and Physiological Salt Concentrations (Dr Alfred J Crowle and David C Lueker), 50
Antigenic Structure of *Entamoeba histolytica* (A Sen, S N Ghosh, S Mukerjee and J C Ray), 893
Antigenicity of Guinea Pig Testicular Cells grown in Cell Culture as determined by the Isolated Ileum Technique (Dr Seymour Katsh and Dr Russell T Jordan), 770
Antigenicity of Penicillin and its relation to Albumin Binding (Dr Toshio Torii and Dr Yoshihi Kohoriuchi), 429
Antigens (Closely Related), in Human Placenta and Kidney (Dr Raymond William Steblay), 1259
Antigens (Specific), of Human Leucocytes and Thrombocytes (Nechama Gilboa-Garber and Dr A Nelken), 466
Antigens and Antibodies A 'Microspot' Test for (Dr Joseph G Feinberg), 985
Anti-Haemolysin Titre (High), in Rabbits New Method of preparing *Corynebacterium pyogenes* Toxoid with (Valerie Levy), 189
Anti-Hypertensive Properties A Non-diuretic Benzothiadiazine with (Dr Alan A Rubin, Franklin E Roth and Martin M Winbury), 176, *erratum*, 802
Anti-N Caudatus Antibody (Intraventricularly Injected) Effects of, on the Electrical Activity of the Cat Brain (Dr Lj Mihailovic and Dr B D Janković), 665
Antioxidant (A Novel Type of), related to Polyporic Acid (Dr G J Bennett and Dr N Uri), 354
Antioxidants Protection by, against Lethal Doses of Carbon Tetrachloride (Dr C H Gallagher), 881
Antiserum (Organ-Specific) Apparent Induction of Malignant Tumours by (Prof H N Green), 1201
Antithrombin Activity of Normal and Pathological Cerebrospinal Fluid (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Anti-Toxin A Subcellular Component of *Corynebacterium diphtheriae* having the Capacity to Bind (Prof M Yoneda and M Matsuda), 642
Aortic Embolism Syndrome (Acute), in Cats Production of Aortic Occlusion resembling (Roy K Imhoff), 979
Aortic Occlusion resembling Acute Aortic Embolism Syndrome in Cats Production of (Roy K Imhoff), 979
Aphrodes bicinctus (Schrank) in North America Transmission of Clover Phyllody Virus by (Dr L N Chiykowski), 581
Apical Meristems (Dr F A L Clowes), *review* by Dr A Allsopp, 830
Apoprotein Derivatives Structure and Properties of the Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and (Prof R K Morton), 727
Apothecaries of London (Faculty of History of the Worshipful Society of), in co operation with the Chemical Society Second British Congress on the History of Medicine and Pharmacy—Chemistry in the Service of Medicine, 1017
Apparatus for Observations on the Feeding Mechanism of the Flea (M M J Lavoipierre and M Hamachi), 998
Apparent Induction of Malignant Tumours by Organ-Specific Antiserum (Prof H N Green), 1201
Appendix (Rabbit) Morphological Changes following Transplantation and Chronic Obstruction of the (J A Williams, W O Griffen, jun, and A Sharma), 877
Applebaum, S W (Harpaz, Dr I, and) Accumulation of Asparagine in Maize Plants infected by Maize Rough Dwarf Virus and its Significance in Plant Virology, 780
Apples (Seedling) Rootstock Influence on the Flowering of (H M Tydeman), 83
Application of Atomic Absorption Spectroscopy to the Determination of Calcium in Saliva (Ernest Newbrun), 1182
Application to Non-Newtonian Measurements Rotation Viscometers and their (Dr R McKennell), 308
Application of Palaeomagnetism to Geological Correlation (A Larochelle), 37
Application of Palaeomagnetism to Thrust Mechanics (D K Norris and R F Black), 933
Application (Industrial) Radiation—Use and Control in (Dr Charles Wesley Shilling), *review* by B E Jones, 855
Application (A New), of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient Magnetic Fields (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Applications Atomic Energy and its (*Atoomenergie en haar Toepassingen*), Vol 3, No 6 (Reactor Centrum Nederland), 19
  Function Theory and its, *review* by Prof W K Hayman, 694
Applications of Science to Peaceful Uses, *review* by R Brightman, 850
Applications (Chemical), of Diffraction Methods (Bradford Institute of Technology Course on), 21
Applied Geography (Prof Robert W Steel), 715
Applied Science (Pure and) International Co-operation in (Seventh Pugwash Conference on Science and World Affairs), 1232
Approaches (Fundamental and Practical), to Ageing Protection (Natural Rubber Producers' Research Association Symposium on), 115
Apps, Dr R L Appointed lecturer in the Department of Materials, College of Aeronautics, Cranfield, 406
Aquatic Mymarid Diapause in an (D J Jackson), 823
Aqueous Cystine Solutions Products of the γ-Radiolysis of (Dr D W Grant, S N Mason and M A Link), 352
Aqueous Solutions of Ascorbic Acid Rubeanic Acid as Stabilizer of (Aleksandra Smoczkiewiczowa and Janina Grochmalicka), 161
Arai, Ken-ichi, and Saito, Tsuneyuki Changes in Adenine Nucleotides in the Muscles of some Marine Invertebrates, 451
Arachnological Anthology An, *review* by Dr E Duffey, 829
Araya, S, and others Soluble Collagen in Bone, 758
Arcamone, F, and others Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall, 552
Archegoniate Plants (Lower) Growth and Development of the (Linnean Society of London International Symposium on), 710
Archipelago (Seychelles) Potassium–Argon Age Determinations on Granite from the Island of Mahe in the (J A Miller and J D Mudie), 1174
Argininosuccinic Acid Determination of, by Ion-Exchange Chromatography (D C Cusworth and R G Westall), 555
Argon, Dr A S, and Orowan, Prof E Lattice Rotation at Slip Band Intersections, 447
Argon (Potassium–) Ages at Broken Hill, Australia (Dr J F Evernden and Dr J R Richards), 446
Argument (Complex) Table of Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$$

for (V N Faddeyeva and N M Terent'ev), edited by V A Fok (translated from the Russian by D G Fry), *review* by Prof C A Coulson, 97
Arid Regions A History of Land Use in (edited by Prof L Dudley Stamp), (Unesco, Arid Zone Research No 17), 1236
Ariophanta sp Effect of Ribonuclease on Shell Regeneration in (K K Nair and P T Muthe), 674
Armstrong, F A J, and Boalch, G T Ultra-violet Absorption of Sea Water, 858
Armstrong, Dr V Appointed chairman of the Commonwealth Agricultural Bureaux, 507
Armstrong, Dr W McD Distribution of Potassium in Baker's Yeast, 65
Army Worm Control of the, on Grazing in Kenya (J A Bullock and D C Bond), 480
Arnold, Prof A H M Inductance Coils, *review*, 845
Arnold, D C Possible Origin of the Use of Fire by Early Man, 1318
Arnold, G W Diet of Sheep, 113
Arnold, R M Appointed deputy head of the Wellcome Veterinary Research Station, 922
Arnott, D G, and others Progress of Cancer Research, 1251
Aromatic Hydrocarbons in Fluid Media Evidence for the Photo-Association of (Dr B Stevens), 725
Aromatic Hydroxylation *In vivo* and *in vitro* Inhibition of, by Riboflavin (K H Harper and Dr G Calcutt), 165
Aron, C P Microwave Measurement Techniques (Apparatus for the Measurement of the Tensor Susceptibility of Ferrite Materials), 410
Aronson, Dr Moshe, and Elberg, Dr Sanford S Detection of Inclusion Bodies containing Deoxyribonucleic Acid by means of Autoradiography, 981
Arrays Optical Calibration of some Monodisperse Polystyrene Latexes in (Dr Herbert E Kubitschek), 1148
Arrest of Acceleration of Speech evoked by Thalamic Stimulation in the Course of Stereotaxic Procedures for Parkinsonism (Dr G Guiot, and collaborators), 921
Arrow, Prof Kenneth J Elected to an Extraordinary Fellowship at Churchill College, Cambridge, 710
Arsenic Content of Napoleon I's Hair probably taken immediately after his Death (Dr Sten Forshufvud, Dr Hamilton Smith and Dr Anders Wassén), 103
Arsenide (Gallium) Energy-Level Model for High-Resistivity (J Blanc and L R Weisberg), 155
Arterial Tissue of the Rabbit Transaminase Activity in (Dhurjati Prasad Chattopadhyay), 660
Arteries (Extracranial Cerebral) Cerebral Infarction—the Role of Stenosis of the (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Arteries (Large), of Chick Embryos Dissecting Aneurisms of the, due to (Sweet Pea) Lathyrism (Z Zahoř and M Machova), 532
Arteriolar Nerves in the Guinea Pig Pancreas Fine Structure of the (Dr J D Lever and Dr A C Esterhuizen), 566
Arteriosclerosis Re-Evaluation of some Factors in (Dr Hans Kaunitz), 9
Arthropod Parasites of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol I, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
Artificial Computer Languages (British Association for the Advancement of Science, Section A* (Mathematics), Symposium on), 22
Artificial Earth Satellites (British Astronomical Association), 802
Artificial Satellites of Earth Errors in Orbital Predictions for (Kenneth Moe), 151
Arts (Czechoslovak Science and) Contributions of, to World Culture (Czechoslovak Society of Arts and Sciences in America Symposium on), 309
Arts and Sciences, American Academy of Records of the Academy (1960-61), 515
Arts and Sciences in America (Czechoslovak Society of) Symposium on the Contributions of Czechoslovak Science and Arts to World Culture, 309
Arylesterase Sex Hormones as a Possible Factor controlling Biosynthesis of (Dr Klas-Bertil Augustinsson and Bertil Olsson), 969
Asana, Prof R D *Obituary* of Prof R H Dastur, 1128
Asana, Prof R D, and others Cotton in India, Vol 2, *review* by Prof S C Harland, 200
Asarone and β-Asarone Pharmacodynamical Effects of (J D Sharma, Dr P C Dandiya, Dr R M Baxter and Dr S I Kandel), 1299

INDEX

β-Asarone (Asarone and) Pharmacodynamical Effects of (J D Sharma, Dr P C Dandiya, Dr R M Baxter and Dr S I Kandel), 1299
Ascaris lumbricoides (Nematode) Localization of Esterase in the Cuticle of the (Dr D L Lee), 282
Aschaffenburg, Dr R Inherited Casein Variants in Cow's Milk, 431
Ascites Carcinoma (Ehrlich), in Mice Action of Deoxyribonuclease and Ribonuclease on the Growth of (Dr Gaston de Lamirande), 52
Ascites Tumour Cells Acylase Activity of, on Dichloroacetyl Derivatives of Amino-Acids (Yukio Kameda, Katsuhiko Matsui, Yukio Kumura and Etsuko Toyoura), 468
  Intracellular Response to an Iso-immune Reaction at the Surface of (D C Dumonde, Clarice G Walter, Lucille Bitansky, Prof G J Cunningham and J Chayen), 1302
Ascites Tumours Types of Cell in (Dr John O Laws), 78
Ascitic Fluid Identification of Antibody in β_2-Globulins of Mouse Serum and (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
Ascorbic Acid Rubeanic Acid as Stabilizer of Aqueous Solutions of (Aleksandra Smoczkiewiczowa and Janina Grochmalicka), 161
LAscorbic Acid Biosynthesis of—Missing Steps in Animals incapable of Synthesizing the Vitamin (I B Chatterjee, N C Kar, N C Ghosh and Prof B C Guha), 163
Ascorbic Acid (Dietary) Effect of, on the Silkworm, *Bombyx mori* (Dr Toshio Ito), 951
Ashby, Prof W Ross Neuro-Psychopharmacology, *review*, 392
Ashida, Joji (Yoda, Shizuko, and) Effect of Auxin on the Osmotic Value in Pea Stem Sections, 577
Ashmore, Dr P G The Study of Fast Reactions (Chain Reactions in Gases, especially those leading to the Ignition of Gases), 1136
Asiatic Russia Some Aspects of, *review* by Prof S I Tomkeieff, 200
  Physical Geography of (S P Suslov), translated from the Russian by Noah D Gershevsky , edited by Joseph E Williams, *review* by Prof S I Tomkeieff, 200
Asparagine Accumulation of, in Maize Plants infected by Maize Rough Dwarf Virus and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
Asparagine Monohydrate Structure of (G Kartha and A de Vries), 862
Aspects of Asiatic Russia Some, *review* by Prof S I Tomkeieff, 200
Aspects of the Dynamic Organic Matter Cycle in Soils (Welsh Soils Discussion Group Discussion on), 309
Aspects (Biochemical), of Phagocytosis (Dr G Y N Iyer, Dr M F Islam and Prof J H Quastel), 535
Aspects (Quantitative), of the Re-Utilization of Protein-bound Amino-acids *in vivo* (Dr H Walter and H Zipper), 1292
Associated Liquids Lattice-like Vibrations in, and the Origin of Anomalous Rayleigh Scattering (J K Wilmshurst), 1061
Association (Photo-) of Aromatic Hydrocarbons in Fluid Media Evidence for the (Dr B Stevens), 725
Astarabadi, Dr T Failure of the Purified Growth Hormone to restore the Size of the Kidneys in Hypophysectomized Rats, 270
Asthmatic (Anti-) Effect of Phenazone and Amidopyrine (H Herxheimer and E Stresemann), 1089
Astronautical Congress Twelfth International (Dr W F Hilton), 1244
Astronautics (N A T O Advisory Group for Aeronautical Research and Development, and the University of Southampton Seminar on), 310
Astronautik Handbuch der (herausgegeben von Prof Karl Schutte und Hans K Kaiser), Band I, Lieferungen 1-6, *review* by D G King-Hele, 102
Astronomical Association (British) Artificial Earth Satellites, 802
Astronomical Society (Royal), and the Geological Society Geophysical Discussion on the Interpretation of Geophysical Surveys, 1242
Astronomical and Nautical Almanacs, 1240
Astronomy Survey of, *review* by Dr A Danjon, 838
  Vistas in (edited by Arthur Beer), Vol 3, Part I, Dynamics, Geophysics, Instruments, Solar System , Vol 3, Part 2, Stellar Astronomy, Stellar Evolution, Photometry, Galaxies, Spectroscopy, Cosmology, *review* by Dr A Danjon, 838
Astrup, Harald Hormonal Control of Oxidized Flavour in Milk, 559
Asundi, Prof R K , and others Rotational Analysis of ^{45}Cu^{35}Cl Bands, 444
Asymmetry (Outer Atmospheric) Confirmation of, postulated to explain the False Zodiacal Light (E R Hope), 742
Asymptotic Solutions of Differential Equations of the Second Order Tables of Airy Functions and Special Confluent Hypergeometric Functions for (D G Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Atassi, Dr M Z , and others Some Tetrahydropyranyl Derivatives of Glycine, Serine and Urea, 1069
  Mucoproteins of Bronchial Mucus, 1269
Atheroma (Experimental), in Budgerigars (Dr R Finlayson and V Hirchinson), 369
Atherosclerosis (Avian) Requirement of Essential Fatty Acids and (H Fisher, A S Feigenbaum and H S Weiss), 1310
Atherton, A J , and others Nuclear Spin of Protoactinium-231 from Hyperfine Splitting, 444
Atkinson, Dr M R , and others Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth, 946
Atkinson, R J Promoted to Deputy Chief Scientific Officer, and head of the Structures Department of the Royal Aircraft Establishment, 306 , work of, 306
Atlantic Natural Glass from beneath Red Clay on the Floor of the (Dr G D Nicholls and V T Bowen), 156
Atlantic (Tropical) Trawl Fishing in the—Catch-rates and Composition (R H Lowe (McConnell) and Alan R Longhurst), 620, Preliminary Bionomic Data from West African Fisheries (Alan R Longhurst), 621
Atlas Moon (V A Firsoff), *review* by Brian Warner, 1111
Atlas of Galaxies The Hubble (Dr Allan Sandage), *review* by Prof R O Redman, 838
Atlas of the Other Side of the Moon (edited by N P Barabashov, A A Mikhailov and Yu N Lipskiy) translated into English by Leon Ter-Oganian, *review* by Prof Zdenek Kopal, 839
Atlas Computer Laboratory of the National Institute for Research in Nuclear Science Appointment of Dr J Howlett as head of the, 918
Atlas (Welt-) Klimadiagramm- (Prof Heinrich Walter und Dr Helmut Lieth), Lief I, *review* by Prof G Manley, 5
Atmosphere Medium Range Diffusion in the (Royal Meteorological Society Symposium on), 13
  Movement in the (R J Murgatroyd), 12
Atmosphere (Planetary), with Rayleigh Scattering Tables related to Radiation emerging from a (Kinsell L Coulson, Jitendra V Dave and Zdenek Sekera), *review* by Prof Zdenek Kopal, 1005
Atmosphere (Upper) Winds and Circulation in the (Royal Meteorological Society Symposium on), 12
  A Working Model for the (Luigi G Jacchia), 1147
Atmospheric Asymmetry (Outer) Confirmation of, postulated to explain the False Zodiacal Light (E R Hope), 742
Atmospheric Diffusion Experiments Loss of Fluorescent Particles in, by Comparison with Radioxenon Tracer (A E J Eggleton and N Thompson), 935
Atmospheric Hydrogen and Methane Isotopic Composition of (A E Bainbridge, Prof H E Suess and Irving Friedman), 648 , (K F Bishop, R T Taylor and A E J Eggleton), 649
Atmospheric Methane, Hydrogen and Stratospheric Water Origin of High Tritium Content of (Dr Richard Wolfgang), 1279
Atmospheric Photochemical Products ('Smog') Interaction of Light and, within Plants (O C Taylor, W M Dugger, jun , E A Cardiff and E F Darley), 814
Atmospheric Photochemistry (Sir Harrie Massey and Dr A E Potter), 213
Atmospheric Scale Height as a Modifying Influence on Linear Trend of *F*-Region Electron Density with Sunspot Number (Jean M Bullen), 542
Atmospheric and Terrestrial Physics, Journal of Special Supplement No 7, Vistas in Astronomy (edited by Arthur Beer), Vol 3, Part I, Dynamics, Geophysics, Instruments, Solar System , Vol 3, Part 2, Stellar Astronomy, Stellar Evolution, Photometry, Galaxies, Spectroscopy, Cosmology, *review* by Dr A Danjon, 838
Atomic Absorption Spectroscopy Application of, to the Determination of Calcium in Saliva (Ernest Newbrun), 1182
Atomic Energy and its Applications (*Atoomenergie en haar Toepassingen*), Vol 3, No 6 (Reactor Centrum Nederland), 19
Atomic Energy of Canada, Ltd Proceedings of the Sixth Tripartite Instrumentation Conference (1959), Part I, Reactor Instruments , Part 2, Radiation Dosimetry , Part 3, System and Component Reliability , Part 4, Instruments for Nuclear Physics , Part 5, Radiation Detectors, 802
Atomic Energy Agency (International) Election of Oscar A Quihillalt as president, 21
  Appointment of Dr Sigvard Eklund as director-general, 115
  Conference on New Techniques in Biology and Medicine, 609
Atomic Energy Agency (International), and others International Seminar for Research and Education in Physics, 709
Atomic Energy Authority (United Kingdom) Promotion of J C Martin (of the Atomic Weapons Research Establishment, Aldermaston) to Senior Principal Scientific Officer, 215
  Promotion of Dr J B Taylor (of the Atomic Weapons Research Establishment, Aldermaston), to Senior Principal Scientific Officer, 215
  Resignation of J B W Cunningham as managing director of the Engineering Group, 505
  Appointment of H V Disney as managing director of the Engineering Group, 505
Atomic Energy Commission (Australian) Eighth Annual Report (1959-60), 931
Atomic Energy Commission Research Establishment (Danish) Report No 18, Plasma Physics, 1025
Atomic Energy Institute (Norwegian) Inauguration of *Nora*, a New Zero Power Reactor, 918
Atomic Energy Waste, its Nature, Use and Disposal (edited by E Glueckauf), *review* by A W Kenny, 846
Atomic Hydrogen Excitation of the *2s* State of, by Electron Impact (Dr B L Moiseiwitsch), 545
Atomic Nucleus Jubilee of the 505
Atoomenergie en haar Toepassingen (Atomic Energy and its Applications), Vol 3, No 6 (Reactor Centrum Nederland), 19
Attachment of Antibody to Influenza Virus (Dr K J Lafferty and S J Oertelis), 764
Attention and In-Attention in Neurophysiology (L Goldie and J M Green), 1116
Auclair, Dr Walter Cultivation of Monolayer Cultures of Frog Renal Cells, 467
Auger, Prof Pierre Current Trends in Scientific Research, *review* by R Brightman, 850
Augustinsson, Dr Klas-Bertil, and Olsson, Bertil Sex Hormones as a Possible Factor controlling Biosynthesis of Arylesterase, 969
Auroral Arcs (Quiet) A Morning Discontinuity in the Orientation of (Bengt Hultqvist Alv Egeland and Georg Gustafsson), 956
Auroral Frequency (High-Altitude) Diurnal Variation of, on Magnetically Quiet and Disturbed Days (Knut Lassen), 345
Aust, J Bradley (Guttmann, Ronald D , and) Acquired Tolerance to Homografts produced by Homologous Spleen Cell Injection in Adult Mice, 564
Austin, Sue, and others Seasonal Variation in Alginic Acid, Mannitol, Laminarin and Fucoidin in the Brown Alga, *Ecklonia radiata*, 1208
Australia Dairy Research in, 1131
  Electrotechnology in, 608
  Potassium–Argon Ages at Broken Hill (Dr J F Evernden and Dr J R Richards), 446
  Scientific Research in, 307
Australia (Commonwealth of) Scientific and Industrial Research Organization Rural Research in the C S I R O , No 36, Diet of Sheep (G W Arnold) 113
  Research Review for 1959-60, 307
  Annual Report of the Division of Electrotechnology, 608
  Division of Food Preservation—New Laboratories, 699
  Wool Research Colloquium No 1, Wool Structure, 709
  Thirteenth Annual Report (1960-61), 712
  Annual Report for 1960-61 of the Dairy Section, 1131
Australia (South) Occurrence of Magnesite–Dolomite Sediments in (Prof A R Alderman and C C von der Borch), 861
Australian Aborigines Absence of Red Cell Enzyme Deficiency in (Prof O Budtz-Olsen and Dr Chev Kidson), 765

Australian Academy of Science (Spectroscopy Committee) Third Australian Spectroscopy Conference, 927
Australian Atomic Energy Commission Eighth Annual Report (1959-60), 931
Australian Mathematical Society Election of Officers, 114
Australian Museum *Magazine*, Vol 13 No 11, 1024
Australian National Radio Astronomy Observatory, 1019
Australian Rice Soils Nitrogen-fixing Blue-Green Algae in (Dr J S Bunt), 479
Australian Spectroscopy Conference Third (Dr R A Durie), 927
Australian (South) Museum Report for 1959-60, 20
  Records of the, Vol 14, No 1, 921
Austwick, K Teaching Machines (An Educational Viewpoint), 106
Auto-Immunization and Liver Cirrhosis (Dr W Mori and Dr T Suzuta), 41
Auto-Ionizing Transitions in Krypton Experimental Detection of, by Electron Impact (John F Burns), 651
Automatic Data Processing (Derek Wragge Morley), 1024
Automation, Computers, Control and Measuring Elsevier's Dictionary of, in Six Languages, English/American, French, Spanish, Italian, Dutch and German (compiled and arranged on an English alphabetical base by W E Clason), *review* by S Whelan, 904
Automeris Effect of Pupal Brain Surgery on the Rocking Response of (Dr A D Blest), 373
Autonomic Nervous System and the Occurrence of Visceral Lesions (Hiroshi Itoh, Teizo Kasahara, Kazua Amano, Koh Okamoto and Samon Tanabe), 1025
Autoradiographic Study of Cell Migration during Histogenesis of Cerebral Cortex in the Mouse (Dr J B Angevine, jun, and R L Sidman), 766
Autoradiography Detection of Inclusion Bodies containing Deoxyribonucleic Acid by means of (Dr Moshe Aronson and Dr Sanford S Elberg), 981
Autoradiography using Melted Nuclear Emulsion (Dr A C Kulangara), 437
Auxin Effect of, on the Osmotic Value in Pea Stem Sections (Shizuko Yoda and Joji Ashida), 577
Auxin (Unknown), from a Solution of Indole-3-Acetic Acid labelled with Carbon-14 Isolation of an (Prof J H M Henderson), 1076
Auxin Activity in Ether-insoluble Fractions of Extracts of Rhubarb Petioles (B E S Gunning), 661
Auxin-bound Proteins Formation of (Archana Sen Gupta and S P Sen), 1290
Availability (Biological), of Methionine and Cystine Determination of (D Guttridge, Dr D Lewis and J T Morgan), 753
Avena fatua L Bioassay of Gibberellic Acid using Excised Embryos of (Prof J M Naylor and G M Simpson), 679
Avena Coleoptile Effect of Indole-3-Acetic Acid (IAA) on Phosphorus Metabolism in the (A Sen Gupta and S P Sen), 1291
Averill, W (Ettre, L S, and) Microchemical Techniques (New Gas Chromatographic Instrumentation using Capillary (Golay) Columns and Ultra-sensitive Detectors permit the Direct Analysis of Trace Components in Samples of Micro-size), 412
Avian Atherosclerosis Requirement of Essential Fatty Acids and (H Fisher, A S Feigenbaum and H S Weiss), 1310
Aviation, Ministry of Report of the Committee on the Planning of Helicopter Stations in the London Area 29
Aviation, Ministry of (Explosives Research and Development Establishment, Waltham Abbey) Promotion of Dr L J Bellamy to Deputy Chief Scientific Officer, 214
Awards (Gairdner Foundation), 309
Awards (Royal Institution of Naval Architects), 309
Axell, A W, and Wild, H (edited by) Flora Zambesiaca—Mozambique, Federation of Rhodesia and Nyasaland, Bechuanaland Protectorate, Vol 1, Part 2, *review* by E Milne-Redhead, 1220
Axelrod, J (Hertting, G, and) Fate of Tritiated Noradrenaline at the Sympathetic Nerve-Endings 172
Axenic Cultivation of an Enchytraeid Annelid (Dr Ellsworth C Dougherty and Bjorn Solberg), 184
Aykroyd, Dr W R Conquest of Hunger, 417
  World Food Problems, review, 1006
Aylward, Dr Francis The Better Use of the World's Fauna for Food, 1112
Azide (Lead) Kinetics of Reaction of the Decomposition of (Dr J Stammler, J E Abel and Dr R C Ling), 626
Azotobacter vinelandii Production of Slime Substance in Mixed Cultures of *Rhodopseudomonas capsulatus* and (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Azotobacter Cultures Detection of Gibberellic Acid in (V Vančura), 88
Azuma, T, and others Effects of Intensity of Driving Stimulus on the Shape of Membrane Action Potential of the Heart, 1295

BABBAGE (Charles) Award of the British Institution of Radio Engineers awarded to E M Bradley, 609
Babicky Dr Arnošt (Kolař, Dr Jaromír, and) Generalized Skeletal Response on Local Trauma in Young Rats studied by means of ^{45}Ca-Metabolism, 1297
Babylon Science since (Prof Derek J de Solla Price), *review* by Dr W P D Wightman, 825
Bach, I, and others Effect of Monovalent Cations on the Blood Pressure of Intact and Hypertensive Rats, 362
Bach-y-Rita, P, and others Effect of X-Irradiation on Self-Stimulation of the Brain 1309
Bacillus subtilis Comparison of Transduction versus Transformation of Linked Markers in (Erela Ephrati-Elizur and Maurice S Fox), 433
Backeberg, Dr Curt Wunderwelt Kakteen, *review* by Dr N L Bor, 1223
Backus, Richard H, and others Bioluminescence in the Surface Waters of the Sea, 518
Bacon, H R Oxidation Processes in Chemical Manufacture (Oxidation of Organic Compounds by Metal Ions and Complexes) 1136
Bacteria Mechanism of Streptomycin Action on—a Unitary Hypothesis (Dr Charles R Spotts and Prof R Y Stanier), 633
  Separation of, by Counter-Current Distribution (G David Baird, Per-Åke Albertsson and Bengt v Hofsten), 236
  Serum β-Globulin Types in Red Deer and other Species and their Stability in the Presence of (V P W Lowe and E I McDougall), 983
Bacteria (Marine) Solute Requirements for Preventing lysis of some (Prof Robert A MacLeod and Tibor Matula), 1209
  Spheroplasts of, induced by the Action of Penicillin (J R Boring and Prof D Pratt), 773
Bacteria (Purple) Biosynthesis of Carotenoids in—a Re-Evaluation based on Considerations of Chemical Structure (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Bacteria-free Cultures Isolation of, from Hormogone-producing Blue-Green Algae (Blue-Green Algae), (Dr J S Bunt), 1275
Bacterial Cell The, *review* by Dr S Dagley, 489
  Synthesis and Organization in the (Dr E F Gale), *review* by Dr S Dagley, 489
Bacterial Cells (Lyophilized), exposed to Oxygen Electron-Spin Resonance Signals from (Dr M B Lion, Dr J S Kirby-Smith and Dr M L Randolph), 34
Bacterial Endospore Dipicolinic Acid Content, Heat-Activation and the Concept of Dormancy in the (A Keynan, W G Murrell and Prof H O Halvorson), 1211
Bacterial Variation in Legume Symbiosis Temperature Characteristics of (Dr J S Pate), 637
Bacteriophage Effect of Phagocytosis on the Lysis of *Staphylococcus aureus* (Type 81) by (Dr J M McKenna and R P Sanderson), 570
T4rII Bacteriophage Reversion in, to r^+ induced by Ultra-Violet Irradiation Detecting (Prof C E Folsome and D Levin), 1306
Bailey, Prof W N *Obituary* by Prof H G Eggleston, 917
Bainbridge, A E, and others Isotopic Composition of Atmospheric Hydrogen and Methane, 648
Baird G David, and others Separation of Bacteria by Counter-Current Distribution, 236
Baker, A J Appointed Glaxo Fellow in chemistry in the University of Glasgow, 1132
Baker, Herman, and others Factor converting Mesophilic into Thermophilic Micro-organisms, 86

Bijl, Dr D (Firth, I M, and) Detection of Spin Magnetization Variation in a Two-level Maser Oscillator, 860
Bilbey, D L J, and others Response of the Reticulo-Endothelial System to Stimulation with Œstrogens, 978
Biliary Conjugates of 3,4-Benzpyrene Enzymatic Hydrolysis of, on Filter Paper (Dr Hans L Falk, Sung Suk Lee and Prof Paul Kotin), 973
Bilirubin Enterohepatic Circulation of (Roger Lester, J Donald Ostrow and Prof Rudi Schmid), 372
Bilirubin (Conjugated) Electrophoretic Separation of, on Paper (Dr E Talafant), 972
Billig, Prof Kurt Structural Concrete, *review* by Prof A W Hendry, 7
Billington, R Appointed inspector of wireless telegraphy in the Wireless Telegraph Section of the Radio Services Department of the Post Office, 1129, work of, 1129
Binary Compounds A Quantitative Theory of the Character of Chemical Bonding in (Prof Edward Gorlich), 133
Binding of *RP2-L*—a Nuclear Protein of Neoplastic Tissues—to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870
Binding (Albumin) Antigenicity of Penicillin and its relation to (Dr Toshio Torii and Dr Yoshihi Kohoriuchi), 429
Binding (Haemin–Protein), in Peroxidase and Methaemalbumin (Dr A C Maehly), 630
Binding (Paramagnetic Ion), in Deoxyribonucleic Acid Solutions Relaxation Enhancement by (J Eisinger, R G Sulman and W E Blumberg), 963
Binette, J P, and Schmid, K Resolution of Pathological Human Gamma-Globulins by Starch-Gel Electrophoresis, 732
Bingham Medal for 1960 of the Society of Rheology awarded to Dr B H Zimm, 1008
Binks, Dr R Appointed lecturer in organic chemistry at the University of Bristol, 710
Bioassay of Gibberellic Acid using Excised Embryos of *Avena fatua* L (Prof J M Naylor and G M Simpson), 679
Biochanin A (Plant Œstrogen), in the Rat Demethylation of the (Anna Nilsson), 358
Biochemical Aspects of Phagocytosis (Dr G Y N Iyer, Dr M F Islam and Prof J H Quastel), 535
Biochemical Engineering (Institution of Chemical Engineers Symposium on), 119
Biochemical Journal Change of Address, 309
Biochemical Society 410th Meeting, 309
  Change of Address, 309
Biochemical Society and the British Biophysical Society Joint Discussion on Phospholipids and Sulpholipids, 807
Biochemical Society (U S S R) Fifth International Congress of Biochemistry, 1115
Biochemistry Advances in Enzymology and related Subjects of (edited by F F Nord), Vol 22, *review* by Dr E C Webb, 854
  Fifth International Congress of (U S S R Biochemical Society), 1115
Biochemistry of Plant Phenolic Substances (Plant Phenolics Group of North America Symposium on) 418
Biochemistry (Microbial), Ciba Lectures in (1959) Synthesis and Organisation in the Bacterial Cell (Dr E F Gale), *review* by Dr S Dagley, 489
Biochemists (Clinical), Association of Election of Officers, 309
Biological Activity of a Soluble Ribonucleic Acid Conservation of the (J H Weil, Prof J P Ebel and R Monier), 169
Biological Availability of Methionine and Cystine Determination of (D Guttridge, Dr D Lewis and J T Morgan), 753
Biological Education in American Secondary Schools, 1890-1960 (Dr Paul De Hart Hurd), *review*, 1007
Biological Engineering Society Election of Officers, 507
Biological Half-Life (Prolonged), of Sodium-22 in Patients with Essential Hypertension (Dr Lewis K Dahl, Malcolm G Smilay, Lawrence Silver and Sanford C Spraragen), 267
Biological Origin Some Physico-Chemical Properties of Paracrystalline Spherulites of (Dr G T Stewart), 624
Biological Samples Estimation of Mass Thickness of, from their Electron Micrographs (M L De), 546
Biological Sciences, American Institute of Biological Sciences Curriculum Study Bulletin No 1, Biological Education in American Secondary Schools, 1890-1960 (Dr Paul De Hart Hurd), *review*, 1007
Biological Species confused under the Name *Culicoides austeni* (Carter, Ingram and McFie), (D H Murphy), 186
Biological Spectrum of some New Tuberculostatic 1,3,4-Oxadiazolones with special reference to Cross-Resistance and Rates of Emergence of Resistance (Prof A E Wilder Smith and Hans Brodhage), 1195
Biological and Medical Microscopy Scanning Techniques in (New York Academy of Sciences Conference on), 1030
Biologically Active Materials in Coal (Martin H Rogoff and Irvine Wender), 378
Biology in Britain (Prof H E Street), 416, (Dr H V Wyatt), 417
Biology Quantitative (Informal Symposium on, at the Dominion Physical Laboratory, New Zealand), 25
  Quantitative, *review* by Sir Hans Krebs, 591
Biology, Institute of Symposium on the Better Use of the World's Fauna for Food, 21, 1112
Biology, Institute of (Parasitology Group) Autumn Meeting (Parasites of World Importance), 21
Biology (Molecular), and Population Structure (British Association for the Advancement of Science, Section D (Zoology) and Section K (Botany), Joint Symposium on), 414
Biology (Submolecular) Introduction to a (Prof Albert Szent-Gyorgyi), *review* by Prof D D Eley 853
Biology and Medicine New Techniques in (International Atomic Energy Agency Conference on), 609
Bioluminescence in the Surface Waters of the Sea (Richard H Backus, Charles S Yentsch and Asa Wing), 518
Bionomic Data (Preliminary), from West African Fisheries (Trawl Fishing in the Tropical Atlantic), (Alan R Longhurst), 621
Biophysical Society, British (Biochemical Society and the) Joint Discussion on Phospholipids and Sulpholipids, 807
Biosynthesis of Arylesterase Sex Hormones as a Possible Factor controlling (Dr Klas-Bertil Augustinsson and Bertil Olsson), 969
Biosynthesis of L-Ascorbic Acid—Missing Steps in Animals incapable of Synthesizing the Vitamin (I B Chatterjee, N C Kar, N C Ghosh and Prof B C Guha), 163
Biosynthesis of Carotenoids in Purple Bacteria—a Re-Evaluation based on Considerations of Chemical Structure (Synnove Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Biosynthesis of Gossypol by Excised Cotton Roots (Prof F H Smith), 888
Biosynthesis of Porphyrins and Chlorophylls (Dr K D Gibson, Margaret Matthew, Prof A Neuberger and G H Tait), 204
Biosynthesis (Ribonucleic Acid) Manner of expressing Rate of (D G Fraenkel and F C Neidhardt), 677
Biotin, a Growth Requirement for Four Soil Amoebae (R N Band), 674
Bipyramidal (The Trigonal-) Configuration of the Iodo *Bis*(2-2′-Bipyridyl) Copper (II) Ion (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard), 425
2,2′-Bipyridyl Five-Covalent Copper (II) Complexes containing 1,10-Phenanthroline and (Properties of some Copper Complexes), (Dr C M Harris, T N Lockyer and Hanneke Waterman), 424
Bis(2-2′-Bipyridyl) Copper (II) Ion (Iodo) The Trigonal-Bipyramidal Configuration of the (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard), 425
Biraghi, Prof A At the Thirteenth Congress of the International Union of Forest Research Organizations (Forest Protection), 614
Birch, W L Microwave Measurement Techniques (Milliwattmeter capable of Detecting Changes of Power $\sim 10\mu W$ for the 70-80 Gc /s Band), 410
Bird, R G Appointed lecturer in civil engineering at the University of Birmingham, 406
Birds of Trinidad and Tobago (Dr G A C Herklots), *review* by Dr L B Quesnel, 828
Birds of Tropical Paradise, *review* by Dr L B Quesnel, 828
Birkett, L Mathematical Theory of Nutritional Relationships of Fishes, *review*, 297

Birks, Dr J B , and Hart, Prof J (edited by) Progress in Dielectrics, Vol 3, review by V Daniel, 203
Bishop, Sir Harold Twenty-five Years of B B C Television (B B C Monograph No 39), 1240
Bishop, K F, and others Isotopic Composition of Atmospheric Hydrogen and Methane 649
Bishop, P M , and Whittingham, Prof C P Gibberellic Acid and Chlorophyll Content of Leaves of Meteor Peas, 576
Bishop, P M (Whittingham, Prof C P , and) Thermal Reaction between Two Light Reactions in Photosynthesis, 426
Bishop, Prof P O , and others Probability Distribution Analyser programmed for Neurophysiological Research, 629
Bishop, Prof R E D , and Johnson, Prof D C The Mechanics of Vibration, *review* by Prof W A Tuplin, 844
Bishop Museum (Bernice P), Honolulu Herbert E Gregory Medal awarded to Prof A P Elkin, 21
  Report for 1960 (Work Half Done), 213
Bismuth (Radioactive) Isolation of, from Metallic Lead and its Compounds (J R W Kerr, Dr D I Coomber and Dr D T Lewis), 546
Biswas, E Ruth I Selective Secretion of Circulating Antibodies in the Milk of the Rat, 883
Bitensky, Lucille, and others Intracellular Response to an Iso-immune Reaction at the Surface of Ascites Tumour Cells, 1302
Bituminous Coals Carbonyl Content of the Vitrain Component of (Dr K Littlewood and M T Monaghan), 128
Bjerknes, J Changes of Climate (Theories of Changes of Climate), 1139
Black, R F (Norris, D K , and) Application of Palaeomagnetism to Thrust Mechanics, 933
Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl Probable Mechanism of Resistance of Varieties of Cocoa to (Dr John A Spence), 278
Blair, Alberta, and others Paradoxical Effect of Phlorizin on Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro*, 1085
Blair, Dr G W Scott Transactions of the Society of Rheology, *review*, 1008
Blair, Dr J A Conversion of 2-^{14}C-Pteroyl-L-Monoglutamic Acid into Isoxanthopterin in *Drosophila melanogaster*, 757
Blake, C D Importance of Osmotic Potential as a Component of the Total Potential of the Soil Water on the Movement of Nematodes, 144
Blakebrough, Dr N Biochemical Engineering, 120
Blanc, J , and Weisberg, L R Energy-Level Model for High-Resistivity Gallium Arsenide, 155
Blest, Dr A D Effect of Pupal Brain Surgery on the Rocking Response of *Automeris*, 373
Blin-Stoyle, Dr R J Appointed to the chair of theoretical physics in the University of Sussex, 504 , work of, 504
Blocking Agent against 5-Hydroxytryptamine 5-Hydroxy-3-indoleacetamidine—a New Type of (Dr Laszlo Gyermek), 465
Blood Flow of, in the Forearm of Persons acclimatized to Heat (Dr G C Whittow), 759
Blood and other Body Fluids (Analysis and compilation by Philip L Altman , edited by Dorothy S Dittmer), *review* by Sir Hans Krebs, 591
Blood and Serum Groups in Reindeer compared with those in Cattle (Bo Gahne and Jan Rendel), 529
Blood and Tissues Exchange of Substances between the (Sir Howard Florey), 908
Blood (Peripheral) Chromosome Preparations obtained directly from (M A Kinlough and Prof H N Robson), 684
Blood Cell (Human Red) Metabolism of the (Dr D Mendelsohn), 619
Blood Cell (Red) Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep Relationships between (Prof J V Evans), 567
Blood Cells (Red) Agglutination and the Electrical Surface Potential of (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Blood Cells (Sheep Red) Utilization of, in the Haemadsorption Test for Myxoviruses (H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with Liver Glycogen Disease (Von Gierke's Disease), (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265 , (Dr David Yi-Yung Hsia), 266
Blood Plasma A Micromethod for the Determination of Bradykininogen in (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Blood Platelets (Human) Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of (A Gaarder, Dr J Jonsen Prof S Laland, Dr A Hellem and Prof P A Owren), 531
Blood Pressure of Intact and Hypertensive Rats Effect of Monovalent Cations on the (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Blood Volume in the Pre-Hibernating and Deep-Hibernating Hedgehog Changes of (Dr Einar Eliassen), 1047
Bloom, Dr H J G , and Dawson, K B Enhanced Effect of Total-Body X-Irradiation in Mice under Mild Hypothermia, 232
Bloor, Kenneth 'Opinions of the Late and Best Phisitians', *review*, 848
Blount, Dr W P Nutrition and Poultry (Use of Birds as Experimental Animals), 615
Blue Sky Theory and Tables of the, *review* by Prof Zdenek Kopal, 1005
Blue-Green Algae—Growth (Dr J S Bunt), 1274 , Isolation of Bacteria-free Cultures from Hormogone-producing Blue-Green Algae (Dr J S Bunt), 1275 , Use of Antibiotics to purify Blue-Green Algae (Dr Y T Tchan and J Gould), 1276
  Use of Antibiotics to purify (Blue-Green Algae), (Dr Y T Tchan and J Gould), 1276
Blue-Green Algae (Hormogone-producing) Isolation of Bacteria-free Cultures from (Blue-Green Algae), (Dr J S Bunt), 1275
Blue-Green Algae (Nitrogen-fixing), in Australian Rice Soils (Dr J S Bunt), 479
Blumberg, W E , and others Relaxation Enhancement by Paramagnetic Ion Binding in Deoxyribonucleic Acid Solutions, 963
Blumenfeld, L A Structure, Synthesis and Function of Deoxyribonucleic Acid (Electronic Aspects of Nucleic Acid Structure), 24
Blyth, R Appointed editor of the *Pharmaceutical Journal*, 609
Boalch, G T (Armstrong, F A J , and) Ultra-violet Absorption of Sea Water, 858
Bobranski, B , and Syper, L Microchemical Techniques (Paper Chromatography applied to the Identification of Drugs containing Unsaturated Radicals following Reaction with Mercuric Acetate), 412
Bobrov, Prof A M Astronautics (Cosmological Neighbours of the Earth), 312
Bobtelsky, M Microchemical Techniques (Research Work with Microheterometry in work on the Reactions and Nature of Large Organic Molecules), 411
Boccacci, M , and others Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays, 573
Bochénski, Dr I M A History of Formal Logic (translated and edited by Ivo Thomas), *review* by F I G Rawlins, 693
Bocks, Sheila M Nutritional Requirements for the Induced Formation of Malic Enzyme in *Lactobacillus arabinosus* (17-5), 89
Boddy, Keith Radioactivity in Rainfall during September 1961 following the Russian Nuclear-Weapons Tests of September 1961, 443
Bodies (Dense Cytoplasmic), in Radiation-induced Giant Cells of the Cultured Fibroblast Increase in the (Dr A F Hayward), 891
Bodies (Inclusion), containing Deoxyribonucleic Acid Detection of, by means of Autoradiography (Dr Moshe Aronson and Dr Sanford S Elberg), 981
Bodvarsson, G , and Jonsson, J Fluctuations in Marine Populations in Icelandic Waters, 768
Body Fluids Blood and other (Analysis and compilation by Philip L Altman , edited by Dorothy S Dittmer), *review* by Sir Hans Krebs, 591
Bogle, Dr G S At the Third Australian Spectroscopy Conference (Development of the Theory of Electron Paramagnetic Resonance), 929
Bogle, Dr G S , and others At the Third Australian Spectroscopy Conference (Electron Paramagnetic Resonance Properties of Cystine and related Compounds after Irradiation with Mercury 2537 Å Radiation and a Sun-lamp (Peak ~ 3100 Å)), 929
Bohr, Prof Niels At the Rutherford Jubilee International Conference on Nuclear Physics, 794
Boiling Points of some Alcohols Effect of Strong Electrical Fields on the (Richard K Lyon), 1285 , (Dr P K Katti and M M Chaudhri), 1286
Bokhoven, C , and Niessen, H J Amounts of Oxides of Nitrogen and Carbon Monoxide in Cigarette Smoke, with and without Inhalation, 458
Bollard, Dr E G Quantitative Biology (Utilization of various Organic Nitrogen Compounds as Sole Sources of Nitrogen), 25
Bolting and Flowering Effects on Senescence A Distinction between (Prof Jules Janick and A C Leopold), 887
Bolton, J R , and Carrington, Dr R Spectroscopic Studies using Time-Resolved Techniques, 1034
Boltt, R E Antennary Feeding of the Hermit Crab *Diogenes brevirostris* Stimpson, 1099
Bombyx mori (Silkworm) Effect of Dietary Ascorbic Acid on the (Dr Toshio Ito), 951
  Properties of Xanthine Dehydrogenase in the (Yoshiyuki Hayashi), 756
Bond, D C (Bullock, J A , and) Control of the Army Worm on Grazing in Kenya, 480
Bonding (Chemical), in Binary Compounds A Quantitative Theory of the Character of (Prof Edward Gorlich), 133
Bonding (Hydrogen) Participation of Imidazole in Intramolecular (Prof A Lukton) 422
Bonding (Hydrogen), in Alkyl Phosphonic and Alkyl Phosphonothionic Acids (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Bonding (Hydrogen), of Water in Bovine Serum Albumin Solutions Nuclear Magnetic Resonance Spectroscopy of Proteins—the (F A Bovey), 324
Bonding (Ionic-Covalent), in Crystals (C H L Goodman), 355 , (E Mooser and W B Pearson), 355
Bone Soluble Collagen in (S Araya, Dr S Saito, S Nakanishi and Y Kawanishi), 758
Bone (Stressed) Staining Properties of (Prof M A MacConaill), 368
Bone Marrow (Homologous), or Spleen Cells Transfer of Immediate (Anaphylactic) Hypersensitivity by (Dr V Stankovic and S Vlahović), 762
Bone Marrow (Human), treated with Human Deoxyribonucleic Acid Formation of Different Haemoglobins in Tissue Culture of (Prof Lorraine M Kraus), 1055
Bone-Marrow Cells from the Cadaver Persistence of Motility in (Dr I B Porteous), 569
Bonné, Batsheva, and others Third Molar Polymorphism and the Timing of Tooth Formation, 989
Bonner, W A , and Hundley, L L Scanning Techniques in Biological and Medical Microscopy (Techniques for Simultaneous Illumination of the Specimen with both Visible and Ultra-violet Light), 1031
Book of Science Verse (selected by W Eastwood), *review* by T R Henn, 98
Book (Text-), of Inorganic Chemical Analysis, *review* by Dr G Kakabadse, 836
Books Scientific and Technical, clxvi, October 28, cccxliii, November 25, dlxiv, December 30
Books (Physics Text-) A New Look in, *review* by G R Noakes, 99
Booth, Dr A D Universal Language for Computing Machines, 22
Booth, Dr A N Biochemistry of Plant Phenolic Substances (Metabolic Fate of Phenolic Substances in Animals), 418
Boothroyd, B , and others Venturicidin, a New Antifungal Antibiotic of Potential Use in Agriculture, 952
Bor, Dr N L Wunderwelt Kakteen, *review*, 1223
Borasky, Dr Rubin Ultrastructure of Protein Fibers—Collagen, Muscle and Keratin, 610
Boring, J R , and Pratt, Prof D Spheroplasts of Marine Bacteria induced by the Action of Penicillin, 773
Borkowska, Z (Taube, M , and) Organic Extraction from Fused Uranium Chlorides, 745
Borkowski, T , and others Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the Central Nervous System of the Rat, 456

Bortz, W M , and others Particle Involvement in Fatty Acid Synthesis in Liver and Yeast Systems, 1287
Boss, Dr Jeffrey M N , and others Antidiuretic Hormone and Renal Collecting Tubules, 76
Botanical Institute (Montpellier) Symposium on the Methodology of Plant Eco-Physiology, 1241
Botanical Panopticon, *review* by R D Meikle, 1221
Botanical Survey of India Appointment of Prof H Santapau as superintendent, 606
Botany in University College, Dublin, 1236
Botany Radiation, Vol 1, No 1, 404
Bott, Dr M H P Interpretation of Geophysical Surveys (Treatment of Gravity and Magnetic Survey Data) 1242
Bouchard, Prof M The Universities in France—Freedom and Autonomy, 212
Boulter, D , and others Cytochrome c Oxidase, the Terminal Oxidase of *Iris pseudacorus* L , 579
'Bound' Gibberellin in Mature Runner Bean Seeds (A J McComb), 575
Boundaries (Grain) Embrittlement of, by Equilibrium Segregation (J H Westbrook and D L Wood), 1280
Boundary Layer Theory (Dr Hermann Schlichting), fourth edition, translated by Dr J Kestin, *review* by E J Watson, 842
Boundary-Layer Theory (Laminar) New Methods in (Dr D Meksyn), *review* by E J Watson, 842
Boundary Layer Thickness in Electrolytic Systems Evaluation of, from Decay of Anode Concentration Polarization (Leonard Nanis), 449
Boundary Layers Theory of, *review* by E J Watson, 842
Bourne, Prof E J Wood Extractives (New Methods for the Characterization and Separation of Extractives), 511
Bourne, Dr Geoffrey H (edited by, assisted by Eileen M H Wilson) World Review of Nutrition and Dietetics, Vol 2, *review* by Dr W R Aykroyd, 1006
Boutflour, Prof Robert *Obituary* by W T Price, 1021
Bovey, F A Nuclear Magnetic Resonance Spectroscopy of Proteins—the Hydrogen Bonding of Water in Bovine Serum Albumin Solutions, 324
Bovine Growth Hormone Determination of the Amino-Acid Composition of (Dr Alan J Parcells), 971
Bovine Serum Albumin Solutions Nuclear Magnetic Resonance Spectroscopy of Proteins—the Hydrogen Bonding of Water in (F A Bovey), 324
Bovine Spermatozoa Freeze-drying of (R G Saacke and Prof J O Almquist), 995
Bowden, Dr F P , and Chadderton, L T Molecular Disarray in a Crystal Lattice produced by a Fission Fragment, 31
Bowen, V T (Nicholls, Dr G D , and) Natural Glass from beneath Red Clay on the Floor of the Atlantic, 156
Bowman, R H Growth Hormone Activity of the Anterior Pituitary Lobe of the Male Rat at various Ages, 976
Boyd, Helen (Brandon, K W , and) Release of Noradrenaline from the Spleen of the Cat by Acetylcholine, 880
Boyd, Hugh, and Scott, Peter Twelfth Annual Report of the Wildfowl Trust (1959-1960), 308
Boyd, Dr I A Muscle Receptors (Whole Structure of Muscle Spindles in the Cat), 805
Boyd, J Awarded the Service Medal of the Textile Institute, 406
Boyer, Paul D , and others (edited by) The Enzymes, Vol 2, Purine and Pyrimidine Nucleotides and Phosphagens, Prosthetic Groups and Cofactors (Part A), second edition , Vol 3, Prosthetic Groups and Cofactors (Part B) , Vol 4, Hydrolytic Cleavage (Part A), second edition, *review* by Dr Edwin C Webb, 1109
Boyer, Prof P D , and others Detection of a Possible Intermediate in Oxidative Phosphorylation, 43
Boyle, Patricia J , and Kavanagh, James A A Spartinetum at Baldoyle in Ireland, 81
Boyle, Honourable Robert A Bibliography of the, Fellow of the Royal Society (Prof John F Fulton), second edition, *review* by V A Eyles, 851
Brachyura Larvae Fluctuations in Hormone Activity in (John D Costlow, jun), 183
Bradbury, Dr S Histological and Histochemical Technics, *review*, 904
  Practical Microscopy, *review*, 904
  Section Cutting in Microscopy, *review*, 904
Bradford Chemical Society, and others Symposium on Antibiotics and Newer Synthetic Drugs, 1132
Bradford Institute of Technology Course on Chemical Applications of Diffraction Methods, 21
Bradford Institute of Technology (Department of Chemical Technology), and others Symposium on Antibiotics and Newer Synthetic Drugs, 1132
Bradley, E M Awarded the Charles Babbage Award of the British Institution of Radio Engineers, 609
Bradley, Dr J E S , and Marks, J Method of Measuring the Mossbauer Effect, 1176
Bradley, P B , and others (edited by) Proceedings of the First International Congress of Neuro-Psychopharmacology (Rome, 1958), *review* by Prof W Ross Ashby, 392
Bradshaw, Prof Eric *Obituary* by Dr C Adamson, 111
Brady, Lynn R , and others Occurrence of Sedoheptulose in Carpophores and Basidiospores of *Inocybe* Species, 1080
Bradykinin (Dr G P Lewis), 596
Bradykinin in Rats Hypertensive Effects of (H Croxatto and J Belmar), 879
Bradykininogen in Blood Plasma A Micromethod for the Determination of (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Braganca, Beatriz M (Krishnamurthy, V , and) Inactivation of *A*-Methopterin by the Acetylating Enzyme System from Pigeon Liver, 68
Bragg, Sir Lawrence Christmas Lectures on Electricity (Royal Institution), 1026
Bragg, S L Astronautics (Operation and Control of Liquid Propellant Rocket Engines), 312
Brain, Sir Russell The Neurology of Language, 20
  Speech (Anatomy and Psychology of Language), 601
Brain Effect of X-Irradiation on Self-Stimulation of the (Dr Thomas J Haley, P Bach-y-Rita and N Komesu), 1309
  Phenylalanine as Inhibitor of Transport of Amino-Acids in (K D Neame), 173
Brain (Cat) Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the Electrical Activity of the (Dr [illegible] Mihailović and Dr B D Jankovic), 665
Brain (Rat) Effects of Electrical Stimulation of Reticular Formation on the Lactic Acid Content of the (Dr Lj Mihailovic, Lj Krzalić and D Cvetković), 1166
Brain (Rat Liver and) Effects of 7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide on Mitochondria from (Bernhard Kadenbach and Prof Walter Luhrs), 174
Brain Surgery (Pupal) Effect of, on the Rocking Response of *Automeris* (Dr A D Blest), 373
Braithwaite, Prof R B At the Sixth Annual Conference of the British Society for the Philosophy of Science (Learning Machines), 508
Brandly, C A , and Jungherr, E L (edited by) Advances in Veterinary Science, Vol 6, *review* by Prof Harold Burrow, 198
Brandon, K W , and Boyd, Helen Release of Noradrenaline from the Spleen of the Cat by Acetylcholine, 880
Brandt, John C , and Hodge, Paul W Lunar Dust and the Gegenschein, 957
Brañez, E , and Roels, H Variations in the Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the Female White Rat during the Œstrual Cycle, 1043
Bransom, Dr S H Crystallization, *review*, 695

Butler, Dr R A Gas Chromatography in Medical Research (Parts per Million and All That), 718
Butt, Dr V S Light and Life, *review*, 296
Butzer, K W Changes of Climate, 1139
Byvoet, Paul, and Busch, Prof Harris Binding of *RP2-L*—a Nuclear Protein of Neoplastic Tissues—to Deoxyribonucleic Acid, 870

CABBAGE (Goitrogenous and Non-Goitrogenous) Cultivation of (J Sedlak), 377
Cadaver Persistence of Motility in Bone-Marrow Cells from the (Dr I B Porteous), 569
Cadman, Dr C H Promoted to Senior Principal Scientific Officer, 215, work of, 215
  Mechanisms of Virus Infections (Mechanisms of Virus Entry and Spread within the Host), 1246
Cadmium Nitrate (Urea) Crystallographic Data for Urea Calcium Nitrate and (Dr C G C Catesby), 254
Caen, Dr J, and others Antithrombin Activity of Normal and Pathological Cerebrospinal Fluid, 1164
Caesium-137 and Strontium-99 in Precipitation, Soil and Animals in Norway (T Hvinden and A Lillegraven), 1144
Caffeic (*Trans*-) Acid isolated from *Coleus rhenaltianus* Growth-stimulating Activity of (Dr J C Vendrig and K Buffel), 276
Cain, Prof J C (Chan, Bock G, and) Improved Benzidrine Sugar Reagent for Paper Chromatograms, 69
Calcium Modification of the Inotropic Activity of, by Potassium (Winifred G Nayler), 268
Calcium as a Link in Stimulus-secretion Coupling Mechanism of Nicotinic Action at the Adrenal Medulla— (Prof W W Douglas and R P Rubin), 1087
Calcium in Saliva Application of Atomic Absorption Spectroscopy to the Determination of (Ernest Newbrun), 1182
Calcium-45 in the Adrenal Gland Stimulation of Uptake of, by Acetylcholine (Prof W W Douglas and A M Poisner), 1299
^{45}Ca-Metabolism Generalized Skeletal Response on Local Trauma in Young Rats studied by means of (Dr Jaromír Kolař and Dr Arnošt Babicky), 1297
Calcium Nitrate (Urea), and Urea Cadmium Nitrate Crystallographic Data for (Dr C G C Catesby), 254
Calcium Oxide Electrical Conductivity of, at High Electric Fields (Dr C H B Mee), 350
Calculators (Mechanical Barrel-setting) Reciprocals of the Integers from 1000 to 9999, with an Appendix on (T H Redding), *review* by Prof T A A Broadbent, 856
Calculi (Uncrystallized Urinary) Excretion of, composed of Glycolipo-Protein by Normal and Muscular Dystrophic Mice (C McGaughey), 1267
Calcutt, Dr G (Harper, K H, and) *In vivo* and *in vitro* Inhibition of Aromatic Hydroxylation by Riboflavin, 165
Calcutt, Dr G, and others Riboflavin and Liver Sulphydryl-Levels in Mice, 164
Caldecote, Viscount At the Annual Conference of the Library Association (An Industrialist's View and Criticism of Library and Information Services), 931
Calderbank, Prof P H Biochemical Engineering, 120
Calibrating Two-Sphere Non-directional Radiometers A Method of (Dr. Walter Koch), 960
Calibration (Optical), of some Monodisperse Polystyrene Latexes in Arrays (Dr Herbert E Kubitschek), 1148
Caliper for the Size of Protein Molecules Montmorillonite as a (Prof A D McLaren and G H Peterson), 960
Callaway, Dr Enoch (Ellman, Dr George L and) Erythrocyte Cholinesterase-Levels in Mental Patients, 1216
Callear, Dr A B The Study of Fast Reactions (Ultra-violet Spectroscopy and Fluorescence), 1136
Calliphora vomitoria L (Insect) Intestinal Proteinases in an (Dr Alastair Fraser, Richard A Ring and Robin K Stewart), 999
Calves Comparative Effects of Wet and Dry Feeding on the Utilization of Protein by (A M Raven and K L Robinson), 1256
Calvin, Prof M Awarded the Nobel Prize for Chemistry, 799, work of, 799
Cambrian Rocks (British) Differential Secondary Magnetization in some (D E T Bidgood), 39
Cambridge Instrument Co, Ltd List 177/2, Microsan X-Ray Analyser, 220
  New Instrument Assembly Wing of the (J G Hammond), 924
Cambridge Physical Chemistry Summer School The Study of Fast Reactions, 1136
Cambridge Rheology Club Exhibition of Rheological Equipment, 308
Campbell, Dr B G The Systematics of Man, 710
Campbell, Dan H, and others Identification of Antibody in β_2-Globulins of Mouse Serum and Ascitic Fluid, 885
Campbell, K C Appointed to a lectureship in chemistry in the University of Glasgow, 1132
Campbell, Tod W (Sorenson, Wayne R, and) Preparative Methods of Polymer Chemistry, *review* by Dr I C McNeill, 490
Campredon, Prof J At the Thirteenth Congress of the International Union of Forest Research Organizations (Mechanical Conversion), 615
Canada Research Grants in Science and Medicine in, 308
Canada, National Research Council of Forty-fourth Annual Report (N R C 6322), 709
  Review of the, for 1961 (N R C 6421), 709
  Appointment of Dr A C Neish as director of the Atlantic Regional Laboratory, 1129
Canada, National Research Council and Medical Research Council of. University Support (1960-61), 308
Canadian Salmon caught off Greenland (C J Kerswill and M H A Keenleyside), 279
Canadian Uranium Research Foundation Grant of 10,000 dollars a year to the British Columbia Research Council, for investigation into the use of uranium compounds as toxicant additives to wood impregnants for marine borers, 516
Cancer Chemistry of Enzymes in (Prof Franz Bergel), *review* by Dr L H Stickland, 100
  Enzymes and, *review* by Dr L H Stickland, 100
Cancer of the Rectum (edited by Dr Cuthbert E Dukes), *review* by Dr Francis J C Roe, 197
Cancer Campaign (British Empire) Thirty-eighth Annual Report (1960), 1251
Cancer Progress, 1960 (edited by Ronald W Raven), *review* by Dr F J C Roe, 298
Cancer Research Progress in, *review* by Dr F J C Roe, 298
  Progress of (D G Arnott, Dr I Hieger and A L Levene), 1251
Cancer Research in the University of Perugia Medical School (Prof Lucio Severi), 217

Cancer Research (Fundamental) Sixteenth Annual Symposium on—Conceptual Advances in Immunology and Oncology (University of Texas), 1132
Candida albicans Reversal of Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine for, by Pyridoxine and Pyridoxamine (Dr M L Littman and Dr T Miwatani), 1155
Candler, C At the Third Australian Spectroscopy Conference (Theory of the Photographic Characteristic and its use in Plate Calibration), 928
Candreviotis, Prof N (Doxiadis, Prof Th, and) Establishment of Amoebic Hepatitis as a Distinct Clinico-Pathological Entity, 988
Cantow, Manfred J R, and others Large-Scale Polymer Column Fractionation, 752
Capacities (Cation-Exchange), of Tissues of Higher and Lower Plants and their related Uronic Acid Contents (A H Knight, W M Crooke and R H E Inkson), 142
Capacity to Bind Anti-Toxin A Subcellular Component of *Corynebacterium diphtheriae* with the (Prof M Yoneda and M Matsuda), 642
Caprylic Acid Formation of 2-Heptanone from, by Spores of various Filamentous Fungi (R F Gehrig and Prof S G Knight), 1185
Carbohydrate O-Isopropylidene Derivatives Chromatographical Separation of (J E G Barnett and Dr P W Kent), 556
Carbohydrates, Cellulose and Cellulose Industries (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 609
Carbon-14 Isolation of an Unknown Auxin from a Solution of Indole-3-Acetic Acid labelled with (Prof J H M Henderson), 1076
Carbon Formation (Pyrolytic), from Carbon Suboxide (B C Banerjee, T J Hirt and Prof P L Walker, jun), 450
Carbon-Functional Organic Silicon Compound, Dimethyldi-(4-hydroxyphenyl)-silane Allergy to a (Dr Sigfrid Fregert and Dr Hans Rorsman), 989
Carbon Monoxide Amounts of Oxides of Nitrogen and, in Cigarette Smoke, with and without Inhalation (C Bokhoven and H J Niessen), 458
Carbon Monoxide Oxidation Radiation Effects on Lithium-doped Nickel Oxide Catalysts in (T Braun and I Maxim), 548
Carbon Suboxide Pyrolytic Carbon Formation from (B C Banerjee, T J Hirt and Prof P L Walker, jun), 450
Carbon Tetrachloride Protection by Antioxidants against Lethal Doses of (Dr C H Gallagher), 881
^{14}C-Glycine Incorporation of, by Sub-Nuclear Preparations from Rat Liver Nuclei (K R Rees, Hazel F Ross and G F Rowland), 171
^{14}C-Œstrone Interaction of, with Tryptophan in the Presence of Peroxidase (Dr P H Jellinck and Louise Irwin), 660
2-^{14}C-Pteroyl-L-Monoglutamic Acid Conversion of, into Isoxanthopterin in *Drosophila melanogaster* (Dr J A Blair), 757
Carbonaceous Chondrites A Microbiological Examination of some (Dr George Claud and Prof Bartholomew Nagy), 594
Carbonates A Difference Band of a Fundamental and a Lattice Mode in the Infra-red Spectra of Lead and other (C J H Schutte and K Buijs), 351
Carbonatite (Pegmatitic), in a Syenite–Marble Contact Formation of (R D Schuiling), 1280
Carbonatitic Lava from Fort Portal Area in Western Uganda (Dr O von Knorring and Dr C G B du Bois), 1064
Carbonization (Low Temperature), of Non-caking Coals and Briquetting of Coal Fines (Regional Research Laboratory, Hyderabad, Symposium on), 406
Carbonyl Compounds Role of Keto-Enol Tautomerism in the Polarographical Reduction of some (Dr P Zuman and Dr J Michl), 655
Carbonyl Content of the Vitrain Component of Bituminous Coals (Dr K Littlewood and M T Monaghan), 128
Carboxyl Groups in Conjugation with the Porphyrin Ring System Detection of (P S Clezy), 750
Carcinogen-induced Tumours in Mice Chromosomal Lesion associated with (June Lee Biedler, Lloyd J Old and Dr Donald A Clarke), 286
Carcinogenic Action of Testosterone, provoking Uterine Tumours in Mice (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
Carcinogenic *N*-Methyl-Nitrosourethane Interaction of the, with Sulphydryl Groups (Dr R Schoental), 670
Carcinogenicity of Dibenzo (*a*,l)pyrene (Ernest L Wynder and Dietrich Hoffmann), 1092
Carcinogenicity of the Methyl-1,2-Benzanthracenes and their Derivatives (Dr O Chalvet and Dr R Mason), 1070
Carcinogens (Skin) An Early Test for Possible (Olav Hilmar Iversen), 273
Carcinoma (Ehrlich Ascites), in Mice Action of Deoxyribonuclease and Ribonuclease on the Growth of (Dr Gaston de Lamirande), 52
Carcinoma (Intestinal), of the Newt Two Types of Ribonucleoprotein in the Nucleolus of, following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Carcinoma Cells (Mouse Mammary) Nucleolar Succinic Dehydrogenase in (P De, R Chatterjee and Dr S Mitra), 285
Carcinus maenas Respiratory Chain Phosphorylation in Sub-Cellular Particles isolated from the Hepatopancreas of (Dr R B Beechey), 975
Cardiac Output New Indirect Fick Procedure for the Determination of (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
Cardiff, E A, and others Interaction of Light and Atmospheric Photochemical Products ('Smog') within Plants, 814
Caribbean (British), Standing Advisory Committee for Medical Research in the Sixth Scientific Meeting, 26
Carlisle, Dr D B Endocrinology and Evolution (Some Problems of Crustacean Endocrinology), 797
Carnaghan, R A, and others Toxicity associated with certain Samples of Groundnuts, 1096
Carnegie, P R Separation of Low Molecular Weight Peptides from Amino-Acids on 'DEAE-Sephadex', 658
Carotenoids Biosynthesis of, in Purple Bacteria—a Re-Evaluation based on Considerations of Chemical Structure (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Carpenter, E W, and others Microbarograph Records from the Russian Large Nuclear Explosions, 857
Carpet Snake Precipitating Antibodies in the, against Parasitic Nematodes (H Timourian, C Dobson and J F A Sprent), 996
Carpophores and Basidiospores of *Inocybe* Species Occurrence of Sedoheptulose in (Robert G Benedict, Prof Varro E Tyler, jun, Lynn R Brady and Daniel E Stuntz), 1080
Carr, Dr J G, and Shimwell, J L Dihydroxyacetone Production in *Acetomonas*, 683
Carriers (Heterozygous), and Patients with Liver Glycogen Disease (Von Gierke's Disease) Blood Glucose-6-Phosphate in (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265; (Dr David Yi-Yung Hsia), 266
Carrington, Dr A (Bolton, J R, and) Spectroscopic Studies using Time-Resolved Techniques, 1034
Carrington, S, and others Gamma-Globulin and Acquired Immunity to Human Malaria, 733
Carroll, Kenneth G (Mellors, Robert C, and) A New Method for Local Chemical Analysis of Human Tissue, 1090
Carroll, Prof K K Quantitative Estimation of Peak Areas in Gas-Liquid Chromatography, 965
Carruthers, Dr W, and Douglas, A G 1,2-Benzanthracene Derivatives in a Kuwait Mineral Oil, 256
Cartilage Histochemical Localization of Uridine Diphosphoglucose Dehydrogenase in (Dr Karoly Balogh, jun, and Richard B Cohen), 1199
Cartilage (Rachitic Epiphyseal), of Albino Rat Free Amino-Acids in, and the Influence of Vitamin D (G V G Krishna Rao), 269
Cartwright, B (Brown, F, and) Dissociation of Foot-and-Mouth Disease Virus into its Nucleic Acid and Protein Components, 1163
Carvalho, Ivan F, and others A Micromethod for the Determination of Bradykininogen in Blood Plasma, 1194
Case Studies The Preparation and Use of (South London Branch of the British Institute of Management Conference on), 21
Casein Variants (Inherited), in Cow's Milk (Dr R Aschaffenburg), 431
Caspersson, T O Scanning Techniques in Biological and Medical Microscopy (Mechanical, Optical and Electronic Systems of Scanning), 1031
Cat Release of Noradrenaline from the Spleen of the, by Acetylcholine (K W Brandon and Helen Boyd), 880
Cat Brain Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the Electrical Activity of the (Dr Lj Mihailović and Dr B D Janković), 665
Catabolism (Plasma Albumin), in Experimental Nephrosis (Dr Alvin L Sellers, Joseph Katz and Sheldon Rosenfeld), 562
Catalogue of Courses on Nuclear Energy in O E E C Countries, 1961-1962 (Organization for Economic Co-operation and Development), new edition, 405
Catalysis (Heterogeneous) Dislocations as Active Centres in (Ituro Uhara, Sadao Yanagimoto, Kazuo Tani and Gin'ya Adachi), 867
Catalysts (Lithium-doped Nickel Oxide) Radiation Effects on, in Carbon Monoxide Oxidation (T Braun and I Maxim), 548
Catalysts (Platinum–Alumina) Valence State of (R J Bertolacini), 1179
Catalytic Decomposition of Ethylene on Nickel (Douglas W McKee), 654
Catch-rates and Composition (Trawl Fishing in the Tropical Atlantic), (R H Lowe (McConnell) and Alan R Longhurst), 620
Catcheside, Prof D Chemistry in the Service of Medicine (Relationship between Chemistry and Genetics), 1018
Catecholamines Inhibitory Properties of the (Prof E G McGeer, P L McGeer and H McLennan), 563
Catecholamines (Particle-bound and Free), in Dog Hearts and the Uptake of Injected Norepinephrine (A Wegmann and K Kako), 978
Catesby, Dr C G C Crystallographic Data for Urea Calcium Nitrate and Urea Cadmium Nitrate, 254
Catfish Barbels Response of, to Taste Stimuli (Hideki Tateda), 343
Cathodes of 77 per cent Palladium and 23 per cent Rhodium Hydrogen Over-voltage at (J C Barton and Dr F A Lewis), 549
Cation-Exchange Capacities of Tissues of Higher and Lower Plants and their related Uronic Acid Contents (A H Knight, W M Crooke and R H E Inkson), 142
Cation Toxicity and the Stability of Transition-Metal Complexes (Dr William H R Shaw), 754
Cations (Monovalent) Effect of, on the Blood Pressure of Intact and Hypertensive Rats (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Cations (Trivalent), in Crystalline Potassium Chloride Incorporation of (Dr Marian E Hills and Prof Allen B Scott), 1066
Cats Production of Aortic Occlusion resembling Acute Aortic Embolism Syndrome in (Roy K Inhoff), 979
Cattle Blood and Serum Groups in Reindeer compared with those in (Bo Gahne and Jan Rendel), 529
  Diuresis due to Stress in (R S Anderson), 460
Caudatus Antibody (Intraventricularly Injected Anti-N) Effects of, on the Electrical Activity of the Cat Brain (Dr Lj Mihailović and Dr B D Janković), 665
Causes (Possible) for Production of Isoleucine by *Streptomyces rimosus* (Dr I Horvath, I Gado and A Szentirmai), 641
Cavallini, D, and others Detection and Distribution of Enzymes for oxidizing Thiocysteamine, 557
Cavity Ionization Chambers Measurement of Stopping-Power Ratio for (T E Burlin), 545
Cawkell, E M, and others The Falkland Islands, *review* by Dr R J Adie, 853
Cawkell, M B R, and others The Falkland Islands, *review* by Dr R J Adie, 853
Cell The Bacterial, *review* by Dr S Dagley, 489
  Types of, in Ascites Tumours (Dr John O Laws), 78
Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various Pore Sizes (G K Ackers and R L Steere), 436
Cell (Bacterial) Synthesis and Organisation in the (Dr E F Gale), *review* by Dr S Dagley, 489
Cell (Human Red Blood) Metabolism of the (Dr D Mendelsohn), 619
Cell (Mast) Lytic Antibodies (Dr I Mota), 1201
Cell (Mast) Turn-over in Adult Mice (Prof Bruce E Walker), 980
Cell (Red) Enzyme Deficiency Absence of, in Australian Aborigines (Prof O Budtz-Olsen and Dr Chev Kidson), 765
Cell (Red Blood) Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep Relationships between (Prof J V Evans), 567
Cell (Sheep Interstitial) Stimulating Hormone Complement-fixing Antibodies to Human Growth Hormone and (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Cell (Spleen) Injection in Adult Mice Acquired Tolerance to Homografts produced by Homologous (Ronald D Guttmann and J Bradley Aust), 564

Cell (Unit) Space Group and, of the *m*-Bromobenzoate of Photoisopyrocalciferol (Prof G L Hardgrove), 551
Cell Culture Antigenicity of Guinea Pig Testicular Cells grown in, as determined by the Isolated Ileum Technique (Dr Seymour Katsh and Dr Russell T Jordan), 770
Cell Cultures (Serum-free) Cytopathic Protective Factor, its Production by Normal Uninfected (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Cell Division Importance of, for Antibody Production in an *in vitro* System (R W Dutton), 462
  Role of, in Gastrulation of the Viviparous Toothcarp *Xiphophorus helleri* (Prof A Stolk), 374
Cell Migration during Histogenesis of Cerebral Cortex in the Mouse Autoradiographic Study of (Dr J B Angevine, jun , and R L Sidman), 766
Cell Numbers in Leaf Primordia Determination of (Dr E J Hewitt and L A Wilson), 578
Cell Reduction in the Embryonic Development of the Cestode *Diorchis ransomi* Schultze, 1940 (Krystyna Rybicka), 771
Cell Walls (Algal) Variants in the Structural Polysaccharides of (Dr Eva Frei and Prof R D Preston), 939
Cells in Evolution, *review* by Dr I Leslie, 4
Cells (Ascites Tumour) Acylase Activity of, on Dichloroacetyl Derivatives of Amino-Acids (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
  Intracellular Response to an Iso-immune Reaction at the Surface of (D C Dumonde, Clarice G Walter, Lucille Bitensky, Prof G J Cunningham and J Chayen), 1302
Cells (Bone-Marrow), from the Cadaver Persistence of Motility in (Dr I B Porteous), 569
Cells (Frog Renal) Cultivation of Monolayer Cultures of (Dr Walter Auclair), 467
Cells (Goblet), in the Swim Bladder of *Ophiocephalus striatus* (Bloch), (A S Monie), 1313
Cells (Guinea Pig Testicular), grown *in vitro* Spermatocytogenesis with Possible Spermiogenesis of (Dr Russell T Jordan, Dr Seymour Katsh and Nadia de Stackelburg), 1053
Cells (Guinea Pig Testicular), grown in Cell Culture Antigenicity of, as determined by the Isolated Ileum Technique (Dr Seymour Katsh and Dr Russell T Jordan), 770
Cells (HeLa) Reproduction of Tick-borne Encephalitis Virus in (Dr H Libíkova and Dr P Albrecht), 779
  Serial Propagation of Types 1, 2, 3 and 4 Dengue Virus in, with Concomitant Cytopathic Effect (Sonja M Buckley), 778
Cells (Human White) Culture of, using Differential Leucocyte Separation (James Hastings, Stanley Freedman, Orlando Rendon, Herbert L Cooper and Kurt Hirschhorn), 1214
Cells (Incubated Rat Red), *in vitro* Effect of Hydrocortisone on the Uptake of Iron-59 in (Peggy Clark), 667
Cells (Living) Prevention of Freezing Damage to, by Pyridine *N*-Oxide (T Nash), 360
Cells (Lyophilized Bacterial), exposed to Oxygen Electron-Spin Resonance Signals from (Dr M B Lion, Dr J S Kirby-Smith and Dr M L Randolph), 34
Cells (Mouse Lymphoma), with Different Radiosensitivities (Dr P Alexander and Z B Mikulski), 572
Cells (Mouse Mammary Carcinoma) Nucleolar Succinic Dehydrogenase in (P De, R Chatterjee and Dr S Mitra), 285
Cells (Normal and Tumour Strain) Action of Radiation on Synthesis of Deoxyribonucleic Acid in (Dr John Seed), 944, *erratum*, 1241
Cells (Plant) Electrolytes and (Prof G E Briggs, Dr A B Hope and Prof R N Robertson), *review* by Dr James F Sutcliffe, 831
Cells (Radiation-induced Giant), of the Cultured Fibroblast Increase in the Dense Cytoplasmic Bodies in (Dr A F Hayward), 891
Cells (Red) Adenosine Diphosphate in, as a Factor in the Adhesiveness of Human Blood Platelets (A Gaarder, Dr J Jonsen, Prof S Laland, Dr A Hellem and Prof P A Owren), 531
  Effect of Quinones on the Uptake of Oxygen by (D Lovell and Dr T A J Prankerd), 561
  Thromboplastic Activity of (Prof Armand J Quick), 882 , (Dr James A Inglis and Dr June W Halliday), 882
Cells (Red Blood) Agglutination and the Electrical Surface Potential of (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Cells (Rous Sarcoma) Ultrastructural Alterations during the Crabtree Effect in (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
Cells (Sheep Red Blood) Utilization of, in the Haemadsorption Test for Myxoviruses (H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Cells (Single) Electrical Activity of (edited by Yasuji Katsuki), *review* by Dr P Fatt, 203
Cells (Spleen) Transfer of Immediate (Anaphylactic) Hypersensitivity by Homologous Bone Marrow or (Dr V Stankovic and S Vlahović), 762
Cellular Dose and Age of Host in the Induction of Tolerance (Dr L Brent and Dr G Gowland), 1265
Cellular Slime Mould *Dictyostelium mucoroides* . Trehalose in the (James S Clegg and Michael F Filosa), 1077
Cellular (Extra- and Intra-) Stages of Gregarine and Coccidian Protozoa Periodic Acid–Schiff Technique for the Demonstration of (Dr J B Jennings), 473
Cellular (Sub-) Particles Simplified Technique for Isolation of (Dr David W E Smith) 234
Cellular (Sub-) Particles isolated from the Hepatopancreas of *Carcinus maenas* Respiratory Chain Phosphorylation in (Dr R B Beechey), 975
Cellulose and Cellulose Industries Carbohydrates, (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 609
Cellulose Industries Carbohydrates, Cellulose and (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 609
Celmer, W D (Nickell, Dr L G , and) A Potent, Non-Toxic Plant-Growth Inhibitor from an Antibiotic Fermentation, 1098
Centenary of Plastics 1862-1962, 505
Central Action of 5-Hydroxytryptamine and Noradrenaline (Dr D R Curtis and Dr R Davis), 1083
Central African Freshwater Fishes Feeding Habit of some (H Matthes), 78
Central Electricity Generating Board Symposium on the Thermionic Generation of Electricity, 611
Central Nervous System of the Rat Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
Central Synapses (Molluscan) Cholinergic Transmission Mechanisms for both Excitation and Inhibition in (Dr L Tauc and Dr H M Gerschenfeld), 366
Central Treaty Organization (Scientific Council of the) Symposium on the Role of Science in the Development of Natural Resources with particular reference to Iran, Pakistan and Turkey, 609
Centres (Active), in Heterogeneous Catalysis Dislocations as (Ituro Uhara, Sadao Yanagimoto, Kazuo Tani and Gin'ya Adachi), 867
Ceramic Industry (British) Rocks and Minerals used by the (Exhibition of, at the Geological Museum, London), 21
Ceramic Society, British (Basic Science Section) Meeting on Ceramics in Nuclear Science, 21
Ceramics Geology and (Dr P J Adams), 21
Ceramics in Nuclear Science (Basic Science Section of the British Ceramic Society Meeting on) 21
Cerebral Arteries (Extracranial) Cerebral Infarction—the Role of Stenosis of the (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Cerebral Cortex in the Mouse Autoradiographic Study of Cell Migration during Histogenesis of (Dr J B Angevine, jun , and R L Sidman), 766
Cerebral Infarction—the Role of Stenosis of the Extracranial Cerebral Arteries (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Cerebrospinal Fluid (Normal and Pathological) Antithrombin Activity of (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Cerium-144 (Inhaled) Concentration of, in Pulmonary Lymph Nodes of Human Beings (K Liescher, Dr T Schonfeld and A Schaller), 1308
CERN (European Organization for Nuclear Research), Geneva Annual Report (1960), 307
Cestode *Diorchis ransomi* Schultze, 1940 Cell Reduction in the Embryonic Development of the (Krystyna Rybicka), 771
Cetyltrimethylammonium Bromide Repetitive After-discharge produced by Drugs in Nerves treated with (Michiko Okamoto and Prof Albert S Kuperman), 365
Chadderton, L T (Bowden, Dr F P , and) Molecular Disarray in a Crystal Lattice produced by a Fission Fragment, 31
Chagas' Disease in the Matalaque Region, Southern Peru Incidence of (Eleazar Cordova), 921
Chagas' Disease in the Village of Matalaque, Southern Peru Epidemiological Surveys on (Felix Naquira, Eleazar Cordova, Cesar Naquira and Enrique Rubin de Celia), 921
Chaikoff, I L , and others Particle Involvement in Fatty Acid Synthesis in Liver and Yeast Systems, 1287
Chain, Prof E B , and others Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall, 552
α-Chain of Human Haemoglobin Chromium-51 Tagging of the (Prof Amoz I Chernoff), 327
Chain Phosphorylation (Respiratory), in Sub-Cellular Particles isolated from the Hepatopancreas of *Carcinus maenas* (Dr R B Beechey), 975
Chains (Food) The Entry of Fission Products into (edited by L F Loutit and R Scott Russell), *review* by Dr Hugh D Evans, 6
Chalk River Atomic Energy Instrumentation Conference, 802
Chalvet, Dr O , and Mason, Dr R Carcinogenicity of the Methyl-1,2-Benzanthracenes and their Derivatives, 1070
Chamber for Culturing and Collecting the Nematode *Panagrellus redivivus* (E J Winkler and Prof David Pramer), 472
Chan, Bock G , and Cain, Prof J C Improved Benzidrine Sugar Reagent for Paper Chromatograms, 69
Chanarin, Dr I Isotopes in Haematology, *review*, 903
Chance, Dr Britton Scanning Techniques in Biological and Medical Microscopy (Investigations of Respiratory Enzymes by Analysis of the Fluorescence Spectra excited in Single Cells), 1031
  At the Fifth International Congress of Biochemistry (New Effect in the Field of Intracellular Respiration), 1115
Chandler, the late Prof Asa C , and Read, Prof Clark P Introduction to Parasitology, with special reference to the Parasites of Man, tenth edition, *review* by Dr G Lapage, 488
Changes in Adenine Nucleotides in the Muscles of some Marine Invertebrates (Ken-ichi Arai and Tsuneyuki Saito), 451
Changes of Blood Volume in the Pre-Hibernating and Deep-Hibernating Hedgehog (Dr Einar Eliassen), 1047
Changes of Climate (Unesco and the World Meteorological Organization Symposium on), 1139
Changes in the Concentration of Ribonucleic Acid during Wound Tissue Regeneration (Martin B Williamson and Wilhelm Guschlbauer), 454
Changes in Times of International Time Signal (Royal Greenwich Observatory), 1023
Changes (Flagellar), in *Escherichia coli* induced by Temperature of the Environment (Dr Robert B Morrison and Jean McCapra), 774
Changes (Morphological), following Transplantation and Chronic Obstruction of the Rabbit Appendix (J A Williams, W O Griffen, jun , and A Sharma), 877
Chapman, Dr D *Obituary* of Dr Madeline Kerr, 605
Chapman, G P , and Glasgow, S K Incipient Dioecy in Pimento, 1205
Chapman, Prof V J Salt Marshes and Salt Deserts of the World, *review* by Prof W T Williams, 833
Chapman and Hall, Ltd Appointment of B N Hughes as a director, as chief editor for scientific and technical books, 406
Character of Chemical Bonding in Binary Compounds A Quantitative Theory of the (Prof Edward Gorlich), 133
Characteristics (Mode) and Coherence in Optical Ruby Masers (Dr I D Abella and Dr C H Townes) 957
Characteristics (Spectral), of Type II Solar Radio Bursts (Prof P A Sturrock) 58
Characteristics (Temperature), of Bacterial Variation in Legume Symbiosis (Dr J S Pate), 637
Characterization (Histochemical), of a Unique α-Glutamyl Peptidase Activity (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 339

Charcoal Effect of, on the Behaviour of Adenine Nucleotides in Ion-Exchange Chromatography (U Pethiyagoda), 452
Charcoal and 'Sephadex' Purification of Fluorescent Protein Conjugates—Comparison of (Dr J E Fothergill and Dr R C Nairn), 1073
Charge (Surface) and Coagulant Action of Phospholipids A Correlation between (Dr A D Bangham), 1197
Charing Cross Hospital, London Grant of £10,000 from the Wellcome Trust for the Department of Medicine at the Fulham Branch of the, 212
Charles, L M, and Nicol, Prof T Effect of Diethylstilboestrol on the Serum γ-Globulin in the Guinea Pig, 565
Charley, R V, and others Unstable Flow of Molten Polymers, 223
Charts (Tables and), for Use in Gas Dynamic Studies Bibliography of (D E Randall), 308
Chatterjee, I B, and others Biosynthesis of L-Ascorbic Acid—Missing Steps in Animals incapable of Synthesizing the Vitamin, 163
Chatterjee, R, and others Nucleolar Succinic Dehydrogenase in Mouse Mammary Carcinoma Cells, 285
Chatterji, A K Puzzolanic Activity and Semiconductivity of Fired Kaolin and Kaolinitic Clay, 1180
Chattopadhyay, Dhurjati Prasad Transaminase Activity in Arterial Tissue of the Rabbit, 660
Chaudhri, M M (Katti, Dr P K, and) Effect of Strong Electrical Fields on the Boiling Points of some Alcohols, 1286
Chaudhuri, Prof Rafi Mohammed, and Khan, Mustafa Yar Emission of Ultra-Violet and Visible Radiation from Metals by the Impact of High-Energy Hydrogen Ions, 646
Chaudhuri, Sukhen, and Sadhu, D P Thyroid Activity at Higher Ambient Temperatures, 560
Chayen, J, and others Intracellular Response to an Iso-immune Reaction at the Surface of Ascites Tumour Cells, 1302
Cheema, M S, and others (prepared by) Representations of Primes by Quadratic Forms (edited by J C P Miller), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson 97
Chelator (Iron) Production of Chromatid Aberrations by Diepoxybutane and an (Prof Norman S Cohn) 1093
Chelsea Publishing Co, New York Mathematical Reprints, 114
Chemical Analysis Physical Methods in (edited by Walter G Berl), Vol I, second edition, *review* by Dr D T Lewis, 391
Chemical Analysis in Combustion Processes, Gas Sampling and (Prof G Tine), *review* by Dr C F Cullis, 1108
Chemical Analysis (Inorganic) Text-Book of, *review* by Dr G Kakabadse, 836
Chemical Analysis (Local), of Human Tissue A New Method for (Robert C Mellors and Kenneth G Carroll), 1090
Chemical Applications of Diffraction Methods (Bradford Institute of Technology Course on), 21
Chemical Bonding in Binary Compounds A Quantitative Theory of the Character of (Prof Edward Gorlich), 133
Chemical Engineers, Institution of Symposium on Biochemical Engineering, 119
Chemical Industry, Society of Symposium on Oxidation Processes in Chemical Manufacture, 1134
Chemical Industry, Society of (Fine Chemicals Group) Discussion on Research on the Chemotherapy of Virus Diseases, 806
Chemical Kinetics Selected Studies in (Prof Farrington Daniels), *review* by Prof J M Coulson, 297
Chemical Manufacture Oxidation Processes in (Society of Chemical Industry Symposium on), 1134
Chemical Manufacturers (British), Association of British Chemicals and their Manufacturers, 1025
Chemical Nomenclature Chemico-Linguistics—Computer Translation of (A Garfield), 192
Chemical Society Symposium on Electron Spin Resonance, 1034
Chemical Society (Faculty of History of the Worshipful Society of Apothecaries of London, in co-operation with the) Second British Congress on the History of Medicine and Pharmacy—Chemistry in the Service of Medicine, 1017
Chemical Society (Bradford), and others Symposium on Antibiotics and Newer Synthetic Drugs, 1132
Chemical Structure Biosynthesis of Carotenoids in Purple Bacteria—a Re-Evaluation based on Considerations of (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Chemical Warfare on Plant Pests and Diseases (W C Moore), 1140
Chemicals from Salt Electrolytic Manufacture of (Dr D W F Hardie), *review* by Dr M J Newlands, 902
Chemicals (Agricultural), Association of British Manufacturers of British Insecticide and Fungicide Conference, 406, 1140
Chemicals (British), and their Manufacturers (Association of British Chemical Manufacturers), 1025
Chemicals (Toxic), in Agriculture and Food Storage, 1130
Chemico-Linguistics—Computer Translation of Chemical Nomenclature (A Garfield), 192
Chemie (Organischen) Lehrbuch der (Prof Paul Karrer), 13 Auflage, *review* by K H Overton, 855
Chemist (Government) Report for 1960 (Department of Scientific and Industrial Research), 122
Chemist's Introduction to Statistics, Theory of Error and Design of Experiment (Dr D A Pantony), 213
Chemistry at the University College of Sussex, 18
Chemistry Advanced Organic (Prof G W Wheland), third edition, *review* by Dr D T Lewis, 835
  History of (Prof J R Partington), Vol 2, *correction of price*, 213
  Nobel Prize for, awarded to Prof M Calvin, 799
  Polymer, *review* by Dr I C McNeill, 490
  Polymer, *review* by Dr I C McNeil, 591
Chemistry of Enzymes in Cancer (Prof Franz Bergel), *review* by Dr L H Stickland, 100
Chemistry in Industry, *review* by Dr M J Newlands, 902
Chemistry in the Service of Medicine (Second British Congress on the History of Medicine and Pharmacy), 1017
Chemistry, Royal Institute of Atmospheric Photochemistry (Sir Harrie Massey and Dr A E Potter), 213
  A Chemist's Introduction to Statistics, Theory of Error and Design of Experiment (Dr D A Pantony), 213
  Recent Developments in Polarography (Dr G W C Milner), 213
  Meldola Medal for 1961 (Society of Maccabaeans), 309
  Summer School in Analytical Chemistry at the Manchester College of Science and Technology, 608
Chemistry (Analytical) Summer School in, at the Manchester College of Science and Technology (Royal Institute of Chemistry), 608
Chemistry (Analytical), of the Rare Earths (Dr R C Vickery), *review* by Dr D T Lewis, 593
Chemistry (Organic) An Electronic Outline of (Dr S Horwood Tucker), *review* by Dr Neville H P Smith, 7
Chemistry (Organic), of High Polymers An Introduction to the (Prof Carl S Marvel), *review* by Dr I C McNeill, 591
Chemistry (Oxidative Enzyme Histo- and Cyto-) Use of Tetrazolium Compounds in (Prof C G Rosa and Kwan-Chung Tsou) 990
Chemistry (Physical) Fast Reactions in (Dr W Gerrard), 1136
Chemistry (Polymer) Preparative Methods of (Wayne R Sorenson and Tod W Campbell), *review* by Dr I C McNeill, 490
Chemistry (School) New Thinking in (Organization for European Economic Co-operation), 404
Chemistry (Theoretical) Summer School in (University of Oxford), 609
Chemists A Statistical Model for (Edward L Bauer), *review* by Dr D T Lewis, 102
Chemotherapy of Virus Diseases Research on the (Fine Chemicals Group of the Society of Chemical Industry Discussion on), 806
Chernoff, Prof Amoz I Chromium-51 Tagging of the α-Chain of Human Haemoglobin, 327
Cheronis, N D Microchemical Techniques (Characterization of Organic Compounds at the Microgram and especially the Submicrogram Range), 411, (Contemporary Position of Small-scale Methods in the Teaching of Chemistry at the Secondary School and Collegiate Levels), 412
Cherry, Prof Colin Speech (Problems in the General Field of Speech Perception), 602
Chessick, J J, and others Surface Properties of Silver Iodide, 653
Chiarelli, Dr Brunetto Chromosomes of the Orang-Utan (*Pongo pygmaeus*), 285
Chicago Natural History Museum Fieldiana, Botany, Vol 30, No 4, Orchids of Peru (Charles Schweinfurth), 719
Chick Embryo Erythrocytes Number of Re-Circulations of (L Lemez and Z Rychter), 1298
Chick Embryos Dissecting Aneurisms of the Large Arteries of, due to (Sweet Pea) Lathyrism (Z Zahoř and M Machova), 532
  Localization of Inhibitors of Neural Differentiation in (Dr A K Katoh), 997
Chick Tibiotarsi (Embryonic), cultivated *in vitro* Effect of L-Glutamic Acid on the Weight of (Dr J D Biggers), 664
Chicken Embryo (Developing) Comparison of the Serum Protein Fractions of the, by the Technique of Starch-Gel Electrophoresis (A. Amin), 356
Chicken Tissues Persistence of Sterols other than Cholesterol in (David Kritchevsky and Vittorio Defendi), 71
Chicks Effect of Feeding Griseofulvin on Rate of Growth of (Dr W P Jaffe), 469
Chicks (Conventional and Germ-free) Serotonin in the Small Intestine of (Prof A W Phillips, H R Newcomb, J E Smith and R Lachapelle), 380
Children Ambient Temperature and Depot Fat Iodine Number in (I Macdonald), 363
  Cystine Content in Hair of, as influenced by Vitamin A and Animal Protein in the Diet (Tatsuo Koyanagi and Teru Takanohashi) 457
Children, Adults and Hypopituitary Dwarfs Growth Hormone Content of Serum in Infants, (Dr J Girard, Dr M Vest and Dr N Roth), 1051
Chimie Physique, Société de Eleventh Annual Reunion (Discussion on the Structure, Synthesis and Function of Deoxyribonucleic Acid), 24
Chimpanzee Sera Transferrin Differences in (Prof John Buettner-Janusch), 632
Chin, N K, and others Muscle Receptors (Structure, Nerve Spectra and Distribution of Spindles in Cat Muscles), 806
Chirgwin, Dr B H Electrodynamics and Mechanics, *review*, 389
Chitinase, an Addition to the List of Hydrolases in the Digestive Tract of Vertebrates (Dr Charles Jeuniaux), 135
Chitinozoa from the Ordovician Nod Glas Formation of Merioneth (Prof F H T Rhodes), 275
Chittenden, Rosemary A, and others Hydrogen Bonding in Alkyl Phosphonic and Alkyl Phosphonothionic Acids, 1283
Chiykowski, Dr L N Transmission of Clover Phyllody Virus by *Aphrodes bicinctus* (Schrank) in North America, 581
Chloral A Cyclic Tetramer of (Maximo Baron), 258
Chloride Concentration of, in Fresh Waters and Rain Water (A. V Holden), 961
Chloride Regulation in *Triops* (Gwyneth Parry), 468
Chloride (Potassium) Incorporation of Trivalent Cations in Crystalline (Dr Marian E Hills and Prof Allen B Scott), 1066
  Radio-Luminescence in Sodium Chloride and (S B Hyder and B K Gupta), 60
Chloride (Sodium), and Potassium Chloride Radio-Luminescence in (S B Hyder and B K Gupta) 60
Chloride Dihydrochloride (2,7-di-(*m*-amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium), M & B 4596 A New Prophylactic Trypanocidal Drug, (S. S. Berg, K N Brown, J Hill and W R Wragg), 367
Chlorides (Uranium) Organic Extraction from Fused (M Taube and Z Borkowska), 745
Chlorinated Hydrocarbon Insecticides Effect of, on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase (Jennifer Rothschild and Dr G F Howden) 283
Chlorine-36 and Iodine-131 (Sodium-24, Potassium-42,) Permeability of the Mammary Gland to (P -G Knutsson), 977
7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide Effects of, on Mitochondria from Rat Liver and Brain (Bernhard Kadenbach and Prof Walter Luhrs), 174
Chlorogenic Acid, an Allergen in Green Coffee Bean (Dr S Q Freedman, J Krupey and A H Sehon) 241
Chlorophyll (Water-soluble) Photochemical Properties of (Prof Gerald Oster and Suse B Broyde), 132

Chlorophyll C_2^+ (Oxidized Cytochrome and), in Photosynthesis (Dr H T Witt, A Muller and B Rumberg), 907
Chlorophyll Content Gibberellic Acid and, of Leaves of Meteor Peas (P Bishop and Prof C P Whittingham), 576
Chlorophylls Biosynthesis of Porphyrins and (Dr K D Gibson, Margaret Matthew, Prof A Neuberger and G H Tait), 204
Chloroplast Cytochromes Response of, to Light and Substrates (Prof H Lundegårdh), 243
Chlorpromazine Alteration of Permeability of *Lactobacillus plantarum* caused by (Dr Helene A Nathan), 471
Cholesterol A Perchloric Acid–Naphthoquinone Method for the Histochemical Localization of (Dr C W M Adams), 331
  Persistence of Sterols other than, in Chicken Tissues (David Kritchevsky and Vittorio Defendi), 71
Choline Acetylase (Insect), Condensing Enzyme and Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on (Jennifer Rothschild and Dr G F Howden), 283
Cholinergic Neurons in Vertebrates (Dr Catherine Hebb), 527
Cholinergic Transmission Mechanisms for both Excitation and Inhibition in Molluscan Central Synapses (Dr L Tauc and Dr H M Gerschenfeld), 366
Cholinesterase-levels (Erythrocyte), in Mental Patients (Dr George L Ellman and Dr Enoch Callaway), 1216
Chondrites (Carbonaceous) A Microbiological Examination of some (Dr George Claus and Prof Bartholomew Nagy), 594
Chowdhury, Dr K A, and Ghosh, S S Indian Woods, Vol 1, Dilleniaceae to Elaeocarpaneae, *review* by Dr C R Metcalfe, 1110
Christians Evolution and (Dr Philip G Fothergill), *review* by the Rev Charles E Raven, 827
Christmas Lectures at the Royal Institution, 1026
Christmas Lectures at the Royal Society of Medicine, 1026
Christy, Dr N P, and others Effect of Aldosterone on the Living Cornea *in vitro*, 73
Chromatid Aberrations Production of, by Diepoxybutane and an Iron Chelator (Prof Norman S Cohn), 1093
Chromatin (Nuclear) Primary Embryonal Sex Ratio in Normal Pregnancies determined by the (Prof F E Szontagh, A Jakobovits and Ch Méhes), 476
Chromatograms (Paper) Improved Benzedrine Sugar Reagent for (Bock G Chan and Prof J C Cain), 69
Chromatographic Purity Use of Pherol in determining (B H Koeppen), 360
Chromatographic Spots (Paper) Combustion Analysis of (H Soep), 67
Chromatographic Sub-fractionation of Human 7S γ-Globulin Serological Evidence of a (Ulf Nilsson), 1301
Chromatographical Separation of Carbohydrate O-Isopropylidene Derivatives (J E G Barnett and Dr P W Kent), 556
Chromatographie (Papier-) Handbuch der (herausgegeben von I M Hais und K Macek), Band 2, Bibliographie und Anwendungen, *review* by Dr R Consden, 1223
Chromatography (Gas) Detection by Ionization of Gases in Helium used in (W A Wiseman), 964
  Pyrolysis and, for the Detection of the Benzene Ring in Organic Compounds (J H Dhont), 747
Chromatography (Gas), of Androst-16-en-3α-ol and related Steroids (R W R Baker and Dr D B Gower), 1074
Chromatography (Gas), in Medical Research (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 717
Chromatography (Gas), of Unesterified Fatty Acids Improved (P Jowett and B J Horrocks), 966
Chromatography (Gas-Liquid) Partition Isotherms and (G F Freeguard and R Stock), 257
  Quantitative Estimation of Peak Areas in (J Dijkstra), 965 , (Prof K K Carroll), 965
Chromatography (Gas–Liquid), of Steroids Group Retention Factors in the (R B Clayton), 524
Chromatography (Ion-Exchange) Determination of Argininosuccinic Acid by (D C Cusworth and R G Westall), 555
  Effect of Charcoal on the Behaviour of Adenine Nucleotides in (U Pethiyagoda), 452
Chromatography (Self-Displacement), at Low Temperatures Purification of Hydrogen Isotopes by (Dr T R Phillips, D R Owens and A G Hamlin), 1067
Chromatography (Substractive Gas) Behaviour of 5A Molecular Sieve in (E R Adlard and B T Whitham), 966
Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet (T Hudnik-Plevnik and Dr L A Stocken), 554
Chrome-Urania System, $Cr_2O_3 2UO_3$ X-Ray Data for the (Deane K Smith, Carl F Cline and Donald E Sands), 861
Chromic Ions in the Corundum Lattice Ligand Field for (Dr J Graham and Dr D E Scaife), 161
Chromium-51 Tagging of the α-Chain of Human Haemoglobin (Prof Amoz I Chernoff), 327
Chromosomal Aberrations induced by an Animal Virus (Dr Berge Hampar and Dr Solon A Ellison), 145
Chromosomal Lesion associated with Carcinogen-induced Tumours in Mice (June Lee Biedler, Lloyd J Old and Dr Donald A Clarke), 286
Chromosome Complements of New-born and Adult Living Mice Identification of the (R G Edwards), 1316
Chromosome Preparation from Fresh and Cultured Tissues using a Modification of the Drying Technique (M Fox and Dr I M Zeiss), 1213
Chromosome Preparations obtained directly from Peripheral Blood (M A Kinlough and Prof H N Robson), 684
Chromosomes of the Orang-Utan (*Pongo pygmaeus*), (Dr Brunetto Chiarelli), 285
Chromosomes (Somatic), of the Gorilla (J L Hamerton, M Fraccaro, L de Carli, Fiorella Nuzzo, H P Klinger, Lotte Hulliger, Angela Taylor and E M Lang), 225
Chronic Hepatic Injury Nature of Increased Protein and DNA in (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and Hans Popper), 886
Chronic Obstruction of the Rabbit Appendix Morphological Changes following Transplantation and (J A Williams, W O Griffen, jun, and A Sharma), 867
Chuan, R L Astronautics (Laboratory Facilities and Techniques for Rarefield Gasdynamics Research), 311
Churchill College, Cambridge Election of J A Pateman and C K Phillips to Fellowships, 710
  Election of J S Gibson to a Junior Research Fellowship, 710
  Election of Prof Jacques Barzum and Prof Kenneth J Arrow to Extraordinary Fellowships, 710
  Election of Dr P W Anderson to an Overseas Fellowship, 710
Chymotrypsin Peptides released by Digestion with (Amino-Acid Sequence of Horse Heart Cytochrome c), (Dr E Margoliash and Prof Emil L Smith), 1121
Chymotrypsin-like Esterases Histochemical Examinations of (Dr David Lagunoff and Prof Earl P Benditt), 1198
Ciba Lectures in Microbial Biochemistry, 1959 Synthesis and Organisation in the Bacterial Cell (Dr E F Gale), *review* by Dr S Dagley, 489
Cigarette Smoke Amounts of Oxides of Nitrogen and Carbon Monoxide in, with and without Inhalation (C Bokhoven and H J Niessen), 458
Circular Streaming Patterns in a Slime-Mould Plasmodium (Dr Peter A Stewart and Dr Babette T Stewart) 1206
Circulating Antibodies in the Milk of the Rat Selective Secretion of (E Ruth I Biswas), 883
Circulation (Enterohepatic), of Bilirubin (Roger Lester, J Donald Ostrow and Prof Rudi Schmid), 372
Circulation (Winds and), in the Upper Atmosphere (Royal Meteorological Society Symposium on), 12
Circulatory Failure Reserpine-induced (Prof Eleanor Zaimis), 521
Circulatory Homeostasis (Foetal) Sensory Deprivation and (Prof S R M Reynolds), 818
Cirrhosis (Liver) Auto-Immunization and (Dr W Mori and Dr T Suzuta), 41
Citrate (Dietary), and Hypomagnesaemia in the Ruminant (A W A Burt and D C Thomas), 1193
City and Guilds College (Imperial College of Science and Technology, London) Research Report 1958-61, 802
City and Guilds of London Institute Licentiateships in Printing and Furniture, 920
Civil Servants (Professional), in Britain, 1003
Civil Service Morale in the—a Study of the Desk Worker (Nigel Walker), 1003
Clapp, Verner, W At the twenty-seventh Conference of the International Federation for Documentation (Important Progress in Documentation in the United States), 219
Clark, Prof George L (edited by) The Encyclopedia of Microscopy, *review* by Dr R Barer, 833
Clark, Dr L G, and others Natural Occurrence of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the Eastern Raccoon, 1312
Clark, Peggy Effect of Hydrocortisone on Uptake of Iron-59 in Incubated Rat Red Cells *in vitro*, 667
Clark, Dr R J H, and others Eight-Co-ordinate Diarsine Complexes of Quadrivalent Metal Halides, 222
Clark, Sir Wilfrid Le Gros Awarded a Royal Medal for 1961 of the Royal Society, 707, 906 , work of, 906
Clarke, Arthur C At the Twelfth International Astronautical Congress (The Social Impact of Communications Satellites), 1244
Clarke, Brenda (Tager, J M, and) Replacement of an Alternating Temperature Requirement for Germination by Gibberellic Acid, 83
Clarke, Dr C A Molecular Biology and Population Structure, 414
Clarke, Dr Donald A, and others Chromosomal Lesion associated with Carcinogen-induced Tumours in Mice, 286
Clarkson, Dr R, and Martin, Dr A R 4-Sulphanilamido-6-Methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,536)—Two New Long-acting Sulphonamides, 523
Clarricoats, Dr P J B Microwave Measurement Techniques (Power Meaurement), 409 , (Simple Wave-guide Method for the Determination of the Permittivity of Cylindrical Dielectric Rods), 410
Clasen, W E (compiled and arranged on an English alphabetical base by) Elsevier's Dictionary of Automation, Computers, Control and Measuring, in Six Languages, English/American, French, Spanish, Italian, Dutch and German, *review* by S Whelan, 904
Classical Oscillators Fundamental Relaxation of (Michael Hoare), 63
Classification of Fossil Microplankton (Dr C Downie, G L Williams and Dr W A S Sarjeant), 471
Claus, Dr George, and Nagy, Prof Bartholomew A Microbiological Examination of some Carbonaceous Chondrites, 594
Clauser, H, and others Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extra-cellulose Glucose, 166
Claviceps paspali Stevens and Hall Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Clay (Kaolinite-Hydrous Mica–Quartz) Moisture Expansion Relationships for a Fired (Dr W F Cole), 737
Clay (Kaolinitic) Puzzolanic Activity and Semiconductivity of Fired Kaolin and (A K Chatterji), 1180
Clay (Red), on the Floor of the Atlantic Natural Glass from beneath (Dr G D Nicholls and V T Bowen), 156
Clayton, C G, and others Dependence of Thermo-stimulated Current Curves on Heating Rate, 349
Clayton, R B Group Retention Factors in the Gas–Liquid Chromatography of Steroids, 524
Clayton, W D Woody Plants of Ghana with special reference to their Uses, *review*, 695
Clegg, James S, and Filosa, Michael F Trehalose in the Cellular Slime Mould *Dictyostelium mucoroides*, 1077
Cleverdon, C W At the twenty-seventh Conference of the International Federation for Documentation (Work of the Aslib Cranfield Investigation into the Efficiency of Indexing Systems), 219
Clews, Prof C J B, and others X-Ray and Neutron Diffraction Examinations of *p*-Diphenylbenzene, 154
Clezy, P S Detection of Carboxyl Groups in Conjugation with the Porphyrin Ring System, 750
Clifford (Stanley) Milk Industry Award (Society of Dairy Technology), 213
Climate Changes of (Unesco and the World Meteorological Organization Symposium on), 1139
  Effects of, on Vegetation, *review* by Prof G Manley, 5

Climates of the Past, *review* by Prof F W Shotton, 828
Climatologie Précis de (Prof Ch P Péguy), *review* by Prof W B Fisher, 1223
Clinch, Dr Phyllis M Appointed to the chair of botany in University College, Dublin, 1238 , work of, 1238
Cline, Carl F , and others X-Ray Data for the Chrome-Urania System, Cr_2O_3 $2UO_3$, 861
Clinical Biochemists, Association of Election of Officers, 309
Clinical Research Senior Research Fellowships in (Wellcome Trust), 1026
Clinico-Pathological Entity Establishment of Amoebic Hepatitis as a Distinct (Prof Th Doxiadis and Prof N Candreviotis), 988
Clinton, A Cadman Developments in Astronautics, 310
Closely Related Antigens in Human Placenta and Kidney (Dr Raymond William Steblay), 1259
Clover (White) Effect of Copper Deficiency in, on Nitrogen Fixation (F H van der Elst, K J McNaught and W F Rolt), 1315
Clover Phyllody Virus Transmission of, by *Aphrodes bicinctus* (Schrank) in North America (Dr L N Chiykowski), 581
Clover Seeds Survival of *Rhizobium* on (J F Loneragan, D V Moye and A J Anderson), 526
Clowes, Dr F A L Apical Meristems, *review* by Dr A Allsopp, 830
Clowes, Dr M B , and Parks, J R At the twenty-seventh Conference of the International Federation for Documentation (A Device for the Automatic Identification of Printed Numerals), 219
Clunie, Dr J Appointed to a readership in mathematical analysis at the Imperial College of Science and Technology, London, 507
Coagulant Action of Phospholipids A Correlation between Surface Charge and (Dr A D Bangham), 1197
Coal Biologically Active Materials in (Martin H Rogoff and Irvine Wender), 378
Coal Fines Low Temperature Carbonization of Non-caking Coals and Briquetting of (Regional Research Laboratory, Hyderabad, Symposium on), 406
Coal Science Fourth International Conference on (Dr I G C Dryden), 116
Coals (Bituminous) Carbonyl Content of the Vitrain Component of (Dr K Littlewood and M T Monaghan), 128
Coals (Non-caking) Low Temperature Carbonization of, and Briquetting of Coal Fines (Regional Research Laboratory, Hyderabad, Symposium on), 406
Coastal Waters of the British Isles Sea Surface Temperature in (F E Lumb), 153
Coates, Joan, and others Riboflavin and Liver Sulphydryl-Levels in Mice, 164
Coates, Dr M E Nutrition and Poultry, 615
Coating with Antifouling Properties from the Reaction between Cuprous Oxide and Sodium Silicate (J R Rischbieth and F Marson), 748
Cobalt Complexes of Proteins and Polypeptides (Dr Jake Bello and Helene R Bello), 1184
Cobalt (II) Histidine Complex Structure of the Oxygen-carrying (A Earnshaw and L F Larkworthy), 1068
Coccidian Protozoa (Gregarine and) Periodic Acid–Schiff Technique for the Demonstration of Extra- and Intra-cellular Stages of (Dr J B Jennings), 473
Cockroach Lipase Activity in the Slow- and Fast-contracting Leg Muscles of the (Prof J C George and N M G Bhakthan), 356
Cocoa (D H Urquhart), second edition, *review*, 592
  Probable Mechanism of Resistance of Varieties of, to Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl (Dr John A Spence), 278
  A New Standard Work on, *review*, 592
Coconut Palm (Dwarf) Cytology and Origin of the (Dr M S Swaminathan and M C Nambiar), 85
Code (Genetic), for Proteins General Nature of the (Dr F H C Crick, Leslie Barnett, Dr S Brenner and Dr R J Watts-Tobin), 1227
Coenzyme (5,6-Dimethylbenzimidazolylcobamide) Structure of the (Dr P Galen Lenhert and Dorothy Crowfoot Hodgkin), 937
Coetzee, Prof J N (de Klerk, H C , and) Antibiosis among Lactobacilli, 340
Coffee Bean (Green) Chlorogenic Acid, an Allergen in (Dr S O Freedman, J Krupey and A H Sehon), 241
Cohen, A J Megashatter Cone Hypothesis of the Origin of Lunar Volcanoes, 346
Cohen, E Thermionic Generation of Electricity, 612
Cohen, J (Veis, A , and Anesey, J , with) At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Production of Gelatin Fractions from Skin Collagens, and their Re-Constitution as Fibres), 613
Cohen, Dr M At the First British Insecticide and Fungicide Conference (Translation of Research into Practice in Great Britain), 1141
Cohen, Richard B (Baloch, jun , Dr Karoly, and) Histochemical Localization of Uridine Diphosphoglucose Dehydrogenase in Cartilage, 1199
Cohen Dr S , and others Gamma-Globulin and Acquired Immunity to Human Malaria, 733
Cohen, S S Structure, Synthesis and Function of Deoxyribonucleic Acid (Enzyme Synthesis of DNA), 25
Cohen-Bazire, Dr Germaine, and others Biosynthesis of Carotenoids in Purple Bacteria—a Re-Evaluation based on Considerations of Chemical Structure, 1168
Coherence Mode Characteristics and, in Optical Ruby Masers (Dr I D Abella and Dr C H Townes), 957
Cohn, Prof Norman S Production of Chromatid Aberrations by Diepoxybutane and an Iron Chelator, 1093
Coils Inductance, *review* by Prof A H M Arnold, 845
Coils (Inductance) The Theory and Design of (Dr V G Welsby), second edition, *review* by Prof A H M Arnold, 845
Coincidence of the Explosive Phase of Solar Flares with 10 7-cm Solar Noise Bursts (Arthur E Covington and Gladys A Harvey), 152
Coir, its Extraction, Properties and Uses (Indian Council of Scientific and Industrial Research), *review*, 1007
Colchicine Effect of, on Rat Liver Xanthine Oxidase (Dr Ottilio R Affonso, Emilio Mitidieri and Gilberto G Villela), 666
Colclough, Dr T P *Obituary* by Prof C R Tottle, 706
Cold Crucible for High-Temperature Melting Processes (H F Sterling and R W. Warren), 745
Cole, L J N Comparative Effects of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from Fresh, Frozen and Freeze-dried Beef, 1288
Cole, Dr W F Moisture Expansion Relationships for a Fired Kaolinite-Hydrous Mica–Quartz Clay, 737
Coleoptile (*Avena*) Effect of Indole-3-Acetic Acid (IAA) on Phosphorus Metabolism in the (A Sen Gupta and S P Sen), 1291
Coleridge, J C G Appointed reader in physiology at the Royal Free Hospital School of Medicine, London, 1132
Coleus rhenaltianus Growth-stimulating Activity of *Trans*-Caffeic Acid isolated from (Dr J C Vendrig and K Buffel), 276
Colicine Receptors Nature of (Dr Anna Mayr-Harting), 191
Collagen (Soluble), in Bone (S Araya, Dr S Saito, S Nakanishi and Y Kawanishi), 758
Collagenase A Simplified Culture Medium for the Production of (Dr G H Warren and Jane Gray), 755
Collard, Prof P J Appointed professor of bacteriology and director of the Department of Bacteriology in the University of Manchester, 406
Collecting the Nematode *Panagrellus redivivus* A Chamber for Culturing and (E J Winkler and Prof David Pramer), 472
Collecting Tubules (Renal) Antidiuretic Hormone and (Paul Breddy, Grahame F Cooper and Dr Jeffrey M N Boss), 76
College of Aeronautics, Cranfield Appointment of Dr R L Apps as lecturer in the Department of Materials, 406
  Appointment of A G Simms as lecturer in the Department of Production and Industrial Administration, 406
  Appointment of J W Mair as Research Fellow in the Department of Materials, 406
  Appointment of Dr A Younger as Research Fellow in the Department of Materials 406
College of Physicians of Philadelphia Alvarenga Prize awarded to Prof Seymour S Kety, 21
College of Science and Technology (Manchester) Summer School in Analytical Chemistry (organized by the Royal Institute of Chemistry), 608
  Course of lectures in the Department of Municipal Engineering on Problems of Radioactivity at Water and Sewage Works, 609
  Annual Report for 1960-61, 922
College of Technology (Liverpool) Admitted to affiliation with the University of Liverpool, for a period of three years, 406
College of Technology (Loughborough) Appointment of Dr G F. Reynolds as reader in analytical chemistry, 115
Colleges (Universities and), in receipt of Treasury Grant, Academic Year 1959-1960 Report from (University Grants Committee), 617, 786
Colleges and Schools (Technical), in Britain Number of, 708
Collins, M A Quantitative Biology (Electron-Spin-Resonance Spectrometer), 25
Collison, I , and Scott, T At the Third Australian Spectroscopy Conference (Calibration of an A R L 'Quantovac' for the Analysis of Sulphur and Phosphorus in Carbon and Low Alloy Steels), 928
Colloids (Faraday Society Informal Discussion on), 929
Colonial Development Corporation Annual Report for 1960, 312
Colonial Development and Welfare Acts Return of Schemes made and of Loans approved (1960-1961), 313
Colour and Density of Light and Broiler Performance (C G Payne), 769
Columbia-Presbyterian Medical Center, New York Grant of 50,000 dollars from the Wellcome Trust, to provide a five-year Senior Wellcome Research Fellowship for Dr Karlis Adamsons, 212
Column Fractionation Large-Scale Polymer (Manfred J R Cantow, Roger S Porter and Julian F Verster), 752
Colville, Kenneth I (Norton, Stata, and) Antagonism of Reserpine by Intraventricular Bretylium, 72
Combustion (Hydrocarbon) Inhibition of the Formation of 3,4-Benzpyrene during (R Long and S K Ray), 353
Combustion Analysis of Paper Chromatographic Spots (H Soep), 67
Combustion Processes Gas Sampling and Chemical Analysis in (Prof G Tiné), *review* by Dr C F Cullis, 1108
Combustion Products Sampling and Analysis of, *review* by Dr C F Cullis, 1108
Commercial and Industrial Education, British Association for Election of Sir Willis Jackson as president, 115
  Annual Conference (Education and Training on the Continent of Europe), 718
  Report on Education and Training in France, 920
Committee of Public Accounts Third Report, Session 1960-61, 691
Common Dogfish An Intra-Pericardial Hepatic Intrusion in the (Dr A S Fuller), 280
Common Market and the United Kingdom (Westminster Bank, Ltd), 801
Commons, House of Second reading of the Education Bill, 800
  Debate on the Control of Government Expenditure on Research and Development, 1239
Commonwealth of Australia Scientific and Industrial Research Organization Rural Research in the C S I R O , No 36, Diet of Sheep (G W Arnold), 113
  Research Review for 1959-60, 307
  Annual Report of the Division of Electrotechnology, 608
  Division of Food Preservation—New Laboratories, 699
  Wool Research Colloquium No I, Wool Structure, 709
  Thirteenth Annual Report (1960-61), 712
  Annual Report for 1960-61 of the Dairy Section, 1131
Commonwealth (Universities of the) Appointment of delegates to the Ninth Quinquennial Congress of (Association of Universities of the British Commonwealth), 115
Commonwealth (British), Association of Universities of the Appointment of delegates to the Ninth Quinquennial Congress of Universities of the Commonwealth, 115
  Appointment of Sir Douglas Logan as vice-chairman, 922
Commonwealth Agricultural Bureaux Appointment of Dr V Armstrong as chairman, 507
Commonwealth Forestry Institute Imperial Forestry Institute, Oxford, re-named the, 802
Commonwealth Scholarship Commission First Annual Report (1959-60), 1130
Communicable Disease Control The Role of Immunization in (United Nations, World Health Organization, Public Health Papers No 8), 20

Communication (Interstellar and Interplanetary), by Optical Masers (Dr Peter van de Kamp), 348 , (Prof Charles H Townes and Dr Robert N Schwartz), 348
Communication (Long-Range Radio), by Satellite Microwave Dipoles, 109
Community The Scientist and the, 195
Community (English) Diabetes in an (Dr Joan B Walker and David Kerridge), *review*, 391
Commutative Algebra (Prof Oscar Zariski and Prof Pierre Samuel), Vol 2, *review* by Prof L S Goddard, 855
Comparative *in vitro* Activities of Phosphorylase *b* and Cytochrome Oxidase in Preparations from Two Ox Muscles (E J Briskey and R A Lawrie) 263
Comparative Effects of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from Fresh, Frozen and Freeze-dried Beef (L J N Cole), 1288
Comparative Effects of Wet and Dry Feeding on the Utilization of Protein by Calves (A M Raven and K L Robinson), 1256
Comparative Zoology (Museum of), Harvard College 101st Annual Report (1959-60), 405
Comparison of Charcoal and 'Sephadex' Purification of Fluorescent Protein Conjugates— (Dr, J E Fothergill and Dr R C Nairn), 1073
Comparison of the Mitochondria of the Small Intestine of Vertebrates (P J Stanbury) 67
Comparison with Radioxenon Tracer Loss of Fluorescent Particles in Atmospheric Diffusion Experiments by (A E J Eggleton and N Thompson), 935
Comparison of the Serum Protein Fractions of the Developing Chicken Embryo by the Technique of Starch-Gel Electrophoresis (A Amin), 356
Comparison of Transduction versus Transformation of Linked Markers in *Bacillus subtilis* (Erela Ephrati-Elizur and Maurice S Fox), 433
Complement-fixing Antibodies to Human Growth Hormone and Sheep Interstitial Cell Stimulating Hormone (Allen Trenkle N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Complements (Chromosome), of New-born and Adult Living Mice Identification of the (R G Edwards), 1316
Complete Amino-Acid Sequence (Amino-Acid Sequence of Horse Heart Cytochrome c) (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy) 1125
Complex of D-Amino-Acid Oxidase and 'Substrate-Substitute' Crystallization of the (Kunio Yagi and Takayuki Ozawa), 70
Complex (Oxygen-carrying Cobalt (II) Histidine) Structure of the (A Earnshaw and L F Larkworthy), 1068
Complex Argument Table of Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\ dt\right)$$

for (V N Faddayeva and N M Terent'ev), edited by V A Fok (translated from the Russian by D G Fry), *review* by Prof C A Coulson, 97
Complex Variable Lectures on the Theory of Functions of a (Prof G Sansone and Dr Johan Gerretsen), Vol I, Holomorphic Functions, *review* by Prof W K Hayman, 694
Complexes (Cobalt), of Proteins and Polypeptides (Dr Jake Bello and Helene R Bello), 1184
Complexes (Copper) Properties of some—Five-Covalent Copper (II) Complexes containing 1,10-Phenanthroline and 2 2'-Bipyridyl (Dr C M Harris, T N Lockyer and Hanneke Waterman), 424 , The Trigonal-Bipyramidal Configuration of the Iodo *Bis* (2-2'-Bipyridyl) Copper (II) Ion, 425
Complexes (Eight-Co-ordinate Diarsine), of Quadrivalent Metal Halides (Dr R J H Clark, Dr Jack Lewis Prof R S Nyholm, Dr Peter Pauling and Dr G B Robertson), 222
Complexes (Five-Covalent Copper(II)) containing 1,10-Phenanthroline and 2,2'-Bipyridyl (Properties of some Copper Complexes), (Dr C M Harris T N Lockyer and Hanneke Waterman), 424
Complexes (Transition-Metal) Cation Toxicity and the Stability of (Dr William H R Shaw), 754
Component of the Total Potential of the Soil Water Importance of Osmotic Potential as a, on the Movement of Nematodes (C D Blake), 144
Component (Deoxyribonucleic Acid) Crystallization of Cytochrome b_2 Free of the (Prof R K Morton and Kathryn Shepley), 639
Component (A Subcellular), of *Corynebacterium diphtheriae* having the Capacity to Bind Anti-Toxin (Prof M Yoneda and M Matsuda) 642
Component (An Unusual Major Fatty Acid), in Human Depot Fat (Dr D S McLaren and W W C Read), 265
Component (Vitrain), of Bituminous Coals Carbonyl Content of the (Dr K Littlewood and M T Monaghan), 128
Components (Analog Computer) Design Fundamentals of (Prof R M Howe), *review* by Dr M V Wilkes, 489
Components (*Gc*) (Group-specific), in the Sera of Native Africans Distribution of (Dr Jan Hirschfeld and Jean Sonnet), 766
Components (Nucleic Acid and Protein) Dissociation of Foot-and-Mouth Disease Virus into its (F Brown and B Cartwright), 1163
Composition Catch-rates and (Trawl Fishing in the Tropical Atlantic), (R H Lowe (McConnell) and Alan R Longhurst), 620
Composition (Amino-Acid), of Bovine Growth Hormone Determination of the (Dr Alan J Parcells) 971
Composition (Amino-Acid), of the Polypeptide Chains of Gorilla Haemoglobin (Emile Zuckerkandl and W A Schroeder) 984
Composition (Isotopic), of Atmospheric Hydrogen and Methane (A E Bainbridge, Prof H E. Suess and Irving Friedman), 648 , (K F Bishop, R T Taylor and A E J Eggleton), 649
Compositions A New Reversible Solid-State Transformation in Iron–Nickel Alloys in the Invar Range of (Prof N I Ananthanarayanan and R J Peavley) 962
Compound (Carbon-Functional Organic Silicon), Dimethyldi-(4-hydroxyphenyl)-silane Allergy to a (Dr Sigfrid Fregert and Dr Hans Rorsman), 989
Compounds Isolation of Radioactive Bismuth from Metallic Lead and its (J R W Kerr, Dr D I Coomber and Dr D T Lewis), 546
Compounds (Binary) A Quantitative Theory of the Character of Chemical Bonding in (Prof Edward Gorlich), 133
Compounds (Carbonyl) Role of Keto-Enol Tautomerism in the Polarographical Reduction of some (Dr P Zuman and Dr J Michl), 655
Compounds (Diphenyl) Evaluation of the Activity of some, on Winter Eggs of the Fruit Tree Red Spider (J Meltzer), 474
Compounds (Organic) Pyrolysis and Gas Chromatography for the Detection of the Benzene Ring in (J H Dhont), 747
Compounds (Plant Growth) Effect of, on Uptake of Amino-Acids by Plant Roots (D E Wright), 1044
Compounds (Tetrazolium) Use of, in Oxidative Enzyme Histo- and Cyto-Chemistry (Prof C G Rosa and Kwan-Chung Tsou), 990
Computation (Digital), at King's College, Newcastle-upon-Tyne, 708
Computer High-speed Digital (Programmed Data Processor) given to the Massachusetts Institute of Technology by the Digital Equipment Corporation, Maynard, Mass , 922
Computer Design, *review* by Dr M V Wilkes, 489
Computer Languages Artificial (British Association for the Advancement of Science, Section A* (Mathematics), Symposium on), 22
Computer Logic—the Functional Design of Digital Computers (Dr Ivan Flores) *review* by Dr M V Wilkes, 489
Computer *Pascal* Digital (*Philips Technical Review*, Vol 23, No 1, 1025
Computer Translation of Chemical Nomenclature Chemico-Linguistics—(A Garfield), 192
Computer (Analog) Components Design Fundamentals of (Prof R M Howe) *review* by Dr M V Wilkes, 489
Computers, Control and Measuring (Automation,) Elsevier's Dictionary of, in Six Languages, English/American, French, Spanish Italian, Dutch and German (compiled and arranged on an English alphabetical Base by W E Clason), *review* by S Whelan, 904
Computing Up to Date, *review* by Dr R A Buckingham, 202
Computing Machines Universal Language for (Dr D A Booth), 22
Computing Methods Modern (National Physical Laboratory, Notes on Applied Science, No 16), second edition (Department of Scientific and Industrial Research), *review* by Dr R A Buckingham, 202
Concentrates (Extracellular), of Group *A* Streptococci Esterase in and the Homologous Antibody (Extracellular Esterase of Group *A* Streptococci), (Aaron H Stock José Uriel and Pierre Grabar), 434
Concentration of Chloride in Fresh Waters and Rain Water (A V Holden), 961
Concentration of Dye-Protein Conjugates by Gel Filtration Purification and (Dr W George and Dr K W Walton), 1188
Concentration of Inhaled Cerium-144 in Pulmonary Lymph Nodes of Human Beings (K Liebscher, Dr T Schonfeld and A Schaller), 1308
Concentration of Ribonucleic Acid during Wound Tissue Regeneration Changes in the (Martin B Williamson and Wilhelm Guschlbauer), 454
Concentration Effects (Stress), in Tertiary Creep (Dr P W Davies and B Wiltshire), 1281
Concentrations (High and Physiological Salt) Antigen–Antibody Precipitation contrasted in Gels of (Dr Alfred J Crowle and David C Lueker), 50
Concentrations (Red Blood Cell Potassium) Medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep Relationships between (Prof J V Evans) 567
Concept of Dormancy in the Bacterial Endospore Dipicolinic Acid Content Heat-Activation and the (A. Keynan, W G Murrell and Prof H O Halvorson), 1211
Conceptual Advances in Immunology and Oncology (University of Texas Sixteenth Annual Symposium on Fundamental Cancer Research), 1132
Concomitant Cytopathic Effect Serial Propagation of Types 1, 2, 3 and 4 Dengue Virus in HeLa Cells with (Sonja M Buckley), 778
Concrete Structural (Prof Kurt Billig), *review* by Prof A W Hendry, 7
Condensed Phosphates (Inorganic) Protection by against the Lethal Effects of X-Rays (J H Barnes and J St L Philpot), 574
Condensing Enzyme and Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, (Jennifer Rothschild and Dr G F Howden), 283
Condition (Hollow Fruit) of Tomatoes Influence of Tomato Mosaic Virus Infection on the (D J Harrison), 90
Conditions of Culture Œstrogen Content of Plants as a Function of (Prof R Ferrando, M M Guilleux and A Guerrillot-Vinet), 1205
Conditions (Dissociating), in Acid Solution Sedimentation of β-Lactoglobulin (*A B*) under (Lilo M Gilbert and Dr G A Gilbert) 1181
Conditions (Physical), as Important Factors for the Regeneration of Naked Yeast Protoplasts (Dr O Nečas) 580
Conductance (Membrane), of Rabbit Ventricular Fibres Evidence for Independence of Voltage of the (Dr Edward A Johnson and J Tille), 663
Conduction (Nervous) Action of Methyl Hydroxybenzoate on (Dr P W Nathan and T A Sears) 668
Conductivity (Electrical), of Calcium Oxide at High Electric Fields (Dr C H B Mee), 350
Conductivity (Soil Hydraulic) Method of measuring, *in situ* (Prof J N Luthin), 383
Cone Hypothesis (Megashatter), of the Origin of Lunar Volcanoes (A J Cohen), 346
Configuration (The Trigonal-Bipyramidal) of the Iodo *Bis*(2-2'-Bipyridyl Copper(II) Ion (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard) 425
Confirmation of Outer Atmospheric Asymmetry postulated to explain the False Zodiacal Light (E R Hope), 742
Confluent Hypergeometric Functions (Special) for Asymptotic Solutions of Differential Equations of the Second Order Tables of Airy Functions and (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Conformations (Structures and), of some Naturally Occurring Derivatives of Proline (R J Abraham, K A McLauchlan Shirley Dalby, Prof G W Kenner, R C Sheppard and L F Burroughs), 1150
Conjugate Point Experiment Stanford–Pacific Naval Laboratory (J E Lokken J A Shand, Sir C S Wright, L H Martin, N M Brice and R A Helliwell), 319
Conjugated Bilirubin Electrophoretic Separation of, on Paper (Dr E Talafant) 972
Conjugated Œstrogens (Urinary) Purification of, by Gel Filtration (C G Beling), 326

Conjugates (Biliary), of 3,4-Benzpyrene Enzymatic Hydrolysis of, on Filter Paper (Dr Hans L Falk, Sung Suk Lee and Prof Paul Kotin), 973
Conjugates (Dye-Protein) Purification and Concentration of, by Gel Filtration (Dr W George and Dr K W Walton), 1188
Conjugates (Fluorescent Protein) Purification of—Comparison of Charcoal and 'Sephadex' (Dr J E Fothergill and Dr R C Nairn), 1073
Conjugation with the Porphyrin Ring System Detection of Carboxyl Groups in (P S Clezy), 750
Conn, Prof G K T The Norman Lockyer Observatory, 108
Connective Tissue and Intestine Alterations in, produced by Hypervitaminosis A in *Xenopus laevis* (Gerald Weissmann), 235
Conquest of Hunger (Dr W R Aykroyd), 417
Consden, Dr R Handbuch der Papierchromatographie, *review*, 1223
Consequence Trees of, *review* by T A Russell, 488
Conservation of the Biological Activity of a Soluble Ribonucleic Acid (J H Weil, Prof J P Ebel and R Monier) 169
Consiglio Nazionale della Ricerche Monografie Matematiche, 7, Lectures on Modern Geometry (Prof Beniamino Segre), *review* by L Roth, 847
Constant (Rate), and Activation Energy in Solid State Reactions Definition of (W Gomes), 865
Constituent of Phosphoproteins from Plasma of the Laying Hen Phosphorylserine as a (P J Heald), 455
Consumption and Expenditure (Domestic Food), 1959—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 317
Contact between Rabbits Transmission of Lapinized Rinderpest Virus by (Dr G R Scott and C S Rampton), 289
Contact Stresses and Friction Effective (Dr D H Trollope), (July 22 376), *errata*, 213
Contagious Pustular Dermatitis Virus Growth of, in Human Tissue Cultures (Prof A Macdonald and T M Bell), 91
Contarinia sorghicola (Coq), (Sorghum Midge), in West Africa (K M Harris), 187
Continental Medieval Glazed Pottery A Spectroscopic Survey of English and (L C Thomas and J W G Musty), 1143
Continental and Oceanic Differentiation (Prof J D Bernal), 123, 125 , (Dr Robert S Dietz), 124 , (Prof J Tuzo Wilson), 125
Continua Angular Momentum of (Prof J S Dahler and Prof L E Scriven), 36
Continuous Culture of Micro-organisms (Czechoslovak Academy of Science Second International Symposium on), 213
Continuous Magnetic Fields (Very High,) Advances in the Generation and Use of (Dr Henry H Kolm), 299
Continuous Media Electrodynamics of (L D Landau and E M Lifshitz), translated from the Russian by J B Sykes and J S Bell, *review* by Dr B H Chirgwin, 389
Contraction 'Glycerol Effect' and the Mechanism linking Excitation of the Plasma Membrane with (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
Contraction–Relaxation Extendability of Tendons undergoing (Dr H R Elden and G Webb), 742
Contrera, J F (Goldstein, Prof M , and) Inhibition of Dopamine *β* Oxidase by Adrenalone, 1081
Contribution of Electron Microscopy to Polymer Morphology (Electron Microscope Society of America Symposium on), 610
Contributions of the Czechoslovak Science and Arts to World Culture (Czechoslovak Society of Arts and Sciences in America Symposium on), 309
Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling (edited by Ingram Olkin, S G Ghurye, Wassily Hoeffding, William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
Contributions to the Systematics of Oriental Termites (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Control of the Army Worm on Grazing in Kenya (J A Bullock and D C Bond), 480
Control of Government Expenditure on Research, 485
Control of Government Expenditure on Research and Development (House of Commons Debate on), 1239
Control in Industrial Application Radiation—Use and (Dr Charles Wesley Shilling), *review* by B E Jones, 855
Control of Mitochondrial Pathways Transamination and the (Dr H Gutfreund, Dr K E Ebner and L Mendiola), 820
Control of Public Expenditure 485
Control and Measuring (Automation, Computers) Elsevier's Dictionary of in Six Languages, English/American, French, Spanish, Italian, Dutch and German (compiled and arranged on an English alphabetical base by W E Clasen), *review* by S Whelan 904
Control (Communicable Disease) The Role of Immunization in (United Nations, World Health Organization Public Health Papers No 8), 20
Control (Hormonal), of the Development of the Thymus of the Foetal Rabbit (J G Bearn), 875
Control (Hormonal), of Oxidized Flavour in Milk (Harald Astrup), 559
Control (Infestation), in Stored Food-Grains Pre-Harvest Prophylaxis for (S K Majumder, K Krishnamurthy and S Godavari Bai), 375
Control (Pharmaceutical) in Britain (Dr D C Garratt), 122
Control Technology Measurement and (Society of Instrument Technology and the Royal Dutch Institute of Engineers Joint Conference on), 1241
Controlled Absence of Extracellular Glucose Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the (P Volfin, D Eboué and H Clauser), 166
Conventional Methods of Converting Heat into Electricity (British Association for the Advancement of Science, Section A (Mathematics and Physics) and Section G (Engineering), Joint Discussion on), 701
Conventional and Germ-free Chicks Serotonin in the Small Intestine of (Prof A W Phillips, H R Newcomb, J E Smith and R Lachapelle), 380
Conversion of 2-^{14}C-Pteroyl-L-Monoglutamic Acid into Isoxanthopterin in *Drosophila melanogaster* (Dr J A Blair), 757
Conversion (Energy) Unconventional Methods of (Prof D A Wright), 701
Conversion (Thermionic), of Heat to Electricity (R V Harrowell), 611
Converting Heat into Electricity Conventional Methods of (British Association for the Advancement of Science, Section A (Mathematics and Physics) and Section G (Engineering), Joint Discussion on), 701
Coogan, Dr C K , and Gutowsky, Prof H S At the Third Australian Spectroscopy Conference (Nuclear Magnetic Resonance in Sodium Hydrosulphide), 929
Cook, Dr C L , and McFarlane, J A At the Third Australian Spectroscopy Conference (Spectral Characteristics of the Emission from an Ammonia/Bromine Pentafluoride Diffusion Flame), 928
Cook, Captain James The Journals of, on his Voyages of Discovery (edited by Dr J C Beaglehole), Vol 2, The Voyage of the *Resolution* and *Adventure*, 1772-1775, *review* by Prof R Firth, 1107

Cranmer, Dr V At the Third Australian Spectroscopy Conference (Analysis of the Vibrational Spectrum on Mono-methyl-arsine), 927
Craven, G , and others Microwave Measurement Techniques (Equipment for the Automatic Recording of Wave-guide Attenuation), 410
Crawford, Prof Malcolm *Obituary* of Prof R F Naylor, 16
Creative Ability, 1
Creep (Tertiary) Stress Concentration Effects in (Dr P W Davies and B Wilshire), 1281
Crick, Dr F H C and others General Nature of the Genetic Code for Proteins, 1227
Cricket (House), *Acheta domesticus* L Home and Distribution of the (Dr A S K Ghouri), 1000
Crookall, J O , and others Analysis of the Relationship between Deposition of Long-lived Fission Products and Level of Activity in Milk, 1009
Crooke, W M , and others Cation-Exchange Capacities of Tissues of Higher and Lower Plants and their related Uronic Acid Contents, 142
Crosby, N T , and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Experiments to break the Insolubilizing Cross-links of Mature Bovine Collagen after Alkaline Pretreatment), 613
Cross-Resistance and Rates of Emergence of Resistance Biological Spectrum of some New Tuberculostatic 1,3,4-Oxadiazolones with special reference to (Prof A E Wilder Smith and Hans Brodhage), 1195
Cross-Sectional Analysis Validity of Prediction based on (Gwynneth de la Mare and R Sergean), 1318
Crosse, J E , and Garrett, Constance M E Relationship between Phage Type and Host Plant in *Pseudomonas mors-prunorum* Wormald, 379
Crosse, R , and others Venturicidin, a New Antifungal Antibiotic of Potential Use in Agriculture, 952
Crotocin Enzymic Inactivation of Trichothecin and (Dr I Horvath and J M Varga), 88
Crowle, Dr Alfred J , and Lueker, David C Antigen–Antibody Precipitation contrasted in Gels of High and Physiological Salt Concentrations, 50
Croxatto, H , and Belmar J Hypertensive Effects of Bradykinin in Rats, 879
Crucible (A Cold), for High-Temperature Melting Processes (H F Sterling and R W Warren), 745
Cruft, Dr H J , and Leaver, J L Isolation of Histones (?) from *Staphylococcus aureus*, 556
Crystal Lattice Molecular Disarray in a, produced by a Fission Fragment (Dr F P Bowden and L T Chadderton), 31
Crystal Structure of 2,5-Dimethyl-Dithio-Furophthene, a Homologue of Thio-Thiophthene (Dr M Mammi, R Bardi, G Traverso and S Bezzi), 1282
Crystal Structure of 2-Phenylazulene (Prof B D Sharma and J Donohue), 863
Crystal Structure Analysis The Theory of (A I Kitaigorodskii), translated from the Russian by David and Katherine Harker, *review* by Dr. M M Woolfson, 904
Crystal Structures of Salts of Methylated Purines and Pyrimidines (R F Bryan and K Tomita), 812
Crystal (Single-) Graphite from Melts Preparation of (Pei Ching Li), 864
Crystal and Molecular Structure of Diphenyl (Dr G B Robertson), (August 5, 593), *erratum*, 1026
Crystalline Potassium Chloride Incorporation of Trivalent Cations in (Dr Marian E Hills and Prof Allen B Scott), 1066
Crystalline Type of Starch in Soybean Seedlings Effect of Temperature during Germination on the (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
Crystalline (Para-) Spherulites of Biological Origin Some Physico-Chemical Properties of (Dr G T Stewart), 624
Crystallization (Dr J W Mullin), *review* by Dr S H Bransom, 695
Crystallization of the Complex of D-Amino-Acid Oxidase and 'Substrate-Substitute' (Kunio Yagi and Takayuki Ozawa), 70
Crystallization of Cytochrome b_2 Free of the Deoxyribonucleic Acid Component (Prof R K Morton and Kathryn Shepley), 639
Crystallization of Deuterated Ribonuclease (Dr J Bello and Dr D Harker), 756
Crystallographic Data for Urea Calcium Nitrate and Urea Cadmium Nitrate (Dr C G C Catesby), 254
Crystals Ionic-Covalent Bonding in (C H L Goodman), 355 , (E Mooser and W B Pearson), 355
Crystals (Ice), at Low Temperatures Investigation with the Electron Microscope of the Sublimation of (Prof Tokio Nei), 1177
Csaba, G , and others Role of the Thymus in Polysaccharide Metabolism, 1304
Csaki, L , and others Role of the Thymus in Polysaccharide Metabolism, 1304
Csapo, Dr Arpad I , and Lloyd-Jacob, Marny A Effect of Progesterone on Pregnancy—Method of Administration and Effect of Progesterone, 329
Csapo, Dr Arpad I (Luukkainen, Dr Tapani, and) Effect of Progesterone on Pregnancy—Effect of a Phospholipid Factor on the Activity of Progesterone, 331
Culicoides austeni (Carter, Ingram and McFie) Biological Species confused under the Name (D H Murphy), 186
Cullen, Prof A L Microwave Measurement Techniques (Power Measurement), 409
Cullen, Prof A L (French, Dr H A , and) Microwave Measurement Techniques (Wattmeter for use at Millimetre Wave-lengths), 410
Cullen, Dr J M Animal Behaviour (Natural Behaviour of Animals—The Stickleback), 210
Cullis, Dr C F Sampling and Analysis of Combustion Products, *review*, 1108
  Oxidation Processes in Chemical Manufacture (Gaseous Oxidation of Organic Compounds), 1135
Culshaw, Dr W , and Anderson, M V Microwave Measurement Techniques (Fabry-Pérot Interferometers and their use for the Measurement of Permittivity of such substances as TiO_2), 410
Cultivated Forms of *Brassica oleracea* Juvenile Forms in (Dr L G G Warne), 889
Cultivation of Goitrogenous and Non-Goitrogenous Cabbage (J Sedlak), 377
Cultivation of Monolayer Cultures of Frog Renal Cells (Dr Walter Auclair), 467
Cultivation (Axenic), of an Enchytraeid Annelid (Dr Ellsworth C. Dougherty and Bjørn Solberg), 184

Culture Œstrogen Content of Plants as a Function of Conditions of (Prof R Ferrando, M M Guilleux and A Guerrillot-Vinet), 1205
Culture of Human White Cells using Differential Leucocyte Separation (James Hastings, Stanley Freedman, Orlando Rendon, Herbert L Cooper and Kurt Hirschhorn), 1214
Culture (Cell) Antigenicity of Guinea Pig Testicular Cells grown in, as determined by the Isolated Ileum Technique (Dr Seymour Katsh and Dr Russell T Jordan), 770
Culture (Continuous), of Micro-organisms (Czechoslovak Academy of Science Second International Symposium on), 213
Culture (*in vitro*) Uptake and Incorporation of Tritiated Thymidine in (Dr W M Rigal), 768
Culture (Soil) Survival of *Rhizobium meliloti* in (H L Jensen), 682
Culture (Tissue), of Human Bone Marrow treated with Human Deoxyribonucleic Acid Formation of Different Haemoglobins in (Prof Lorraine M Kraus), 1055
Culture (World) Contributions of Czechoslovak Science and Arts to (Czechoslovak Society of Arts and Sciences in America Symposium on), 309
Culture Collections Specialists' Conference on, 309
Culture Medium (A Simplified), for the Production of Collagenase (Dr G H Warren and Jane Gray), 755
Culture Production (Submerged), of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Cultured Fibroblast Increase in the Dense Cytoplasmic Bodies in Radiation-induced Giant Cells of the (Dr A F Hayward), 891
Cultured Tissues (Fresh and) Chromosome Preparation from, using a Modification of the Drying Technique (M Fox and Dr I M Zeiss), 1213
Cultures (*Azotobacter*) Detection of Gibberellic Acid in (V Vančura), 88
Cultures (Bacteria-free) Isolation of, from Hormogone-producing Blue-Green Algae (Blue-Green Algae), (Dr J S Bunt), 1275
Cultures (Different Age-), of *Escherichia coli* K12 Effect of Ultra-Violet Radiation and Desiccation on (I L Mulay and G S Sperti), 773
Cultures (Fibroblast) Cytotoxic Effect of Aminoacetonitrile on, and its Prevention by Histidine (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Cultures (Human Tissue) Growth of Contagious Pustular Dermatitis Virus in (Prof A Macdonald and T M Bell), 91
Cultures (Mixed), of *Rhodopseudomonas capsulatus* and *Azotobacter vinelandii* Production of Slime Substance in (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Cultures (Monolayer), of Frog Renal Cells Cultivation of (Dr Walter Auclair), 467
Cultures (Serum-free Cell) Cytopathic Protective Factor, its Production by Normal Uninfected (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Culturing and Collecting the Nematode *Panagrellus redivivus* A Chamber for (E J Winkler and Prof David Pramer), 472
Cumming, John Awarded a Fellowship in nuclear physics in the University of Glasgow, 1132
Cummins, Dr R A At the Third Australian Spectroscopy Conference (Analysis of Lubricating Oils for the additive Elements Barium, Phosphorus, Calcium and Zinc with a Direct-reading Spectrograph), 928
Cunliffe, Prof A C (Jones, Valerie E, and) A Precipitating Antibody to Insulin, 136
Cunningham, Prof G J, and others Intracellular Response to an Iso-immune Reaction at the Surface of Ascites Tumour Cells, 1302
Cunningham, J B W Resignation as managing director of the Engineering Group of the United Kingdom Atomic Energy Authority, 505, work of, 505
Cuprous Oxide and Sodium Silicate A Coating with Antifouling Properties from the Reaction between (J R Rischbieth and F Marson), 748
Curran, Dr S C *Obituary* of Prof E Taylor Jones, 605
Current Curves (Thermo-stimulated) Dependence of, on Heating Rate (C G Clayton, J B Whittaker, G A Briggs and T G Kelly), 349
Current Trends in Scientific Research (Prof Pierre Auger), *review* by R Brightman, 850
Curricula (School Science) Revision of, 307
Currie, Ronald I The Intergovernmental Oceanographic Commission, 1015
Curtis, Dr D R, and Davis, Dr R A Central Action of 5-Hydroxytryptamine and Noradrenaline, 1083
Curves (Thermo-stimulated Current) Dependence of, on Heating Rate (C G Clayton, J B Whittaker, G A Briggs and T G Kelly), 349
Cusworth, D C, and Westall, R G Determination of Argininosuccinic Acid by Ion-Exchange Chromatography, 555
Cuticle of the Nematode *Ascaris lumbricoides* Localization of Esterase in the (Dr D L Lee), 282
Cutting, Dr C L Fish in Nutrition, 1013
Cuvettes (Modified), for Photoelectric Spectrophotometry (Dr Malcolm H Smith), 722
Cvetkovic, D, and others Effects of Electrical Stimulation of Reticular Formation on the Lactic Acid Content of the Rat Brain, 1166
Cycle (Dynamic Organic Matter), in Soils Aspects of the (Welsh Soils Discussion Group Discussion on), 309
Cycle (Viral) Cyclic Events in the (Dr André Lwoff and Marguerite Lwoff), 477
Cyclic Events in the Viral Cycle (Dr Andre Lwoff and Marguerite Lwoff), 477
Cyclic Tetramer of Chloral (Maximo Baron), 258
Cyrillic Transliteration, 405
Cysteine Counteraction by, of Glycogenolysis and Inhibition of Microsomal Protein Synthesis produced by Dimethylnitrosamine (Dr P Emmelot and I J Mizrahi), 42
L-Cysteine Effect of Derivatives of, on Growth of *Leuconostoc mesenteroides* (8042), (A B K Njaa), 463
Cystine Determination of Biological Availability of Methionine and (D Guttridge, Dr D Lewis and J T Morgan), 753
Cystine Content in Hair of Children as influenced by Vitamin A and Animal Protein in the Diet (Tatsuo Koyanagi and Teru Takanohashi), 457
Cystine Derivative Isolation of a, from Silk (Dr C Earland and Dr D J Raven), 1185
Cystine Solutions (Aqueous) Products of the γ-Radiolysis of (Dr D W Grant, S N Mason and M A Link), 352
Cytidine Diphosphate in the Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of (Dr J J Saukkonen), 816
Cyto- Chemistry (Oxidative Enzyme Histo- and) Use of Tetrazolium Compounds in (Prof C G Rosa and Kwan-Chung Tsou), 990
Cytochrome b_2 Free of the Deoxyribonucleic Acid Component Crystallization of (Prof R K Morton and Kathryn Shepley), 639
Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and Apoprotein Derivatives Structure and Properties of the Flavohaemoprotein, (Prof R K Morton), 727
Cytochrome c (Horse Heart) Amino-Acid Sequence of—Peptides, released by Digestion with Chymotrypsin (Dr E Margoliash and Prof Emil L Smith), 1121, Peptides, Terminal and Internal, released by Digestion with Trypsin (Dr G Kreil and Prof H Tuppy), 1123, The Complete Amino-Acid Sequence (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125
Cytochrome Oxidase in Preparations from Two Ox Muscles Comparative *in vitro* Activities of Phosphorylase *b* and (E J Briskey and R A Lawrie), 263
Cytochrome *c* Oxidase, the Terminal Oxidase of *Iris pseudacorus* L (G G Henshaw, D A Coult and D Boulter), 579
Cytochrome and Chlorophyll C_2^+ (Oxidised), in Photosynthesis (Dr H T Witt, A Muller and B Rumberg), 967
Cytochromes Prostatic (Leonora Hopkinson and F L Jackson), 264
Cytochromes (Chloroplast) Response of, to Light and Substrates (Prof H Lundegardh), 243
Cytodifferentiation and Macromolecular Synthesis (Society for the Study of Development and Growth Symposium on), 802
Cytology of Nervous Tissue Papers on (Annual General Meeting of the Anatomical Society of Great Britain and Ireland), 406
Cytology and Evolution (Dr E N Willmer), *review* by Dr I Leslie, 4
Cytology and Origin of the Dwarf Coconut Palm (Dr M S Swaminathan and M C Nambiar), 85
Cytopathic Effect Serial Propagation of Types 1, 2, 3 and 4 Dengue Virus in HeLa Cells with Concomitant (Sonja M Buckley), 778
Cytopathic Protective Factor, its Production by Normal Uninfected Serum-free Cell Cultures (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Cytoplasmic Bodies (Dense), in Radiation-induced Giant Cells of the Cultured Fibroblast Increase in the (Dr A F Hayward), 891
Cytotoxic Effect of Aminoacetonitrile on Fibroblast Cultures and its Prevention by Histidine (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Czechoslovak Academy of Science Second International Symposium on Continuous Culture of Micro-organisms, 213

de Whalley, H C S *Obituary* of Lewis Eynon, 798
de la Mare, Gwynneth, and Sergean, R Validity of Prediction based on Cross-Sectional Analysis, 1318
'DEAE-Sephadex' Separation of Low Molecular Weight Peptides from Amino-Acids on (P R Carnegie), 658
Deaminase (5′-Adenylic Acid), in Dystrophic Mouse Muscle (Dr R J Pennington), 884
Dear, R E A (Pattison, Prof F L M, and) Synthesis of the Toxic Principles of *Dichapetalum toxicarium* (18-Fluoro-*cis*-9-Octadecenoic Acid), 1284
Death Arsenic Content of Napoleon I's Hair probably taken immediately after his (Dr Sten Forshufvud, Dr Hamilton Smith and Dr Anders Wassén), 103
Debus, Dr A G Chemistry in the Service of Medicine (Paracelsian Doctrine in English Medicine up to 1660), 1017
Decametric Radiation (Jovian) Presence and Correlation of Fine Structure in (James N Douglas and Harlan J Smith), 741
Decarboxylation (Oxidative), of Indole-3-acetic Acid by Mangani-Versene and by Wheat Leaf Enzyme (Prof R A Abramovitch and K S Ahmed), 259
Decay of Anode Concentration Polarization Evaluation of Boundary Layer Thickness in Electrolytic Systems from (Leonard Nanis), 449
Decimetre Radio Bursts concurrent with Solar Type IV Radiation (T Krishnan and R F Mullaly), 58
Decomposition of Lead Azide Kinetics of Reaction of the (Dr M Stammler, J E Abel and Dr R C Ling), 626
Decomposition (Catalytic), of Ethylene on Nickel (Douglas W McKee), 654
Decomposition (Thermal), of Ammonium Perchlorate in presence of Zinc Oxide (Dr F Solymosi and L Révesz), 64
Deep-Hibernating Hedgehog (Pre-Hibernating and) Changes of Blood Volume in the (Dr Einar Eliassen), 1047
Deer (Red) in Sweden, 30
Deer (Red), and other Species Serum β-Globulin Types in, and their Stability in the Presence of Bacteria (V P W Lowe and E I McDougall), 983
Defant Prof Albert Physical Oceanography *review* by Dr J C Swallow, 101
Defares, Dr J G, and others New Indirect Fick Procedure for the Determination of Cardiac Output, 760
Defendi, Vittorio (Kritchevsky David, and) Persistence of Sterols other than Cholestrol in Chicken Tissues, 71
Deficiency (Copper), in White Clover Effect of, on Nitrogen Fixation (F H van der Elst, K J McNaught and W F Rolt), 1315
Deficiency (Red Cell Enzyme) Absence of in Australian Aborigines (Prof O Budtz-Olsen and Dr Chev Kidson), 765
Definition of Rate Constant and Activation Energy in Solid State Reactions (W Gomes), 865
Degeneration (Seminal), induced in Merino Rams by the Administration of Stilboestrol Dipropionate (G R Moule and P E Mattner), 364
Dehydrogenase (Liver Alcohol) Mechanism of Action of (Prof Hugo Theorell and Dr J S McKinley McKee), 47, *erratum*, 710
Dehydrogenase (Nucleolar Succinic), in Mouse Mammary Carcinoma Cells (P De, R Chatterjee and Dr S Mitra), 285
Dehydrogenase (Uridine Diphosphoglucose), in Cartilage Histochemical Localization of (Dr Karoly Balogh, jun, and Richard B Cohen), 1199
Dehydrogenase (Xanthine) in the Silkworm, *Bombyx mori* L Properties of (Yoshiyuki Hayashi), 756
Dehydrogenase Activity (Glucose-6-Phosphate), in Papuans (Dr B P K Ryan and I C Parsons) 477
Deiodination of Thyroxine-^{131} I in Tumour-bearing Rats (J A Stein, M Anbar, S Guttmann and N Ernst), 1303
Delande, N (Lacourt, A, and) Microchemical Techniques (Investigation of the Identification of some sixteen Amino-Acids by the Hot-stage observation of Eutectic Temperatures with twenty-five different Components), 411
Delayed Effects of Whole-Body Radiation—a Symposium jointly sponsored by the Operations Research Office and the Walter Reed Army Institute of Research (edited by Bernard B Watson), *review* by Dr Hugh D Evans, 6
Delta (Mackenzie River) Effect of a Lake on Distribution of Permafrost in the (G H Johnston and R J E Brown), 251
Demand (Long-Term), for Scientific Manpower (Statistics Committee of the Advisory Council on Scientific Policy Survey on), 293
Demethylation of the Plant Œstrogen Biochanin A in the Rat (Anna Nilsson), 358
Democracy Excellence and Leadership in a, 899
Demonstration of Extra- and Intra-cellular Stages of Gregarine and Coccidian Protozoa Periodic Acid–Schiff Technique for the (Dr J B Jennings), 473
Demonstration of Interaction Products of Adenine and Adenosine Phosphates with Formaldehyde (Dr D L Woodhouse), 336
Demonstration and some Properties of Peroxidase in Pig Thyroid Gland (Toichiro Hosoya and Nobuo Ui) 659
Demonstration of Stages of *Eimeria* in Tissues Limitations of the Periodic Acid–Schiff Technique for the (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Demonstration (Histochemical) of γ-Glutamyl Transpeptidase-like Activity (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 338
Den, Halina, and others Particle Involvement in Fatty Acid Synthesis in Liver and Yeast Systems, 1287
Denbigh, Prof K G Appointed to the Courtaulds chair of chemical engineering in the Imperial College of Science and Technology, London, 710
Dengue Virus Serial Propagation of Types 1, 2, 3 and 4 in HeLa Cells with Concomitant Cytopathic Effect (Sonja M Buckley), 778
Deniker, P, and others (edited by) Proceedings of the First International Congress of Neuro-Psychopharmacology (Rome, 1958), *review* by Prof W Ross Ashby, 392
Denny Scholarship in Marine Engineering (1961) awarded by the Royal Institution of Naval Architects to David K Brown, 309
Dense Cytoplasmic Bodies in Radiation-induced Giant Cells of the Cultured Fibroblast Increase in the (Dr A F Hayward), 891
Density (*F*-Region Electron), with Sunspot Number Atmospheric Scale Height as a Modifying Influence on Linear Trend of (Jean M Bullen) 542
Density of Light (Colour and), and Broiler Performance (C G Payne), 769
Deoxyribonuclease Activity of as related to Root-Growth (Dr R Goutier and M Goutier-Pirotte), 371
Deoxyribonuclease and Ribonuclease Action of, on the Growth of Ehrlich Ascites Carcinoma in Mice (Dr Gaston de Lamirande), 52
Deoxyribonucleic Acid Binding of *RP2-L*—a Nuclear Protein of Neoplastic Tissues—to (Paul Byvoet and Prof Harris Busch), 870
  Detection of Inclusion Bodies containing by means of Autoradiography (Dr Moshe Aronson and Dr Sanford S Elberg), 981
  Nature of Increased Protein and, in Chronic Hepatic Injury (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and Hans Popper), 886
  Structure, Synthesis and Function of (Société de Chimie Physique Discussion on), 24
Deoxyribonucleic Acid in Normal and Tumour Strain Cells Action of Radiation on Synthesis of (Dr John Seed), 944, *erratum*, 1241
Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the (Dr M Quintiliani M Boccacci and L Tentori), 573
Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation Pituitary Effect on Synthesis of (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet Chromatography and Nucleotide Sequences of (T Hudnik-Plevnik and Dr L A Stocken), 554
Deoxyribonucleic Acid Component Crystallization of Cytochrome b_2 Free of the (Prof R K Morton and Kathryn Shepley), 639

Deoxyribonucleic Acid Content (Nuclear), in the Adrenal Cortex of the Female White Rat during the Œstrual Cycle Variations in the (E Brañez and H Roels), 1043
Deoxyribonucleic Acid Solutions Relaxation Enhancement by Paramagnetic Ion Binding in (J Eisinger, R G Shulman and W E Blumberg), 963
Deoxyribonucleic Acid (Herring-Sperm) Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of (Prof A Stolk), 1215
Deoxyribonucleic Acid (Human) Formation of Different Haemoglobins in Tissue Culture of Human Bone Marrow treated with (Prof Lorraine M Kraus), 1055
Dependence of Thermo-stimulated Current Curves on Heating Rate (C G Clayton, J B Whittaker, G A Briggs and T G Kelly), 349
Deposition of Long-lived Fission Products and Level of Activity in Milk Analysis of the Relationship between (Dr W Anderson, L K Burton and J O Crookall) 1009
Deposits (Insecticidal) A Technique for Exposing Individual Flies on (H C M Parr and J E H Grose), 475
Deposits (Pleistocene and Holocene), in the Haua Fteah Absolute Age of (Dr C B M McBurney), 685
Depot Fat (Human) An Unusual Major Fatty Acid Component in (Dr D S McLaren and W W C Read), 265
Depot Fat Iodine Number in Children Ambient Temperature and (I Macdonald), 363
Deprivation (Sensory), and Foetal Circulatory Homeostasis (Prof S R M Reynolds), 818
Deraeocoris olivaceus Increase in Distribution of (Dennis Leston and G E Woodroffe), 188
Derivative of Cytidine Diphosphate in the Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a (Dr J J Saukkonen), 816
Derivative (Cystine) Isolation of a, from Silk (Dr C Earland and Dr D J Raven), 1185
Derivatives Antibacterial Synthetic Polypeptide (Dr K Kovacs, Dr A Kotai, I Szabo and R Mecseki), 190
  Carcinogenicity of the Methyl-1,2-Benzanthracenes and their (Dr O Chalvet and Dr R Mason), 1070
Derivatives of L-Cysteine Effect of, on Growth of *Leuconostoc mesenteroides* (8042), (A B K Njaa), 463
Derivatives (Apoprotein) Structure and Properties of the Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and (Prof R K Morton), 727
Derivatives (1,2-Benzanthracene), in a Kuwait Mineral Oil (Dr W Carruthers and A G Douglas), 256
Derivatives (Carbohydrate *O*-Isopropylidene) Chromatographical Separation of (J E G Barnett and Dr P W Kent), 556
Derivatives (Dichloroacetyl), of Amino-Acids Acylase Activity of Ascites Tumour Cells on (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
Derivatives (Naturally Occurring), of Proline Structures and Conformations of some (R J Abraham, K A McLaughlan, Shirley Dalby, Prof G W Kenner, R C Sheppard and L F Burroughs), 1150
Derivatives (Some Tetrahydropyranyl), of Glycine, Serine and Urea (S M Amir, Dr M Z Atassi, Dr S A Barker, Dr J S Brimacombe and Dr M C Keith), 1069
Dermatitis Virus (Contagious Pustular) Growth of, in Human Tissue Cultures (Prof A Macdonald and T M Bell), 91
Dermovaccinia Virus A New Mutant of (Dr Isamu Tagayu, Dr Takashi Kitamura and Dr Yumiko Sano), 381
Desalters (Electrolytic) Hydrolysis of Hippuric Acid in (Dr E McEvoy-Bowe), 1072
Descriptive Palaeoclimatology (edited by A E M Nairn), *review* by Prof F W Shotton, 828
Deserts (Salt), of the World Salt Marshes and (Prof V J Chapman), *review* by Prof W T Williams, 833
Desiccation Effect of Ultra-Violet Radiation and, on Different Age-Cultures of *Escherichia coli* K12 (I L Mulay and G S Sperti), 773
Design Computer, *review* by Dr M V Wilkes, 489
Design of Experiment A Chemist's Introduction to Statistics, Theory of Error and (Dr D A Pantony), 213
Design of Inductance Coils The Theory and (Dr V G Welsby), second edition, *review* by Prof A H M Arnold, 845
Design of Laboratory High-Temperature Induction Furnaces (P H Dundas), 114
Design Fundamentals of Analog Computer Components (Prof R M Howe), *review* by Dr M V Wilkes, 489
Desk Worker Morale in the Civil Service, a Study of the (Nigel Walker), 1003
Desmedt, Dr J E, and Monaco, Dr P Mode of Action of the Efferent Olivo-Cochlear Bundle on the Inner Ear, 1263
Desulphovibrio desulphuricans Sulphate Transport and Metabolism by (Prof C Furusaka), 427
Detecting Anaphylactic Sensitivity A New Test for—the Basophil Reaction (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
Detecting Reversion in *T4r*II Bacteriophage to r^+ induced by Ultra-Violet Irradiation (Prof C E Folsome and D Levin), 1306
Detection of the Benzene Ring in Organic Compounds Pyrolysis and Gas Chromatography for the (J H Dhont), 747
Detection of Carboxyl Groups in Conjugation with the Porphyrin Ring System (P S Clezy), 750
Detection of Gibberellic Acid in *Azotobacter* Cultures (V Vančura), 88
Detection of Haemolytic Activity of Streptolysins *O* and *S* in Agar-Gel Electrophoretic Mobility and (Extra-cellular Esterase of Group A Streptococci), (A H Stock and José Uriel), 435
Detection of Inclusion Bodies containing Deoxyribonucleic Acid by means of Autoradiography (Dr Moshe Aronson and Dr Sanford S Elberg), 981
Detection by Ionization of Gases in Helium used in Gas Chromatography (W A Wiseman), 964
Detection of a Possible Intermediate in Oxidative Phosphorylation (Dr C H Suelter M DeLuca, Dr J B Peter and Prof P D Boyer), 43
Detection of Spin Magnetization Variation in a Two-level Maser Oscillator (I M Firth and Dr D Bijl), 860
Detection (Experimental), of Auto-Ionizing Transitions in Krypton by Electron Impact (John F Burns), 651
Detection and Distribution of Enzymes for oxidizing Thiocysteamine (D Cavallini, C De Marco and B Mondovi), 557
Detergent (Dodecylbenzenesulphonate) Action of a, on the Gills of the Trout (O J Schmid and H Mann), 675
Detergents (Synthetic) Fourth Progress Report of the Standing Technical Committee on (Ministry of Housing and Local Government), 1142
Determination of the Amino-Acid Composition of Bovine Growth Hormone (Dr Alan J Parcells), 971
Determination of Argininosuccinic Acid by Ion-Exchange Chromatography (D C Cosworth and R G Westall), 555
Determination of Biological Availability of Methionine and Cystine (D Guttridge, Dr D Lewis and J T Morgan), 753
Determination of Bradykininogen in Blood Plasma A Micromethod for the (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Determination of Calcium in Saliva Application of Atomic Absorption Spectroscopy to the (Ernest Newbrun), 1182
Determination of Cardiac Output New Indirect Fick Procedure for the (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
Determination of Cell Numbers in Leaf Primordia (Dr E J Hewitt and L A Wilson), 578
Determination of Sulphosalicylo-soluble Proteins using Tannin Preparation and (W Mejbaum-Katzenellenbogen, W Dobryszycka and B Morawiecka), 262, *erratum*, 802
Determination (Age) Uranium in the Sikhote–Alin Meteorite and its relation to the Lead Method of (Edward L Fireman and David E Fisher), 644
Determination (Exact) of the Lunar Mass by means of Selenoid Satellites (Dr E T Benedikt), 442
Determination (Separation, Identification and), of the Fatty Acids of Montan Wax (D R Hewett, P J Kipping and P G Jeffery), 65
Determination (Sex), in Hemp Influence of the Age of Pollen and Stigmas on (Regina Laskowska), 147
Determinations (Age), of Rocks in the Lizard (Cornwall) Area (J A Miller and D H Green), 1175
Determinations (Potassium–Argon Age), on Granite from the Island of Mahé in the Seychelles Archipelago (J A Miller and J D Mudie), 1174
Determining Chromatographic Purity Use of Phenol in (B H Koeppen), 360
Deuchars, Dr W M, and Lawrence, G P The Reaction Silicon-29(n,α)-Magnesium-26 at 14 MeV Neutron Energy, 1278
Deurinck, G At the twenty-seventh Conference of the International Federation for Documentation, 219
Deuterated Ribonuclease Crystallization of (Dr J Bello and Dr D Harker), 756
Deuterium Oxide Medium Effect of γ-Radiation on *Escherichia coli* grown in (Ernest Pollard), 177
Developing Chicken Embryo Comparison of the Serum Protein Fractions of the, by the Technique of Starch-Gel Electrophoresis (A Amin), 356
Developing Countries Agricultural Problems in (Nutrition Society Symposium on), 1028
  Food and Agriculture in (Prof A H Bunting), 1028
Development Electrical Power (A J Ellison), 500
Development of Ideas on the Structure of Metals before 1890, A History of Metallography—the (Prof Cyril Stanley Smith), *review* by Prof F C Thompson, 843
Development of the Lower Archegoniate Plants The Growth and (Linnean Society of London International Symposium on), 710
Development of the Major Ideas in the Physical Sciences from the Earliest Times to the Present The Search for Order—the (Cecil J Schneer), *review* by Prof Herbert Dingle 901
Development of Natural Resources Role of Science in the, with particular reference to Iran, Pakistan and Turkey (Scientific Council of the Central Treaty Organization Symposium on), 609
Development of *Ostertagia* spp in Sheep Effect of Whole-Body Irradiation and Cortisone on the (J D Dunsmore), 139
Development of the Polychaete *Fabricia sabella* (Ehr), (D B Lewis), 80
Development of the Thymus of the Foetal Rabbit Hormonal Control of the (J G Bearn) 875
Development and Growth, Society for the Study of Symposium on Cytodifferentiation and Macromolecular Synthesis, 802
Development (Embryonic), of the Cestode *Diorchis ransomi* Schultze, 1940 Cell Reduction in the (Krystyna Rybicka), 771
Development (Industrial Research and), in the United States, 809
Development (Metallurgical Research and) Symposium on Pilot Plants in, held at the National Metallurgical Laboratory, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Development (Research and) Control of Government Expenditure on (House of Commons Debate on), 1239
Development (Research and), in the Gas Industry 306
Development (Research and), in Industry Funds for, 1958 (United States National Science Foundation, Surveys of Science Resources Series, NSF 61-32), 809
Developments in Astronautics (A Cadman Clinton), 310
Developments in Medical Treatment Recent (*Practitioner*, Vol 187, No 1120), 506
Developments in Polarography Recent (Dr G W C Milner), 213
Developments in Veterinary Science, *review* by Prof Harold Burrow, 198
Devi, Dr Anima, and others Effects of Irradiation on the Incorporation of Amino Acid into Normal and Regenerating Rat Liver, 179
Dextran during Prolonged Storage Stability of (Dr W d'A Maycock and Dr C R Ricketts), 174
Dey, A K, and Singh, E J Microchemical Techniques (Behaviour and Application of various Complexing Agents in the Separation of Metal Ions by the Weiss Ring-oven Technique), 412
Dhar, Prof N R Elected a corresponding member in the Chemistry Section of the Paris Academy of Sciences, 1026
Dhont, J H Pyrolysis and Gas Chromatography for the Detection of the Benzene Ring in Organic Compounds, 747
Diabetes A Study of, *review*, 391
Diabetes in an English Community (Dr Joan B Walker and David Kerridge), *review*, 391

Diabetes Mellitus Absorption and Excretion of Penicillin injected into the Muscles of Patients with (Dr L Weinstein and Dr R H Meade), 987
Diacumakos, Elaine, and Day, Emerson Scanning Techniques in Biological and Medical Microscopy (The 'Cytoanalyser' for the Mass Screening of Cervical and Vaginal Smears, to aid in the Early Diagnosis of Cancer), 1031
Diagnostic Measurements of Transient Magnetic Fields A New Application of the Faraday Magneto-Optical Effect for (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
7 9-Dialkylguanines Acidic Dissociation of, and its Possible Relation to Mutagenic Properties of Alkylating Agents (Dr P D Lawley and P Brookes), 1081
Dialkylnitrosamines Mechanism of the Hepatoxic Action of (Dr D F Heath), 170
Diamond, Dr L K, and others Genetical Evidence for Synthesis of Transferrin in the Foetus, 182
Diamond Jubilee of Trans-Atlantic Radio, 919
Diapause in an Aquatic Mymarid (D J Jackson), 823
Diapause (Non-), in Spider Mites Relation between Organophosphorus-Resistance and (W Helle), 1314
Diaphragm (Isolated Rat) Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the, in the Controlled Absence of Extracellular Glucose (P Volfin, D Eboue and H Clauser), 166
Diarsine Complexes (Eight-Co-ordinate), of Quadrivalent Metal Halides (Dr R J H Clark, Dr Jack Lewis, Prof R S Nyholm, Dr Peter Pauling and Dr G B Robertson), 222
Diatom (Marine) Penetration of Spines from a, into the Gill Tissue of Lingcod (*Ophiodon elongatus*), (Dr Gordon R Bell), 279
Dibenzo(*a*,l)pyrene Carcinogenicity of (Ernest L Wynder and Dietrich Hoffmann), 1092
Dichapetalum toxicarium (18-Fluoro-*cis*-9-Octadecenoic Acid) Synthesis of the Toxic Principle of (Prof F L M Pattison and R E A Dear), 1284
Dichloroacetyl Derivatives of Amino-Acids Acylase Activity of Ascites Tumour Cells on (Yukio Kameda, Katsuhiko Matsui, Yukui Kimura and Etsuko Toyoura), 468
Dicke, Prof R H Dirac's Cosmology and Mach's Principle, 440
Dicke, Prof R H, and Wittke, Dr James P Introduction to Quantum Mechanics, *review* by S F Edwards, 1005
Dicker, Dr G H At the First British Insecticide and Fungicide Conference (Fruit Tree Pests), 1141
Dictionary The British Medical (edited by Sir Arthur Salusbury MacNalty), *review* by Dr K M Hawkins, 849
  A New Medical, *review* by Dr K M Hawkins, 849
Dictionary (International), of Physics and Electronics, second edition, *review* by J R Tillman, 1111
Dictionary (Medical) Stedman's, twentieth edition, *review* by Dr K M Hawkins, 1222
Dictionary of Automation, Computers, Control and Measuring, in Six Languages, English/American, French, Spanish, Italian, Dutch and German Elsevier's (compiled and arranged on an English alphabetical base by W E Clason), *review* by S Whelan, 904
Dictyostelium mucoroides (Cellular Slime Mould) Trehalose in the (James S Clegg and Michael F Filosa), 1077
Dielectric Properties of Solid Secondary Alcohols A Transition in the (J S Dryden and H K Welsh), 255
Dielectrics Progress in (edited by Dr J B Birks and Prof J Hart), Vol 3, *review* by V Daniel, 203
  Rectifying Action of Non-uniform Fields in (Dr K C Kao), 650
Diepoxybutane and an Iron Chelator Production of Chromatid Aberrations by (Prof Norman S Cohn), 1093
Diesem, Prof Charles D, and others Anatomy and Histology of the Eye and Orbit in Domestic Animals, *review* by Dr E N Willmer, 295
Diet Cystine Content in Hair of Children as influenced by Vitamin A and Animal Protein in the (Tatsuo Koyanagi and Teru Takanohashi), 457
Diet of Sheep (G W Arnold), 113
Dietary Ascorbic Acid Effect of, on the Silkworm, *Bombyx mori* (Dr Toshio Ito), 951
Dietary Citrate and Hypomagnesaemia in the Ruminant (A W A Burt and D C Thomas), 1193
Dietetics World Review of Nutrition and (edited by Dr Geoffrey H Bourne, assisted by Eileen M H Wilson), Vol 2, *review* by Dr W R Aykroyd, 1006
2-Diethylaminoethyl 2,2-Diphenylpentanoate (SKF 525*A*) Effects of, on Insecticidal Potency (P S Hewlett, C J Lloyd and Angela N Bates), 1273
'Diethylaminoethylether-Sephadex' Separation of Low Molecular Weight Peptides from Amino-Acids on (P R Carnegie), 658
Diethylstilboestrol Effect of on the Serum γ-Globulin in the Guinea Pig (L M Charles and Prof T Nicol), 565
Dietrich, J (Walker, Prof G W R, and) Kinetin-induced Meiotic-Prophase Acceleration and Stasis in *Tradescantia* Anthers cultured on Media Deficient in Sugar, 889
Dietz, Dr Robert S Continental and Oceanic Differentiation, 124
Difference between High- and Low-Stress Fatigue (N E Frost), 446
Difference in Metabolism of Labelled Thyroxine between Thyrotropic and Adrenotropic Mouse Pituitary Tumours (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Difference Band of a Fundamental and a Lattice Mode in the Infra-red Spectra of Lead and other Carbonates (C J H Schutte and K Buijs), 351
Differences (Transferrin), in Chimpanzee Sera (Prof John Buettner-Janusch), 632
Different Age Cultures of *Escherichia coli* K12 Effect of Ultra-Violet Radiation and Desiccation on (I L Mulay and G S Sperti), 773
Different Haemoglobins Formation of, in Tissue Culture of Human Bone Marrow treated with Human Deoxyribonucleic Acid (Prof Lorraine M Kraus), 1055
Different Radiosensitivities Mouse Lymphoma Cells with (Dr P Alexander and Z B Mikulski), 572
Differential Equations of the Second Order Tables of Airy Functions and Special Confluent Hypergeometric Functions for Asymptotic Solutions of (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Differential Leucocyte Separation Culture of Human White Cells using (James Hastings, Stanley Freedman, Orlando Rendon, Herbert L Cooper and Kurt Hirschhorn), 1214
Differential Secondary Magnetization in some British Cambrian Rocks (D E T Bidgood), 39
Differentiation Continental and Oceanic (Prof J D Bernal), 123, 125, (Dr Robert S Dietz), 124, (Prof J Tuzo Wilson), 125
Differentiation (Neural) Localization of Inhibitors of, in Chick Embryos (Dr A K Katoh), 997
Diffraction (Electron) High-Speed Direct-Recording System for (Dr C W B Grigson), 647
Diffraction Examination (Neutron), of *p*-Diphenylbenzene X-Ray and (Prof C J B Clews, Dr E N Maslen, H M Rietveld and T M Sabine), 154
Diffraction Methods Chemical Applications of (Bradford Institute of Technology Course on), 21
Diffraction Orders (Ultrasonic) Distribution of Intensity among various (Dr C Raghupathi Rao), 220
Diffusion (Medium Range), in the Atmosphere (Royal Meteorological Society Symposium on), 13
Diffusion of Macromolecules A Cell for Rapidly Measuring Restriction to, through Agar Gels of various Pore Sizes (G K Ackers and R L Steere), 436
Diffusion Experiments (Atmospheric) Loss of Fluorescent Particles in, by Comparison with Radioxenon Tracer (A E J Eggleton and N Thompson), 935
Diffusion and Heat Flow in Liquids (H J V Tyrrell), *review* by Prof A R Ubbelohde, 845
Di-fluorocarbene Production and Properties of (Dr J P Simons and A J Yarwood), 943
Difluoromethylene Radical Heat of Formation of the (Dr J R Majer and Dr C R Patrick), 866
Digestion with Chymotrypsin Peptides released by (Amino-Acid Sequence of Horse Heart Cytochrome *c*), (Dr E Margoliash and Prof Emil L Smith), 1121
Digestion with Trypsin Peptides, Terminal and Internal, released by (Amino-Acid Sequence of Horse Heart Cytochrome *c*), (Dr G Kreil and Prof H Tuppy), 1123
Digestive Tract of Vertebrates Chitinase, an Addition to the List of Hydrolases in the (Dr Charles Jeuniaux), 135
Digital Computation at King's College, Newcastle-upon-Tyne, 708
Digital Computer High-speed (Programmed Data Processor) given to the Massachusetts Institute of Technology by the Digital Equipment Corporation, Maynard, Mass, 922
Digital Computer *Pascal* (*Philips* Technical Review, Vol 23, No 1), 1025
Digital Equipment Corporation, Maynard, Mass A High-speed Digital Computer (Programmed Data Processor) given to the Massachusetts Institute of Technology, 922
Dihydroxyacetone Production in *Acetomonas* (Dr J G Carr and J L Shimwell), 683
2,3-Dihydroxybenzoic Acid in Fermentation Liquors Formation of, during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall (R Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
3,4-Dihydroxyphenylethyleneamine Content and the Genome, *acuminata* Relationship between (L A Griffiths), 84
Dijksterhuis, Prof E J The Mechanization of the World Picture (translated by C Dikshoorn), *review* by J R Ravetz, 825
Dijkstra, J Quantitative Estimation of Peak Areas in Gas-Liquid Chromagraphy, 965
Dimensional (Infinite-) Algebras, *review* by Dr F Smithies, 201
5,6-Dimethylbenzimidazolylcobamide Coenzyme Structure of the (Dr P Galen Lenhert and Dorothy Crowfoot Hodgkin), 937
Dimethyldi-(4-hydroxyphenyl)-silane Allergy to a Carbon-Functional Organic Silicon Compound (Dr Sigfrid Fregert and Dr Hans Rorsman), 989
2,5-Dimethyl-Dithio-Furophthene, a Homologue of Thio-Thiophthene Crystal Structure of (Dr M Mammi, R Bardi, G Traverso and S Bezzi), 1282
Dimethylnitrosamine Counteraction by Cysteine of Glycogenolysis and Inhibition of Microsomal Protein Synthesis produced by (Dr P Emmelot and I J Mizrahi), 42
Dimmick, Dr R L, and others Free-Radical Formation during Storage of Freeze-dried *Serratia marcescens*, 776
Dineley, David Lawrence (Ball, Harold William, and) The Old Red Sandstone of Brown Clee Hill and the Adjacent Area, I, Stratigraphy (Bulletin of the British Museum (Natural History), Geology, Vol 5, No 7), 1250
Dingle, Prof Herbert The History of Science, *review*, 901
Dingwall, Dr E J A Survey of Extra-Sensory Perception, *review*, 4
2,4-Dinitrophenol Comparative Effects of, on the Actomyosin Adenosine Triphosphatase from Fresh, Frozen and Freeze-dried Beef (L J N Cole), 1288
Diniz, Dr Carlos R, and others A Micro-method for the Determination of Bradykininogen in Blood Plasma, 1194
Dioecy (Incipient), in Pimento (G P Chapman and S K Glasgow), 1205
Diogenes brevirostris Stimpson (Hermit Crab) Antennary Feeding of the (R E Boltt), 1099
Diorchis ransomi Schultze, 1940 (Cestode) Cell Reduction in the Embryonic Development of the (Krystyna Rybicka), 771
Diphenyl Crystal and Molecular Structure of (Dr G B Robertson), (August 5, 593), *erratum*, 1026
Diphenyl Compounds Evaluation of the Activity of some, on Winter Eggs of the Fruit Tree Red Spider (J Meltzer), 474
p-Diphenylbenzene X-Ray and Neutron Diffraction Examination of (Prof C J B Clews, Dr E N Maslen, H M Rietveld and T M Sabine), 154
Diphosphate (Adenosine), in Red Cells as a Factor in the Adhesiveness of Human Blood Platelets (A Gaarder, Dr J Jonsen, Prof S Laland, Dr A Hellem and Prof P A Owren), 531
Diphosphate (Cytidine), in the Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of (Dr J J Saukkonen), 816
Diphosphoglucose Dehydrogenase (Uridine), in Cartilage Histochemical Localization of (Dr Karoly Balogh, jun, and Richard B Cohen), 1199
Dipicolinic Acid Content, Heat-Activation and the Concept of Dormancy in the Bacterial Endospore (A Keynan, W G Murrell and Prof H O Halvorson), 1211
Diploid Nuclei (Haploid and) A Heterocaryon possessing (Chiyoko Takeichi and Prof Yonosuke Ikeda), 1317

Dipole Moment Heart Dipole Regions and the Measurement of (Dr M R Barber and Dr E J Fischmann), 141
Dipole Regions (Heart), and the Measurement of Dipole Moment (Dr M R Barber and Dr E J Fischmann), 141
Dipoles (Satellite Microwave) Long-Range Radio Communication by, 109
Dipropionate (Stilboestrol) Seminal Degeneration induced in Merino Rams by the Administration of (G R Moule and P E Mattner), 364
Dirac, Prof P A M Dirac's Cosmology and Mach's Principle, 441
Dirac's Cosmology (Dr C Gilbert), 57
Dirac's Cosmology and Mach's Principle (Prof R H Dicke), 440 , (Prof P A M Dirac), 441
Direct Current (Alternating Current and) Formation of Active Nitrogen using Sources of (G G Mannella), 159
Direct Measurement of Interplanetary Dust Particles in the Vicinity of Earth (C W McCracken, W M Alexander and M Dubin), 441
Direct Recording System (High-Speed), for Electron Diffraction (Dr C W B Grigson), 647
Disarray (Molecular), in a Crystal Lattice produced by a Fission Fragment (Dr F P Bowden and L T Chadderton), 31
Discontinuity (A Morning), in the Orientation of Quiet Auroral Arcs (Bengt Hultqvist, Alv Egeland and Georg Gustafsson), 956
Discovery The Journals of Captain James Cook on his Voyages of (edited by Dr J C Beaglehole), Vol 2, The Voyage of the *Resolution* and *Adventure*, 1772-1775, *review* by Prof R Firth, 1107
Disease Foot-and-Mouth, 714
  Immunization against, 20
Disease (Black Rod), caused by *Phytophthora palmivora* (Butl) Butl Probable Mechanism of Resistance of Varieties of Cocoa to (Dr John A Spence), 278
Disease (Chagas') in the Matalaque Region, Southern Peru Incidence of (Eleazar Cordova), 921
Disease (Chagas'), in the Village of Matalaque, Southern Peru Epidemiological Surveys on (Felix Naquira, Eleazar Cordova, Cesar Naquira and Enrique Rubin de Celia), 921
Disease (Fibrocystic), of the Pancreas Acetylcholine in Sweat in (Dr Edward L Eyerman, Dr Robert J Hurley and Dr Richard L Irwin), 77
Disease (Liver Glycogen) (Von Gierke's Disease) Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265 , (Dr David Yi-Yung Hsia), 266
Disease (Virus), in East Africa O'Nyong-nyong Fever, an Epidemic of, 30
Disease (Von Gierke's) (Liver Glycogen Disease) Blood Glycose-6-Phosphate in Heterozygous Carriers and Patients with (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265 , (Dr David Yi-Yung Hsia), 266
Disease Control (Communicable) The Role of Immunization in (United Nations, World Health Organization, Public Health Papers No 8), 20
Disease Virus (Foot-and-Mouth) Dissociation of, into its Nucleic Acid and Protein Components (F Brown and B Cartwright), 1163
Diseases (Acute Radiation) Problems of Infection, Immunity and Allergy in (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Diseases (Plant Pests and) Chemical Warfare on (W C Moore), 1140
Diseases (Virus) Research on the Chemotherapy of (Fine Chemicals Group of the Society of Chemical Industry Discussion on), 806
Dislocations as Active Centres in Heterogeneous Catalysis (Ituro Uhara, Sadao Yanagimoto, Kazuo Tani and Gin'ya Adachi), 867
Disney, H V Appointed managing director of the Engineering Group of the United Kingdom Atomic Energy Authority, 505 , work of, 505
Disorder (New Hereditary), of Amino-Acid Metabolism New Renal Tubular Amino-Acid Transport System and a (Dr C R Scriver, I A Schafer and M L Efron), 672
Displacement (Self-) Chromatography at Low Temperatures Purification of Hydrogen Isotopes by (Dr T R Phillips, D R Owens and A G Hamlin), 1067
Disposal Atomic Energy Waste—its Nature, Use and (edited by E Glueckauf), *review* by A W Kenny, 846
  Radioactive Waste, *review* by A W Kenny, 846
Dissecting Aneurisms of the Large Arteries of Chick Embryos due to (Sweet Pea) Lathyrism (Z Zahoř and M Machova), 532
Dissociating Conditions in Acid Solution Sedimentation of β-Lactoglobulin (*A*,*B*) under (Lilo M Gilbert and Dr G A Gilbert), 1181
Dissociation of Ethyl Halides in Self-quenching Geiger–Muller Counters Kinetics of (Prof I Zlotowski and H Wincel), 550
Dissociation of Foot-and-Mouth Disease Virus into its Nucleic Acid and Protein Components (F Brown and B Cartwright), 1163
Dissociation (Acidic), of 7 9-Dialkyl-guanines and its Possible Relation to Mutagenic Properties of Alkylating Agents (Dr P D Lawley and P Brookes), 1081
Distinct Clinico-Pathological Entity Establishment of Amoebic Hepatitis as a (Prof Th Doxiadis and Prof N Candreviotis), 988
Distinction between Bolting and Flowering Effects on Senescence (Prof Jules Janick and A C Leopold), 887
Distribution of *Deraeocoris olivaceus* Increase in (Dennis Leston and G E Woodroffe), 188
Distribution of Enzymes for oxidizing Thiocysteamine Detection and (D Cavallini, C De Marco and B Mondovi), 557
Distribution of *Gnetum* Structure, Life-History and, *review* by Dr C R Metcalfe, 1006
Distribution of Group-specific Components (*Gc*) in the Sera of Native Africans (Dr Jan Hirschfeld and Jean Sonnet), 766
Distribution of Haptoglobin Types in Israel (Dr Bracha Ramot, Poriya Zikert-Duvdevani and Gisela Tauman), 765
Distribution of the House Cricket, *Acheta domesticus* L Home and (Dr A S K Ghouri), 1000
Distribution of Intensity among various Ultrasonic Diffraction Orders (Dr C Raghupathi Rao), 220
Distribution of Permafrost in the Mackenzie River Delta Effect of a Lake on (G H Johnston and R J E Brown), 251
Distribution of Potassium in Baker's Yeast (Dr W McD Armstrong), 65
Distribution of Pressure for Flow of Gas through Porous Media (G J Field and Dr H Watts), 1277
Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the Central Nervous System of the Rat (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
Distribution of Trypsin Inhibitors in the Sera of various Animals (S Nakamura and T Wakeyama), 1077
Distribution (Counter-Current) Separation of Bacteria by (G David Baird, Per-Åke Albertsson and Bengt v Hofsten), 236
Distribution (Size), of Raindrops (V N Kelkar), 252
Distribution (World-wide), of Diurnal Variation of the Neutron Intensity of Cosmic Rays (Tsunekichi Kanno), 250
Distribution Analyser (Probability), programmed for Neurophysiological Research (Dr W R Levick, Prof P O Bishop, W O Williams and Prof D G Lampard), 629
Disturbed Days (Magnetically Quiet and) Diurnal Variation of High-Altitude Auroral Frequency on (Knut Lassen), 345
Ditmas, E M R The International Federation for Documentation, 218
Dittmer, Dorothy S (edited by) Blood and other Body Fluids (Analysis and compilation by Philip L Altman), *review* by Sir Hans Krebs, 591
Diuresis due to Stress in Cattle (R S Anderson), 460
Diuretic (A Non-) Benzothiadiazine with Anti-hypertensive Properties (Dr Alan A Rubin, Franklin E Roth and Martin M Winbury), 176 , *erratum*, 802
Diurnal Variation of High-Latitude Auroral Frequency on Magnetically Quiet and Disturbed Days (Knut Lassen), 345
Diurnal Variation of the Neutron Intensity of Cosmic Rays World-wide Distribution of (Tsunekicki Kanno), 250
Division (Cell) Importance of, for Antibody Production in an *in vitro* System (R W Dutton), 462
  Role of, in Gastrulation of the Viviparous Toothcarp *Xiphophorus helleri* (Prof A Stolk), 374
Dix, C H , and Wilshaw, W E Awarded the Leslie McMichael Premium of the British Institution of Radio Engineers, 609
Dixon, June Awarded a Fellowship in genetics in the University of Glasgow, 1132
Dmitrievsky, P M The Angara–Yenisei Hydroelectric Schemes, 114
Dobryszycka, W , and others Preparation and Determination of Sulpho-salicylo-soluble Proteins using Tannin, 262 , *erratum*, 802
Dobson, C , and others Precipitating Antibodies in the Carpet Snake against Parasitic Nematodes, 996
Dobzhansky, Prof T Polymorphism in Insects (Dynamics of Chromosomal Polymorphism in *Drosophila*), 413
Documentation, Fédération Internationale de Twenty-seventh Conference (E M R Ditmas), 218
  Inventory of Abstracting Services, 1026
Dodds, Sir Charles Chemistry in the Service of Medicine (Growth of Endocrinology and of Organic Chemistry), 1017
  Appointed chairman of the Governing Body of the Lister Institute, 1132
Dodecylbenzenesulphonate (Detergent) Action of a, on the Gills of the Trout (O J Schmid and H Mann), 675
Doell, Richard R , and Cox, Allan Palaeomagnetism of Hawaiian Lava Flows, 645
Dog Hearts Particle-bound and Free Catecholamines in, and the Uptake of Injected Norepinephrine (A Wegmann and K Kako), 978
Dogfish (Common) An Intra-Pericardial Hepatic Intrusion in the (Dr A S Fuller), 280
Dogiel, V A , and others Parasitology of Fishes (translated by Dr Z Kabata), *review* by Dr Ben Dawes, 832
Dogs Tests for Liver Dysfunction in (Celia M Hoe), 1045
Dolomite (Magnesite–) Sediments in South Australia Occurrence of (Prof A R Alderman and C C von der Borch), 861
Dolphins Simulated Wave-Riding (Byrne Perry, A J Acosta and Taras Kiceniuk), 148
Domestic Animals Anatomy and Histology of the Eye and Orbit in (Prof Jack H Prince, Prof Charles D Diesem, Prof Irma Eglitis and Gordon L Ruskell), *review* by Dr E N Willmer, 295
Domestic Food Consumption and Expenditure, 1959—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 317
Dominion Physical Laboratory, New Zealand Informal Symposium on Quantitative Biology, 25
Domzalski, Dr W Interpretation of Geophysical Surveys, 1244
Donaldson, Dr I S Gas Dynamics in the U S S R , *review*, 837
Donn, Dr A , and others Effect of Aldosterone on the Living Cornea *in vitro*, 73
Donohue, J (Sharma, Prof B D , and) Crystal Structure of 2-Phenylazulene, 863
Dopamine β Oxidase Inhibition of, by Adrenalone (Prof M Goldstein and J F Contrera), 1081
Dormancy in the Bacterial Endospore Dipicolinic Acid Content, Heat-Activation and the Concept of (A Keynan, W G Murrell and Prof H O Halvorson), 1211
Dormancy (Seed) Effect of Gibberellic Acid, Kinetin and other Substances on (B Frankland), 678
Dose (Cellular), and Age of Host in the Induction of Tolerance (Dr L Brent and Dr G Gowland), 1265
Dose-rate and Linear Energy Transfer Radiolysis of Liquid Acetone—Effect of (R Barker), 62
Doses (Lethal), of Carbon Tetrachloride Protection by Antioxidants against (Dr C H Gallagher), 881
Doses (Very Low) Multiplication of Mouse-adapted Influenza Virus in Mouse Lungs after Infection with (F Link and J Raus), 478
Dougherty, Dr Ellsworth C , and Solberg, Bjorn Axenic Cultivation of an Enchytraeid Annelid, 184
Doughty, Joyce Domestic Food Consumption and Expenditure (1959), 317
Douglas, A G (Carruthers, Dr W , and) 1,2-Benzanthracene Derivatives in a Kuwait Mineral Oil, 256
Douglas, James N , and Smith, Harlan J Presence and Correlation of Fine Structure in Jovian Decametric Radiation, 741
Douglas, Prof W W , and Poisner, A M Stimulation of Uptake of Calcium-45 in the Adrenal Gland by Acetylcholine, 1299
Douglas, Prof W W , and Rubin, R P Mechanism of Nicotinic Action at the Adrenal Medulla—Calcium as a Link in Stimulus-secretion Coupling, 1087
Douthwaite, Cynthia, and others Re-educative Treatment of Suppression Amblyopia (Being an abridged English version of Jean Sédan's 'Post Cure de l'Amblyope Rééduqué), *review* by Prof O L Zangwill, 695
Douzou, P Structure, Synthesis and Function of Deoxyribonucleic Acid (Electronic Aspects of Nucleic Acid Structure), 24

Downey, J W , and others α-Manganese Phases containing Technetium-99, 744
Downie, Prof A W Mechanisms of Virus Infections (Mechanisms of Virus Entry and Spread within the Host—Animal Viruses), 1246
Downie, Dr C , and others Classification of Fossil Microplankton, 471
Downing, A L Biochemical Engineering, 120
Doxey, D , and others Riboflavin and Liver Sulphydryl-Levels in Mice, 164
Doxiadis, Prof Th , and Candreviotis, Prof N Establishment of Amoebic Hepatitis as a Distinct Clinico-Pathological Entity, 988
Doyle, F P , and others New Penicillins Stable towards both Acid and Penicillinase, 1183
Doyle, Prof J Retirement from the chair of botany in University College, Dublin, 1238 , work of, 1238
Drayton, H A Inactivation of Rous Virus by Phospholipase A, 896
Drever, Dr H I , and others Ultrabasic Liquids, 157
Driver The Vehicle (British Occupational Hygiene Society Meeting on), 1245
Driving Stimulus Effects of Intensity of, on the Shape of Membrane Action Potential of the Heart (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Dronamraju, K R Awarded a Fellowship in genetics in the University of Glasgow 1132
Droop, M R Evidence for a Sexual Phase in the Life-Cycle of an Amoeba, 281, *erratum*, 507
Drosophila melanogaster Conversion of 2-^{14}C-Pteroyl-L-Monoglutamic Acid into Isoxanthopterin in (Dr J A Blair), 757
 Radiosensitive Stages in the Spermatogenesis of (V A Strangio), 781
Drowning and Histamine Stress Effects of Thymectomy on the Resistance of Rats to (Dr A S Weltman and A M Sackler), 460
Druce, C , and others Response of the Reticulo-Endothelial System to Stimulation with Œstrogens, 978
Drug (A New Prophylactic Trypanocidal), 2,7-di-(*m*-amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium Chloride Dihydrochloride (*M* & B 4596), (S S Berg, K N Brown, J Hill and W R Wragg), 367
Drugs in Nerves treated with Cetyltrimethylammonium Bromide Repetitive After-discharge produced by (Michiko Okamoto and Prof Albert S Kuperman), 365
Drugs (Antibacterial) Antagonism between (A Manten and W J Wisse), 671
Drugs (Synthetic) Antibiotics and the Newer (Bradford Chemical Society, the Department of Chemical Technology of the Bradford Institute of Technology, and the Yorkshire Council for Further Education Symposium on), 1132
Drummond, L J , and Rogasch, P E At the Third Australian Spectroscopy Conference (Spectral Characteristics of the Emission from Active Nitrogen–Chloroform and Active Nitrogen–Methylene Chloride Flames), 928
Dry Feeding (Wet and) Comparative Effects of, on the Utilization of Protein by Calves (A M Raven and K L Robinson), 1256
Dry-Matter Intake of Grazing Sheep A New Method of Estimating the, from their Faecal Output (J B Owen), 92
Dryden, Dr I G C Coal Science, 116
Dryden, J S , and Welsh, H K A Transition in the Dielectric Properties of Solid Secondary Alcohols, 255
Drying Technique Chromosome Preparation from Fresh and Cultured Tissues using a Modification of the (M Fox and Dr I M Zeiss), 1213
Drying (Freeze-) of Bovine Spermatozoa (R G Saacke and Prof J O Almquist), 995
du Bois, Dr C G B (von Knorring, Dr O , and) Carbonatitic Lava from Fort Portal Area in Western Uganda, 1064
Dubin, M , and others Direct Measurement of Interplanetary Dust Particles in the Vicinity of Earth 441
Duck (Eider) Life-Cycle of an Acanthocephalan Parasite of the (Dr C Rayski and E A Garden), 185
Duddington, Dr C L The Soil as an Environment for Animal Life 315 (Predacious Fungi and Soil Eelworms), 317
 Practical Microscopy, *review* by Dr S Bradbury, 904
Dudgeon, W Appointed senior lecturer in engineering at the University of Edinburgh, 507
Duffey, Dr E An Arachnological Anthology, *review*, 829
Dugger, jun , W M , and others Interaction of Light and Atmospheric Photochemical Products ('Smog') within Plants, 814
Dukes, Dr Cuthbert E (edited by) Cancer of the Rectum, *review* by Dr Francis J C Roe, 197
Dumonde, D C , and others Intracellular Response to an Iso-immune Reaction at the Surface of Ascites Tumour Cells 1302
Dunand, Prof G Education and Training on the Continent of Europe (Economic Mutual Penetration in Europe), 719
Dundas, P H Design of Laboratory High-Temperature Induction Furnaces, 114
Dunfermline Museum Opened by Dr D A Allan, 921
Dunn, P Conventional Methods of Converting Heat into Electricity (Basic Principles of the Thermionic Diode as an Energy Converter), 702
Dunn, Dr T M At the Third Australian Spectroscopy Conference (Results of a Rotational Analysis of the 2700 Å System of *para*-Difluorobenzene), 928
Dunsmore, J D Effect of Whole-Body Irradiation and Cortisone on the Development of *Ostertagia* spp in Sheep, 139
Dunworth, Dr J V Appointed deputy director of the National Physical Laboratory, 606 , work of, 606
Durie, Dr R A Third Australian Spectroscopy Conference, 927
Dust (Interplanetary), near the Earth (Prof S F Singer), 321
Dust (Lunar), and the Gegenschein (John C Brandt and Paul W Hodge) 957
Dust (Quartz) Formation of Histamine and Histamine-like Substances from Histidine by (L W Marasas), 872
Dust Particles (Interplanetary), in the Vicinity of Earth Direct Measurement of (C W McCracken, W M Alexander and M Dubin), 441
Dutch Institute of Engineers (Royal), (Society of Instrument Technology and the) Joint Conference on Measurement and Control Technology, 1241
Duthie, T Appointed Wilmot Breeden Fellow in the Department of Mechanical Engineering in the University of Birmingham, 406
Dutton, R W Importance of Cell Division for Antibody Production in an *in vitro* System, 462
Duyff, Prof J W , and others New Indirect Fick Procedure for the Determination of Cardiac Output, 760
Dwarf Coconut Palm Cytology and Origin of the (Dr M S Swaminathan and M C Nambiar), 85
Dwarf Groundsel Effect of Environment on the Responses of, to Gibberellic Acid (K H Basford), 992
Dwarfs (Hypopituitary) Growth Hormone Content of Serum in Infants, Children, Adults and (Dr J Girard, Dr M Vest and Dr N Roth), 1051
Dye-Protein Conjugates Purification and Concentration of, by Gel Filtration (Dr W George and Dr K W Walton), 1188
Dyes Behaviour of Protozoa under the Influence of the Synergetic Action of Polyethylene Glycol and (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Dynamic Organic Matter Cycle in Soils Aspects of the (Welsh Soils Discussion Group Discussion on), 309
Dynamic (Gas) Studies Bibliography of Tables and Charts for Use in (D E Randall), 308
Dynamics (Gas) Physical (edited by A S Predvoditelev), translated from the Russian by Dr R C Murray and D R H Phillips, *review* by Dr I S Donaldson, 837
Dynamics (Gas), in the U S S R *review* by Dr I S Donaldson, 837
Dysfunction (Liver), in Dogs Tests for (Celia M Hoe), 1045
Dystrophic Mice (Normal and Muscular) Excretion of Uncrystallized Urinary Calculi composed of Glycolipo-Protein by (C McGaughey), 1267
Dystrophic Mouse Muscle 5′-Adenylic Acid Deaminase in (Dr R J Pennington), 884

EABORN, Dr C Appointed professor of chemistry at the University College of Sussex, 18 , work of, 18
Eames, Prof E J , and the Morphology of the Angiosperms (Prof F C Steward), 8
Ear (Inner) Mode of Action of the Efferent Olivo-Cochlear Bundle on the (Dr J E Desmedt and Dr P Monaco), 1263
Earland, Dr C , and Raven, Dr D J Isolation of a Cystine Derivative from Silk, 1185
Earliest Times to the Present The Search for Order—the Development of the Major Ideas in the Physical Sciences from the (Cecil J Schneer), *review* by Prof Herbert Dingle, 901
Early Man Possible Origin of the Use of Fire by (D C Arnold), 1318
Early Test for Possible Skin Carcinogens (Olav Hilmar Iversen), 273
Earnshaw, A , and Larkworthy L F Structure of the Oxygen-carrying Cobalt (II) Histidine Complex, 1068
Earth Direct Measurement of Interplanetary Dust Particles in the Vicinity of (C W McCracken, W M Alexander and M Dubin), 441
 Errors in Orbital Predictions for Artificial Satellites of (Kenneth Moe), 151
 Interplanetary Dust near the (Prof S F Singer), 321
Earth Satellites Artificial (British Astronomical Association), 802
Earth's Magnetosphere Interaction of West Ford Needles with (Prof S F Singer), 303
 Interaction of West Ford Needles with the, and their Life-time (Prof S F Singer), 1061
Earth (Sun–) Relations and Associated Periodicities (Irvine Paghis), 346
Earths (Rare) Analytical Chemistry of the (Dr R C Vickery), *review* by Dr D T Lewis, 593
East Africa Age of the Basalt Flow at Olduvai (Prof G H R von Koenigswald, Prof W Gentner and H J Lippolt), 720
 O'Nyong-nyong Fever, an Epidemic of Virus Disease in, 30
East Africa High Commission East African Virus Research Institute Report (1959-1960), 30
East African Virus Research Institute Report (1959-1960), 30
Easterlin, Richard A , and others Population Redistribution and Economic Growth, United States, 1870-1950, *review* by Prof E Grebenik, 853
Eastern Grey Fox and the Eastern Raccoon Natural Occurrence of *Leptospira icterohaemorrhagiae* in the (Dr L G Clark, J I Kresse, R R Marshak and C J Hollister), 1312
Eastern Raccoon Natural Occurrence of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the (Dr L G Clark, J I Kresse, R R Marshak and C J Hollister), 1312
Eastmond, Dr G C , and others Effect of Mechanical Stress on some Solid-State Polymerizations, 1036
Eastwood, W (selected by) A Book of Science Verse, *review* by T R Henn, 98
Ebdon, R A Winds and Circulation in the Upper Atmosphere (Fluctuations in Tropical Stratospheric Winds), 13
Ebel, Prof J P , and others Conservation of the Biological Activity of a Soluble Ribonucleic Acid, 169
Ebner, Dr K E , and others Transamination and the Control of Mitochondrial Pathways, 820
Eboue, D , and others Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extracellular Glucose, 166
Eccles, Sir John Muscle Receptors (Central Connections of Muscle Afferent Fibres), (paper read by Prof A K McIntyre), 805
Echinochrome *A* Isolation of, from the Spines of the Sea Urchin, *Stomopneustes variolaris* (Lamarck), (Dr K Nishibori), 1293
Ecklonia radiata (Brown Alga) Seasonal Variation in Alginic Acid, Mannitol, Laminarin and Fucoidin in the (C M Stewart, H G Higgins and Sue Austin) 1208
Eclipse (Solar) Riometer Observations during a (M A Gordon), 249, *erratum*, 1132
Eco-Physiology (Plant) Methodology of (Botanical Institute, Montpellier, Symposium on), 1241
Ecological Branch of Russian Parasitology, *review* by Dr Ben Dawes, 832
Ecology (Experimental), of the Feeding of Fishes (Prof V S Ivlev), translated from the Russian by Douglas Scott, *review* by L Birkett, 297
Economic Co-operation and Development, Organization for (European Nuclear Energy Agency) Catalogue of Courses on Nuclear Energy in O E E C Countries (1961-1962), new edition, 405
Economic Growth Population Redistribution and, United States, 1870-1950 (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grebenik, 853

Eddington Memorial Lecture (Sir Cyril Hinshelwood), 115
Eddison, Roger Appointed director of operations of SIGMA (Science in General Management), Ltd, 115
Eddy, Nathan B, and others A New Potent Analgetic Antagonist, 1089
Edelhoch, H (Steiner, Dr R F, and) Influence of *pH* and Urea on the Ultra-violet Fluorescence of several Globular Proteins, 873
Edelmann, Abraham (edited by) Radioactivity for Pharmaceutical and Allied Research Laboratories—a Symposium sponsored by Nuclear Sciences and Engineering Corporation, *review* by Dr Hugh D Evans, 6
Education in Emergent Countries (Dr C E Beeby), 514
Education in Ghana Politics and, 1219
Education for Leadership, 587
Education in Physics Research and (International Atomic Energy Agency, Unesco and the Central Committee for Swedish Technical Assistance International Seminar on) 709
Education (Biological), in American Secondary Schools, 1890-1960 (Dr Paul De Hart Hurd), *review*, 1007
Education (Commercial and Industrial), British Association for Election of Sir Willis Jackson as president, 115
  Annual Conference (Education and Training on the Continent of Europe), 718
  Report on Education and Training in France, 920
Education (Further), Yorkshire Council for, and others Symposium on Antibiotics and Newer Synthetic Drugs, 1132
Education (Science, Technology and) United Kingdom Expenditure on, 1130
Education (University), in Ghana (Dr C T Mortimer), 14
Education Bill (Second reading in the House of Commons), 800
Education and Training on the Continent of Europe (British Association for Commercial and Industrial Education Conference on), 718
Education and Training in France (British Association for Commercial and Industrial Education Report on), 920
Edwards, G R, and Evans, [illegible] F Requirements of an Ice Nucleus, 448
Edwards, J A Laboratory Management and Techniques, *review* by E I Johnson, 854
Edwards Marcia A (edited by G Burder Stratton, assisted by) The Zoological Record, Vol 95, Records of Zoological Literature relating chiefly to the Year 1958, *review* by Dr Edward Hindle, 903
Edwards, R G Identification of the Chromosome Complements of New-born and Adult Living Mice 1316
Edwards, S F The Teaching of Quantum Mechanics, *review*, 1005
Effect of Age and Pregnancy on the Tolerance of Tsetse Flies to Insecticides (G F Burnett), 188
Effect of Aldosterone on the Living Cornea *in vitro* (Dr A Donn, Dr M G Rosenblatt and Dr N P Christy) 73
Effect of Auxin on the Osmotic Value in Pea Stem Sections (Shizuko Yoda and Joji Ashida), 577
Effect of Charcoal on the Behaviour of Adenine Nucleotides in Ion-Exchange Chromatography (U Pethiyagoda), 452
Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase (Jennifer Rothschild and Dr G F Howden), 283
Effect of Colchicine on Rat Liver Xanthine Oxidase (Dr Ottilia R Affonso, Emilio Mitidieri and Gilberto G Villela), 666
Effect of Copper on Products of Orcinol Oxidation (Dr T F Slater), 420
Effect of Copper Deficiency in White Clover on Nitrogen Fixation (F H van der Elst, K J McNaught and W F Rolt), 1315
Effect of Derivatives of L-Cysteine on Growth of *Leuconostoc mesenteroides* (8042), (A B K Njaa), 463
Effect of Dietary Ascorbic Acid on the Silkworm, *Bombyx mori* (Dr Toshio Ito) 951
Effect of Diethylstilboestrol on the Serum γ-Globulin in the Guinea Pig (L M Charles and Prof T Nicol), 565
Effect of Dose-rate and Linear Energy Transfer Radiolysis of Liquid Acetone— (R Barker), 62
Effect of Environment on the Responses of Dwarf Groundsel to Gibberellic Acid (K H Basford), 992
Effect of Feeding Griseofulvin on Rate of Growth of Chicks (Dr W P Jaffe), 469
Effect of γ-Radiation on *Escherichia coli* grown in Deuterium Oxide Medium (Ernest Pollard), 177
Effect of Gamma-Rays on Thymus Nucleoprotein in Solution (Dr A R Peacocke and Dr B N Preston), 228
Effect of Gibberellic Acid, Kinetin and other Substances on Seed Dormancy (B Frankland), 678
Effect of L-Glutamic Acid on the Weight of Embryonic Chick Tibiotarsi cultivated *in vitro* (Dr J D Biggers), 664
Effect of Hydrocortisone on Uptake of Iron-59 in Incubated Rat Red Cells *in vitro* (Peggy Clark), 667
Effect of Indole-3-Acetic Acid (IAA) on Phosphorus Metabolism in the *Avena* Coleoptile (A Sen Gupta and S P Sen), 1291
Effect of Insulin on Pathways of Glucose Oxidation in the Rat Lens (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075
Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extracellular Glucose (P Volfin, D Eboué and H Clauser), 166
Effect on the Ionosphere at Sodankyla Round-the-World Sound Waves produced by the Nuclear Explosion on October 30, 1961, and their (G Rose, J Oksman and E Kataja), 1173
Effect of Kinetin on the Fertility of some Strains of *Neurospora crassa* (Barry O Lee), 288
Effect of a Lake on Distribution of Permafrost in the Mackenzie River Delta (G H Johnston and R J E Brown), 251
Effect of Mechanical Stress on some Solid-State Polymerizations (Dr C H Bamford, Dr G C Eastmond and Dr J C Ward), 1036
Effect of 6-Mercaptopurine on Tumour Growth Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Effect of Monovalent Cations on the Blood Pressure of Intact and Hypertensive Rats (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Effect of Phagocytosis on the Lysis of *Staphylococcus aureus* (Type 81) by Bacteriophage (Dr J M McKenna and R P Sanderson), 570
Effect of a Phospholipid Factor on the Activity of Progesterone (Effect of Progesterone on Pregnancy), (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
Effect of Plant Growth Compounds on Uptake of Amino-Acids by Plant Roots (D E Wright), 1044
Effect of Progesterone Method of Administration and (Effect of Progesterone on Pregnancy), (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329
Effect of Progesterone on Pregnancy—Method of Administration and Effect of Progesterone (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329 , Effect of a Phospholipid Factor on the Activity of Progesterone (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
Effect of Pupal Brain Surgery on the Rocking Response of *Automeris* (Dr A D Blest) 373
Effect of Quinones on the Uptake of Oxygen by Red Cells (D Lovell and Dr T A J Prankerd), 561
Effect of Riboflavin on Liver Histomucoid (Luiz A Abreu and R Raposo Abreu), 261
Effect of Ribonuclease on Shell Regeneration of *Ariophanta* sp (K K Nair and P T Muthe), 674
Effect of Sheep Pituitary Extract on Hypercholesterolaemia in Intact and Hypophysectomized Rats (Dr Russel M Barakat), 71
Effect of some Smooth Muscle Stimulants on the Motor Response of the Isolated Guinea Pig Vas Deferens to Hypogastric Nerve Stimulation (Dr Nils O Sjostrand), 1190
Effect of Strong Electrical Fields on the Boiling Points of some Alcohols (Richard K Lyon), 1285 , (Dr P K Katti and M M Chaudhri), 1286
Effect of Temperature during Germination on the Crystalline Type of Starch in Soybean Seedlings (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
Effect of Temperature on the Strain Recovery in Wood (Maciej Lawniczak and Jan Raczkowski), 583
Effect of Temperature and Potassium Gibberellate on Phases of Growth of Algerian Ivy (J R Goodin and Prof V T Stoutemyer), 677
Effect of Ultra-Violet Radiation and Desiccation on Different Age-Cultures of *Escherichia coli K*12 (I L Mulay and G S Sperti), 773
Effect of Urea Ingestion on Parotid Salivation in Sheep (A D Wilson), 271
Effect of Water Movement on Salt Movement through Tomato Roots (William Lopushinsky and Paul J Kramer), 994
Effect of Whole-Body Irradiation and Cortisone on the Development of *Ostertagia* spp in Sheep (J D Dunsmore), 139
Effect of X-Irradiation on Self-Stimulation of the Brain (Dr Thomas J Haley, P Bach-y-Rita and N Komesu), 1309
Effect (Anti-Asthmatic), of Phenazone and Amidopyrine (H Herxheimer and E Stresemann), 1089
Effect (Crabtree), in Rous Sarcoma Cells Ultrastructural Alterations during the (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
Effect (Cytopathic) Serial Propagation of Types 1, 2, 3 and 4 Dengue Virus in HeLa Cells with Concomitant (Sonja M Buckley), 778
Effect (Cytotoxic), of Aminoacetonitrile on Fibroblast Cultures and its Prevention by Histidine (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Effect (de Haas–van Alphen), in InBi (A C Thorsen and T G Berlincourt), 959
Effect (Enhanced), of Total-Body X-Irradiation in Mice under Mild Hypothermia (Dr H J G Bloom and K B Dawson), 232
Effect (Faraday Magneto-Optical) A New Application of the, for Diagnostic Measurements of Transient Magnetic Fields (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Effect' ('Glycerol), and the Mechanism linking Excitation of the Plasma Membrane with Contraction (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
Effect (Mossbauer) Method of Measuring the (Dr J E S Bradley and J Marks), 1176
Effect (Paradoxical), of Phlorizin on Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* (Dr Stanton Segal Alberta Blair and Leon E Rosenberg), 1085
Effect (Pituitary), on Synthesis of Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Effective Contact Stresses and Friction (Dr D H Trollope), (July 22, 376), *errata*, 213
Effects of an Amphetamine–Barbiturate Mixture Modification of the, by the Past Experience of Rats (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson), 533
Effects of 7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide on Mitochondria from Rat Liver and Brain (Bernhard Kadenbach and Prof Walter Luhrs), 174
Effects of Climate on Vegetation, *review* by Prof G Manley, 5
Effects of 2-Diethylaminoethyl 2,2-Diphenylpentanoate (SKF 525A) on Insecticidal Potency (P S Hewlett, C J Lloyd and Angela N Bates), 1273
Effects of Electrical Stimulation of Recticular Formation on the Lactic Acid Content of the Rat Brain (Dr Lj Mihailovic, Lj Krzalić and D Cvetković), 1166
Effects of Intensity of Driving Stimulus on the Shape of Membrane Action Potential of the Heart (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the Electrical Activity of the Cat Brain (Dr Lj Mihailović and Dr B D Jankovic), 665
Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radio-sensitive Organs in Rats exposed to X-Rays (Dr M Quintiliani, M Boccacci and L Tentori), 573
Effects of Irradiation on the Incorporation of Amino-Acid into Normal and Regenerating Rat Liver (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Effects of the Sulphur Amino-Acids on the Vitamin A Content in Liver of Rats (Tatsuo Koyanagi and Satoshi Odagiri), 168
Effects of Thymectomy on the Resistance of Rats to Drowning and Histamine Stress (Dr A S Weltman and A M Sackler), 460
Effects (Buoyancy) Vortex Shedding from the End of a Tube as a Result of (A A Putnam), 1277

Effects (Comparative), of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from Fresh, Frozen and Freeze-dried Beef (L J N Cole), 1288
Effects (Comparative), of Wet and Dry Feeding on the Utilization of Protein by Calves (A M Raven and K L Robinson), 1256
Effects (Delayed), of Whole-Body Radiation—a Symposium jointly sponsored by the Operations Research Office and the Walter Reed Army Institute of Research (edited by Bernard B Watson), *review* by Dr Hugh D Evans, 6
Effects (Flowering), on Senescence A Distinction between Bolting and (Prof Jules Janick and A C Leopold), 887
Effects (Hypertensive), of Bradykinin in Rats (H Croxatto and J Belmar), 879
Effects (Lethal), of X-Rays Protection by Inorganic Condensed Phosphates against the (J H Barnes and J St L Philpot), 574
Effects (Pharmacodynamical), of Asarone and *β*-Asarone (J D Sharma, Dr P C Dandiya, Dr R M Baxter and Dr S I Kandel), 1299
Effects (Possible Solar Flare), in the *F* Region of the Ionosphere (Dr G H Munro), 347 , (Dr R W Knecht and Dr K Davies), 348
Effects (Radiation), on Lithium-doped Nickel Oxide Catalysts in Carbon Monoxide Oxidation (T Braun and I Maxim), 548
Effects (Radioprotective), of Reserpine and its *N*-oxide (Dr Thomas J Haley, A M Flesher and L Mavis), 1309
Effects (Stress Concentration), in Tertiary Creep (Dr P W Davies and B Wilshire), 1281
Effects (Visual), of Non-Redundant Stimulation (Prof D M MacKay), 739
Efferent Olivo-Cochlear Bundle Mode of Action of the, on the Inner Ear (Dr J E Desmedt and Dr P Monaco), 1263
Efron, M L , and others New Renal Tubular Amino-Acid Transport System and a New Hereditary Disorder of Amino-Acid Metabolism, 672
Egeland, Alv, and others A Morning Discontinuity in the Orientation of Quiet Auroral Arcs, 956
Egg (Hen) White, Oviduct White, Yolk, Ova and Serum Proteins Starch Gel Electrophoresis of (Dr F Steven), 972
Eggleton, A E J , and Thompson, N Loss of Fluorescent Particles in Atmospheric Diffusion Experiments by Comparison with Radioxenon Tracer, 935
Eggleton A E J , and others Isotopic Composition of Atmospheric Hydrogen and Methane, 649
Eggleston, Prof H G *Obituary* of Prof W N Bailey, 917
Eggs (Winter), of the Fruit Tree Red Spider Evaluation of the Activity of some Diphenyl Compounds on (J Meltzer), 474
Eglinton, Dr Geoffrey The Fatty Acids, *review*, 199
Eglitis, Prof Irma, and others Anatomy and Histology of the Eye and Orbit in Domestic Animals, *review* by Dr E N Willmer, 295
Ehrlich Ascites Carcinoma in Mice Action of Deoxyribonuclease and Ribonuclease on the Growth of (Dr Gaston de Lamirande), 52
Eider Duck Life-Cycle of an Acanthocephalan Parasite of the (Dr C Rayski and E A Garden), 185
Eight-Co-ordinate Diarsine Complexes of Quadrivalent Metal Halides (Dr R J H Clark, Dr Jack Lewis, Prof R S Nyholm, Dr Peter Pauling and Dr G B Robertson), 222
Eimeria in Tissues Limitations of the Periodic Acid–Schiff Technique for the Demonstration of Stages of (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Eisenia bicyclis Structural Investigation of a Laminaran isolated from (Nobuhiko Handa and Prof Kazutosi Nisizawa), 1078
Eisinger, J , and others Relaxation Enhancement by Paramagnetic Ion Binding in Deoxyribonucleic Acid Solutions, 963
Ekins, R P (Banerjee, Dr R N , and) A Simple Microdiffusion Technique for the Radioiodination of Proteins, 746
Eklund, Dr Sigvard Appointed director-general of the International Atomic Energy Agency, 115
Elastic System (Air-filled) Oscillatory Flow in an (Group-Capt J E Malcolm), 875
Elberg, Dr Sanford S (Aronson, Dr Moshe, and) Detection of Inclusion Bodies containing Deoxyribonucleic Acid by means of Autoradiography, 981
Elden, Dr H R , and Webb, G Extendability of Tendons undergoing Contraction–Relaxation, 742
Eldred, E Muscle Receptors (Cerebral Influences), 805 , (Spindle Numbers and Distribution), 806
Electric Fields (High) Electrical Conductivity of Calcium Oxide at (Dr C H B Mee), 350
Electric Resonance (Magnetic and), and Relaxation (Netherlands Physical Society and the *Groupement Ampere* International Conference on), 213
Electrical Activity of the Cat Brain Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the (Dr Lj Mihailovic and Dr B D Jankovic), 665
Electrical Activity of Single Cells (edited by Yasuji Katsuki), *review* by Dr P Fatt, 203
Electrical Conductivity of Calcium Oxide at High Electric Fields (Dr C H B Mee), 350
Electrical Engineering at Manchester, 403
Electrical Engineering or Physics Research Scholarships in (British Broadcasting Corporation), 115
Electrical Engineers, American Institute of David Sarnoff Award in Electronics presented to Dr C H Townes, 606
Electrical Engineers, Institution of Conference on Microwave Measurement Techniques, 408
Electrical Fields (Strong) Effect of, on the Boiling Points of some Alcohols (Richard K Lyon), 1285 , (Dr P K Katti and M M Chaudhri), 1286
Electrical Power Convention British, 500
Electrical Power Development (A J Ellison), 500
Electrical Stimulation of Reticular Formation Effects of, on the Lactic Acid Content of the Rat Brain (Dr Lj Mihailovic, Lj Krzalić and D Cvetković), 1166
Electrical Surface Potential of Red Blood Cells Agglutination and the (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Electrical and Allied Industries Research Association (British) Appointment of L H Welch as industrial relations consultant, 115
Electricity Christmas Lectures at the Royal Institution on (Sir Lawrence Bragg), 1026
  Conventional Methods of Converting Heat into (British Association for the Advancement of Science, Section A (Mathematics and Physics) and Section G (Engineering), Joint Discussion on), 701
  Thermionic Conversion of Heat to (R V Harrowell), 611
  Thermionic Generation of (Central Electricity Generating Board Symposium on), 611
Electricity Generating Board (Central) Symposium on the Thermionic Generation of Electricity, 611
Electrodes (Glass) Elimination of the Liquid Junction by using (Carl R Merril), 1087
Electrodynamics of Continuous Media (L D Landau and E M Lifshitz), translated from the Russian by J B Sykes and J S Bell, *review* by Dr B H Chirgwin, 389
Electrodynamics and Mechanics, *review* by Dr B H Chirgwin, 389
l'Électrodynamique Quantique Introduction a (Prof Daniel Kastler), *review* by Dr P Roman, 1111
Electrolyte Excretion in Sheep Hormones and (R Kinne, Dr W V Macfarlane and Prof O E Butdz-Olsen), 1084
Electrolytes and Plant Cells (Prof G E Briggs, Dr A B Hope and Prof R N Robertson), *review* by Dr James F Sutcliffe, 831
Electrolytic Desalters Hydrolysis of Hippuric Acid in (Dr E McEvoy-Bowe), 1072
Electrolytic Manufacture of Chemicals from Salt (Dr D W F Hardie), *review* by Dr M J Newlands, 902
Electrolytic Systems Evaluation of Boundary Layer Thickness in, from Decay of Anode Concentration Polarization (Leonard Nanis), 449
Electromagnetic Measurements Precision (United States National Bureau of Standards 1962 International Conference on), 922
Electron Density (*F*-Region), with Sunspot Number Atmospheric Scale Height as a Modifying Influence on Linear Trend of (Jean M Bullen), 542
Electron Diffraction High-Speed Direct-Recording System for (Dr C W B Grigson), 647
Electron Impact Excitation of the 2*s* State of Atomic Hydrogen by (Dr B L Moisiewitsch), 545
  Experimental Detection of Auto-Ionizing Transitions in Krypton by (John F Burns), 651
Electron Micrographs Estimation of Mass Thickness of Biological Samples from their (M L De), 546
Electron Microscope Investigation with the, of the Sublimation of Ice Crystals at Low Temperatures (Prof Tokio Nei), 1177
Electron Microscope Society of America Nineteenth Annual Meeting, 610
  Symposium on the Contribution of Electron Microscopy to Polymer Morphology, 610
  Symposium on Ultrastructure of Protein Fibers—Collagen, Muscle and Keratin, 610
  Symposium on the Fine Structure of Viruses, 611
Electron Microscopy, *review* by Prof R D Preston, 1220
  Contribution of, to Polymer Morphology (Electron Microscope Society of America Symposium on), 610
  Fifth International Congress for, 611
  Histological Techniques for (Daniel C Pease), *review* by Dr V E Cosslett, 5
  Histology and, *review* by Dr V E Cosslett, 5
  Proceedings of the European Regional Conference on (Delft, 1960), (edited by A L Houwink and B J Spit), *review* by Prof R D Preston, 1220
Electron Microscopy in the United States (Dr A R Taylor), 610
Electron Paramagnetic Resonance and Antiferromagnetism in $LaCrO_3$ (L Weinberg and P Larssen), 445
Electron Spin Resonance (Chemical Society Symposium on), 1034
Electron-Spin Resonance Signals from Lyophilized Bacterial Cells exposed to Oxygen (Dr M B Lion, Dr J S Kirby-Smith and Dr M L Randolph), 34
Electronic Outline of Organic Chemistry (Dr S Horwood Tucker), *review* by Dr Neville H P Smith, 7
Electronics The International Dictionary of Physics and, second edition, *review* by J R Tillman, 1111
Electronics (David Sarnoff Award in) of the American Institute of Electrical Engineers presented to Dr C H Townes, 606
Electrons (4-MeV) Production of High Molecular Weight Products from the Irradiation of Methane with (R W Hummel), 1178
Electrophoresis Paper (L P Ribeiro, E Mitidieri and Dr O R Affonso), *review* by Dr G V F Seaman, 593
Electrophoresis (Starch-Gel) Comparison of the Serum Protein Fractions of the Developing Chicken Embryo by the Technique of (A Amin), 356
  Resolution of Pathological Human Gamma-Globulins by (J P Binette and K Schmid), 732
Electrophoresis (Starch Gel) of Hen Egg White, Oviduct White, Yolk, Ova and Serum Proteins (Dr F Steven), 972
Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins O and S in Agar-gel (Extracellular Esterase of Group *A* Streptococci), (A H Stock and José Uriel), 435
Electrophoretic Separation of Conjugated Bilirubin on Paper (Dr E Talafant), 972
Electro-physiology of Thermoreceptors (Prof Herbert Hensel), 309
Electrostatic Forces Gravitational and (Dr A E Martin), 59
Electrostatic Machine A Novel—the Corona Motor (J D N Van Wyk and G J Kuhn), 649
Electrotechnology in Australia, 608
Elementary Logic of Science and Mathematics (Dr P H Nidditch), *review* by Prof R L Goodstein, 856
Elements of Functional Analysis (L A Liusternik and V J Sobolev), translated from the Russian by Anthony E Labarre, Jr , Herbert Izbicki and H Ward Crowley, *review* by Dr J C Burkill, 491
Elements of Maser Theory (Arthur A Vuylsteke), *review* by Dr J H Sanders, 202
Eley, Prof D D Phospholipids and Sulpholipids, 807
  Introduction to a Submolecular Biology, *review*, 853
Eliassen, Dr Einar Changes of Blood Volume in the Pre-Hibernating and Deep-Hibernating Hedgehog, 1047
Eliassen, Dr Einar, and Leivestad, Helge Sodium and Potassium Content in the Muscles of Hibernating Animals, 459
Elkin, Prof A P Awarded the Herbert E Gregory Medal of the Bernice P Bishop Museum, Honolulu, 21
Elimination of the Liquid Junction by using Glass Electrodes (Carl R Merril), 1087
Ellice, J M , and others O'Nyong-nyong Fever, 30

Elsevier's Dictionary of Automation, Computers, Control and Measuring, in Six Languages, English/American, French, Spanish, Italian, Dutch and German (compiled and arranged on an English alphabetical base by W E Clason), *review* by S Whelan, 904
Elsworth, R Biochemical Engineering, 120
Elworthy, Dr P H, and McIntosh, Dr D S Phospholipids and Sulpholipids (Light Scattering of Lecithin), 808
Embolism Syndrome (Acute Aortic), in Cats Production of Aortic Occlusion resembling (Roy K Imhoft), 979
Embrittlement of Grain Boundaries by Equilibrium Segregation (J H. Westbrook and D L Wood), 1280
Embryo (Developing Chicken) Comparison of the Serum Protein Fractions of the, by the Technique of Starch-Gel Electrophoresis (A Amin), 356
Embryo Erythrocytes (Chick) Number of Re-Circulations of (L Lemez and Z Rychter), 1298
Embryonal Sex Ratio (Primary), in Normal Pregnancies determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch Méhes), 476
Embryonic Chick Tibiotarsi cultivated *in vitro* Effect of L-Glutamic Acid on the Weight of (Dr J D Biggers), 664
Embryonic Development of the Cestode *Diorchis ransomi* Schultze, 9140
  Cell Reduction in the (Krystyna Rybicka), 771
Embryos (Chick) Dissecting Aneurisms of the Large Arteries of, due to (Sweet Pea) Lathyrism (Z Zahoř and M Machova), 532
  Localization of Inhibitors of Neural Differentiation in (Dr A K Katoh), 997
Embryos (Excised), of *Avena fatua* L Bioassay of Gibberellic Acid using (Prof J M Naylor and G M Simpson), 679
Emergence of Resistance Biological Spectrum of some New Tuberculostatic 1,3,4-Oxadiazolones with special reference to Cross-Resistance and Rates of (Prof A E Wilder Smith and Hans Brodhage), 1195
Emergent Countries Education in (Dr C E Beeby), 514
Emission of Ultra-Violet and Visible Radiation from Metals by the Impact of High-Energy Hydrogen Ions (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Emission (Polarized Thermal), from Narrow Tungsten Filaments (Prof Yngve Öhman), 254
Emmelot, Dr P, and Mizrahi, I J Counteraction by Cysteine of Glycogenolysis and Inhibition of Microsomal Protein Synthesis produced by Dimethylnitrosamine, 42
Emulsion (Melted Nuclear) Autoradiography using (Dr A C Kulangara), 437
Encephalitis Virus (Tick-borne) Reproduction of, in HeLa Cells (Dr H Libíkova and Dr P Albrecht), 779
Enchytraeid Annelid Axenic Cultivation of an (Dr Ellsworth C Dougherty and Bjørn Solberg), 184
l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture Institut pour (Bruxelles) Rapport Annuel Exercice (1960), 28
Encouragment of Scientific Research in Industry and Agriculture, Institute for the (Brussels) Annual Report for 1960, 28
Encyclopedia of Microscopy (edited by Prof George L Clark), *review* by Dr R Barer, 833
End of a Tube Vortex Shedding from the, as a Result of Buoyancy Effects (A A Putnam), 1277
d'Endocrinologie Études—Séminaires 1960 de la Chaire de Morphologie Experimentale et Endocrinologie du Collège de France (dirigés par le Prof Robert Courrier), *review* by Sir Solly Zuckerman, 834
Endocrinology Studies in, *review* by Sir Solly Zuckerman, 834
Endocrinology and Evolution (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 796
Endospore (Bacterial) Dipicolinic Acid Content, Heat-Activation and the Concept of Dormancy in the (A Keynan W G Murrell and Prof H O Halvorson), 1211
Energy New Sources of (United Nations Conference on), 407
Energy in Nuclear Fission The Balance of (G N Walton), 1062
Energy Conversion Unconventional Methods of (Prof D A Wright), 701
Energy (Activation), in Solid State Reactions Definition of Rate Constant and (W Gomes), 865
Energy (High-) Hydrogen Ions Emission of Ultra-Violet and Visible Radiation from Metals by the Impact of (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Energy (Low-) Nuclear Physics Accelerators for, 1239
Energy (14 MeV Neutron) The Reaction Silicon-29 (n,α) Magnesium at (Dr W M Deuchars and G P Lawrence), 1278
Energy-Level Model for High-Resistivity Gallium Arsenide (J Blanc and L R Weisberg), 155
Energy Transfer (Linear) Radiolysis of Liquid Acetone—Effect of Dose-rate and (R Barker), 62
Engel, W F, and others Oxidation Processes in Chemical Manufacture (Recent Developments in the Oxidation Recovery of Chlorine from Hydrochloric Acid), 1135
Engen, G F Microwave Measurement Techniques (A Survey of Microwave Power Measurement Techniques employed at the National Bureau of Standards, U S A), 409
Engineering Biochemical (Institution of Chemical Engineers Symposium on), 119
Engineering Achievement (British) B B C—a, second edition (British Broadcasting Corporation), 1240
Engineering Study and Fundamental Research in Plastics Fellowships in (Princeton University), 921
Engineering and Television, 1240
Engineering (Biological) Society Election of Officers, 507
Engineering (Electrical), at Manchester, 403
Engineering (Electrical), or Physics Research Scholarships in (British Broadcasting Corporation), 115
Engineering (Marine) Denny Scholarship in, (1961) awarded by the Royal Institution of Naval Architects to David K Brown, 309
  Parsons Scholarship in, (1961) awarded by the Royal Institution of Naval Architects to Alan B Turner, 309
Engineering (Municipal), at Manchester, 403
Engineers, Royal Dutch Institute of (Society of Instrument Technology and the) Joint Conference on Measurement and Control Technology, 1241
Engineers (Chemical), Institution of Symposium on Biochemical Engineering, 119
Engineers (Electrical), American Institute of David Sarnoff Award in Electronics presented to Dr C H Townes, 606
Engineers (Electrical), Institution of Conference on Microwave Measurement Techniques, 408
Engineers (Nuclear) Materials for (edited by Dr A B McIntosh and T J Heal), *review*, 392
Engineers (Radio), British Institution of Clerk Maxwell Premium awarded to Dr G T Wright, 609
  Heinrich Hertz Premium awarded to R A Waldron, 609
  A F Bulgin Premium awarded to Dr A Kraus, 609
  Arthur Gay Premium awarded to E Davies, 609
  Leslie McMichael Premium awarded to C H Dix and W E Wilshaw, 609
  Lord Rutherford Award awarded to E C Fellows, 609
  Charles Babbage Award awarded to E M Bradley, 609
Engineers (Scientists and), in the Federal Government, October 1958 (United States National Science Foundation), 800
Engle, J L (Freed, J J, and) Scanning Techniques in Biological and Medical Microscopy (Advantage of using a Vibrating Mirror to produce the Scan), 1031
Engledow, Sir Frank Cotton-Growing in Nigeria, 1248
English Community Diabetes in an (Dr Joan B Walker and David Kerridge), *review*, 391
English and Continental Medieval Glazed Pottery A Spectroscopic Survey of (L C Thomas and J W G Musty), 1143
Enhanced Effect of Total-Body X-Irradiation in Mice under Mild Hypothermia (Dr H J G Bloom and K B Dawson), 232
Enhancement of Steroidogenesis by Rat Adrenal Slices *in vitro* with Œstradiol-17-β (Prof Julian I Kitay), 358
Enhancement (Relaxation), by Paramagnetic Ion Binding in Deoxyribonucleic Acid Solutions (J Eisinger, R G Shulman and W E Blumberg), 963
Entamoeba histolytica Antigenic Structure of (A Sen, S N Ghosh, S Mukerjee and J C Ray), 893
Enterohepatic Circulation of Bilirubin (Roger Lester, J Donald Ostrow and Prof Rudi Schmid), 372
Entity (Clinico-Pathological) Establishment of Amoebic Hepatitis as a Distinct (Prof Th Doxiadis and Prof N Candreviotis), 988
Entomological Society (Royal) Symposium on Polymorphism in Insects, 412
Entomology Medical (Dr William B Herms and Dr Maurice T James), fifth edition, *review* by Prof D S Bertram, 298
Entry of Fission Products into Food Chains (edited by J F Loutit and R Scott Russell), *review* by Dr Hugh D Evans, 6
Environment Effect of on the Responses of Dwarf Groundsel to Gibberellic Acid (K H Basford), 992
  Flagellar Changes in *Escherichia coli* induced by Temperature of the (Dr Robert B Morrison and Jean McCapra) 774
Environment in Ancient Seas Life and its (British Association for the Advancement of Science, Section C (Geology) and Section D (Zoology), Joint Discussion on), 925
Environment for Animal Life The Soil as an (British Association for the Advancement of Science, Section D (Zoology), Symposium on), 315
Environment (Larval) Influence of, on Adult Size and Fecundity in the Moth *Panaxia dominula* L (L M Cook), 282
Environmental Radioactivity Report of the Steering Committee for Nuclear Energy and Council Decision on the Establishment of a Supervision and Emergency Warning System in Cases of Increase in (Organization for European Economic Co-operation), 31
Enzymatic Hydrolysis of Biliary Conjugates of 3,4-Benzpyrene on Filter Paper (Dr Hans L Falk, Sung Suk Lee and Prof Paul Kotin), 973
Enzyme (Condensing), and Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, (Jennifer Rothschild and Dr G F Howden), 283
Enzyme (Malic), in *Lactobacillus arabinosus* (17-5) Nutritional Requirements for the Induced Formation of (Sheila M Bocks), 89
Enzyme (Wheat Leaf) Oxidative Decarboxylation of Indole-3-acetic Acid by Mangani-Versene and by (Prof R A Abramovitch and K S Ahmed), 259
Enzyme Deficiency (Red Cell) Absence of, in Australian Aborigines (Prof O Budtz-Olsen and Dr Chev Kidson), 765
Enzyme Histo- and Cyto- Chemistry Use of Tetrazolium Compounds in Oxidative (Prof C G Rosa and Kwan-Chung Tsou), 990
Enzyme System (Acetylating), from Pigeon Liver Inactivation of A-Methopterin by the (V Krishnamurthy and Beatriz M Braganca), 68
Enzymes The (edited by Paul D Boyer, Henry Lardy and Karl Myrbäck), Vol 2, Purine and Pyrimidine Nucleotides and Phosphagens, Prosthetic Groups and Cofactors (part A) second edition, Vol 3, Prosthetic Groups and Cofactors (part B), Vol 4, Hydrolytic Cleavage (part A), second edition, *review* by Dr Edwin C Webb, 1109
Enzymes for oxidizing Thiocysteamine Detection and Distribution of (D Cavallini, C De Marco and B Mondovi), 557
Enzymes (Thyroid) Proteolysis of Thyroglobulin by (Dr Mary T McQuillan, J D Mathews and Prof V M Trikojus), 333
Enzymes and Cancer, *review* by Dr L H Stickland, 100
Enzymes in Cancer Chemistry of (Prof Franz Bergel), *review* by Dr. L H Stickland, 100
Enzymic Inactivation of Trichothecin and Crotocin (Dr I Horvath and J M Varga), 88
Enzymology and related Subjects of Biochemistry Advances in (edited by F F Nord), Vol 22, *review* by Dr E C Webb, 854
Eosinophils (Tissue), and Peroxidase Activity Relationship between (Tapio Rytomaa and Prof Harald Teir), 271

Fatty Acids of Montan Wax Separation, Identification and Determination of the (D R Hewett, P J Kipping and P G Jeffery), 65
Fatty Acids in Rabbit-Heart Sarcosomes Relationship between Oxidation of Isocitrate and Metabolism of (Dr W C Hulsmann), 1153
Fatty Acids (Essential) Requirement of, and Avian Atherosclerosis (H Fisher, A S Feigenbaum and H S Weiss), 1310
Fatty Acids (Unesterified) Improved Gas Chromatography of (P Jowett and B J Horrocks), 966
Fauna (A Mammalian), from the Kimmeridgian of Portugal (Dr Walter G Kuhne), 274

Fauna (World's), for Food The Better Use of the (Institute of Biology Symposium on), 21, 1112
Fecundity in the Moth *Panaxia dominula* L Influence of Larval Environment on Adult Size and (L M Cook), 282
Federal Council for Science and Technology, 1023
Federal Government Scientists and Engineers in the, October 1958 (United States National Science Foundation), 800
Fédération Internationale de Documentation Twenty-seventh Conference (E M R Ditmas), 218
  Inventory of Abstracting Services, 1026
Feeding of Bamboo Flowers to Laboratory Rats and Mice (V Mahadevan, Dr S S Negi and O N Agarwala), 470
Feeding of Fishes Experimental Ecology of the (Prof V S Ivlev), translated from the Russian by Douglas Scott, *review* by L Birkett, 297
Feeding Griseofulvin Effect of, on Rate of Growth of Chicks (Dr W P Jaffe), 469
Feeding Mechanism of the Flea An Apparatus for Observations on the (M M J Lavoipierre and M Hamachi), 998
Feeding (Antennary), of the Hermit Crab *Diogenes brevirostris* Stimpson (R E Boltt), 1099
Feeding (Plant), in Mosquitoes Specificity of, as determined by Radioactive Phosphorus (Dr A A Abdel-Malek and Dr W F Baldwin), 178
Feeding (Wet and Dry) Comparative Effects of, on the Utilization of Protein by Calves (A M Raven and K L Robinson), 1256
Feeding Habit of some Central African Freshwater Fishes (H Matthes), 78
Feigenbaum, A S, and others Requirement of Essential Fatty Acids and Avian Atherosclerosis, 1310
Feilden, G B R Appointed a member of the Council for Scientific and Industrial Research, 113
Feinberg Dr Joseph G A 'Microspot' Test for Antigens and Antibodies, 985
Feldberg Foundation Lecture 1961 (Prof Herbert Hensel, The Electrophysiology of Thermoreceptors), 309
Fellows, E C Awarded the Lord Rutherford Award of the British Institution of Radio Engineers, 609
Fellowship Perkin Centenary (Perkin Centenary Trust), 506
Fellowships in Engineering Study and Fundamental Research in Plastics (Princeton University), 921
Fellowships (Research), and Research Studentships Senior Research Fellowships, (Zoological Society of London), 211
Fellowships (Senior Research), in Clinical Research (Wellcome Trust), 1026
Fellowships (Senior Research), of the New Zealand Department of Scientific and Industrial Research awarded to Dr B H Howard and to Dr R Melville, 210
Fellowships (Senior Research), Research Fellowships and Research Studentships (Zoological Society of London) 211
Female Rat Preputial Glands as a Source of / -Glucuronidase (Dr Margaret I Stern), 359
Female White Rat during the Œstrual Cycle Variations in the Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the (E Brañez and H Roels), 1043
Females of *Gryllus assimilis* (F) Inhibited Oviposition by, induced by Radioactive Males, using L-Methionine-Methyl-^{14}C (Dr A A Abdel-Malek and D K McE Kevan), 681
Fenner, Prof F J Mechanisms of Virus Infections (Epidemiological Factors in relation to Animal Virus Diseases), 1247
Ferguson, Dr K M Endocrinology and Evolution, 796
Fermentation (Antibiotic) A Potent, Non-Toxic Plant-Growth Inhibitor from an (Dr L G Nickell and W D Celmer), 1098
Fermentation Liquors Formation of 2,3-Dihydroxybenzoic Acid in, during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall (F Arcamone, Prof E B Chain, A Ferretti and P Pennella,, 552
Ferrando, Prof R, and others Œstrogen Content of Plants as a Function of Conditions of Culture, 1205
Ferrari, R, and Matracia, S Interaction between Lysozyme and a Phospholipid of Neoplastic Tissue (Oncolipin), 1187
Ferretti, A, and others Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall, 552
Ferromagnetic Inclusions in Nucleic Acid Samples (W M Walsh, jun, R G Shulman and R D Heidenreich), 1041
Fertility of some Strains of *Neurospora crassa* Effect of Kinetin on the (Barry O Lee), 288
Fever O'Nyong-nyong (J D Gillet, M C Williams J P Woodall, P S Corbet and J M Ellice), 30
Fibers (Protein) Ultrastructure of—Collagen, Muscle and Keratin (Electron Microscope Society of America Symposium on), 610
Fibre Follicles in Romney Ewes (Dr A B Wildman), 997
Fibres (Rabbit Ventricular) Evidence for Independence of Voltage of the Membrane Conductance of (Dr Edward A Johnson and J Tille), 663
Fibrin Powders (Human, Cow and Rabbit Native), as Anticoagulants (Dr A L Copley and Beverly Becher), 568
Fibroblast (Cultured) Increase in the Dense Cytoplasmic Bodies in Radiation-induced Giant Cells of the (Dr A F Hayward), 891
Fibroblast Cultures Cytotoxic Effect of Aminoacetonitrile on, and its Prevention by Histidine (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Fibrocystic Disease of the Pancreas Acetylcholine in Sweat in (Dr Edward L Eyerman, Dr Robert J Hurley and Dr Richard L Irwin), 77
Fick Procedure (New Indirect), for the Determination of Cardiac Output (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
Field, G J, and Watts, Dr H Distribution of Pressure for Flow of Gas through Porous Media, 1277
Field Centre Lanehead 404
Field Studies Council Courses for 1962, 1132
Fifty Years of Stedman, *review* by Dr K M Hawkins 1222
Filamentous Fungi Formation of 2-Heptanone from Caprylic Acid by Spores of various (R F Gehrig and Prof S G Knight), 1185
Filaments (Narrow Tungsten) Polarized Thermal Emission from (Prof Yngve Öhman), 254
Filosa, Michael F (Clegg, James S, and) Trehalose in the Cellular Slime Mould *Dictyostelium mucoroides*, 1077
Filter Paper Enzymatic Hydrolysis of Biliary Conjugates of 3,4-Benzpyrene on (Dr Hans L Falk, Sung Suk Lee and Prof Paul Kotin), 973
Filter Papers on Planchettes for Radioactive Counting A Simple Flattener for holding (Dr Edward A Smuckler and Prof Earl P Benditt), 191
Filters (Membrane) Influence of Adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on (N D Harris and J P Richards), 87
Filtration (Gel) Purification of Urinary Conjugated Œstrogens by (C G Beling), 326
  Purification and Concentration of Dye-Protein Conjugates by (Dr W. George and Dr K W Walton), 1188
  Rapid Preparation of Fluorescent Antibodies using (Johan Killander, Jan Pontén and Lennart Rodén), 182
Finance (University), in Britain (1959-1960), 617
Fine Structure of the Arteriolar Nerves in the Guinea Pig Pancreas (Dr. J D Lever and Dr A C Esterhuizen), 566
Fine Structure in Jovian Decametric Radiation Presence and Correlation of (James N Douglas and Harlan J Smith), 741
Fine Structure of Viruses (Electron Microscope Society of America Symposium on), 611
Finlayson, Dr R, and Hirchinson, V Experimental Atheroma in Budgerigars, 369
Firat, Prof S At the Thirteenth Congress of the International Union of Forest Research Organizations (Growth and Yield), 614
Fire Possible Origin of the Use of, by Early Man (D C Arnold), 1318
Fire Offices' Committee Joint Fire Research Organization (Department of Scientific and Industrial Research and) Fire Research 1960—Report of the Fire Research Board with the Report of the Director of Fire Research, 1250
Fire Research 1960—Report of the Fire Research Board with the Report of the Director of Fire Research (Department of Scientific and Industrial Research and Fire Offices' Committee Joint Fire Research Organization), 1250
Fire Research Board Fire Research 1960—Report of the, with the Report of the Director of Fire Research (Department of Scientific and Industrial Research and Fire Offices' Committee Joint Fire Research Organization), 1250
Fire Statistics, 1960 United Kingdom—Statistical Analysis of Report of Fires attended by Fire Brigades in the United Kingdom during 1960, 1131
Fired Kaolin and Kaolinitic Clay Puzzolanic Activity and Semiconductivity of (A K Chatterji), 1180
Fired Kaolinite-Hydrous Mica–Quartz Clay Moisture Expansion Relationships for a (Dr W F Cole), 737
Fireman, Edward L, and Fisher, David E Uranium in the Sikhote–Alin Meteorite and its relation to the Lead Method of Age Determination, 644
Firsoff, V A Moon Atlas, *review* by Brian Warner, 1111
Firth, D Promoted to Senior Principal Scientific Officer, 214, work of, 214
Firth, I M, and Bijl, Dr D Detection of Spin Magnetization Variation in a Two-level Maser Oscillator, 860
Firth, Prof R Captain Cook's Voyages, *review*, 1107
Fischmann, Dr E J (Barber, Dr M R, and) Heart Dipole Regions and the Measurement of Dipole Moment, 141
Fish (Fisheries Division of the United Nations Food and Agriculture Organization Conference on), 1013
Fish in Nutrition (Dr C L Cutting), 1013
Fish (Cat-) Barbels Response of, to Taste Stimuli (Hideki Tateda), 343
Fish (Common Dog-) An Intra-Pericardial Hepatic Intrusion in the (Dr A S Fuller), 280
Fish (The Grayling), and River-Names (John Tutin), 1102
Fisher, David E (Fireman, Edward L and) Uranium in the Sikhote–Alin Meteorite and its relation to the Lead Method of Age Determination, 644
Fisher, H, and others Requirement of Essential Fatty Acids and Avian Atherosclerosis, 1310
Fisher, Prof W B Precis de Climatologie, *review*, 1223
Fisheries (West African) Preliminary Bionomic Data from (Trawl Fishing in the Tropical Atlantic), (Alan R Longhurst), 621
Fishes Experimental Ecology of the Feeding of (Prof V S Ivlev), translated from the Russian by Douglas Scott, *review* by L Birkett, 297
  Haemoglobin Polymorphism in (Dr Knud Sick), 894
  Mathematical Theory of Nutritional Relationships of, *review* by L Birkett, 297
  Parasitology of (V A Dogiel, G K Petrushevski and Yu I Polyanski), translated by Dr Z Kabata, *review* by Dr Ben Dawes, 832
Fishes (Central African Freshwater) Feeding Habit of some (H Matthes), 78
Fishes (Mediterranean), of the Family Istiophoridae (Dr Enrico Tortonese), 80
Fishing (Trawl), in the Tropical Atlantic—Catch-rates and Composition (R H Lowe (McConnell) and Alan R Longhurst), 620, Preliminary Bionomic Data from West African Fisheries (Alan R Longhurst), 621
Fission (Nuclear) The Balance of Energy in (G N Walton), 1062
Fission Fragment Molecular Disarray in a Crystal Lattice produced by a (Dr F P Bowden and L T Chadderton), 31
Fission Products The Entry of, into Food Chains (edited by J F Loutit and R Scott Russell), *review* by Dr Hugh D Evans, 6
Fission Products (Long-lived), and Level of Activity in Milk Analysis of the Relationship between Deposition of (Dr W Anderson, L K Burton and J O Crookall), 1009
Fission Products (Stratospheric) Transfer of, into the Troposphere (D H Peirson), 497
Five-Covalent Copper (II) Complexes containing 1,10-Phenanthroline and 2,2′-Bipyridyl (Properties of some Copper Complexes), (Dr C M Harris, T N Lockyer and Hanneke Waterman), 424
Five Space Equation of Motion in (Prof Christopher Gregory), 1320
Fixation of Muscle (G Goldspink), 1305
Fixation (Nitrogen) Effect of Copper Deficiency in White Clover on (F H van der Elst, K J McNaught and W F Rolt), 1315
Fixation (Symbiotic Nitrogen), by Alder (*Alnus glutinosa* Gaerth) Molybdenum and (Dr J H Becking), 1204
Flagellar Changes in *Escherichia coli* induced by Temperature of the Environment (Dr Robert B Morrison and Jean McCapra), 774

Flare Effects (Possible Solar), in the *F* Region of the Ionosphere (Dr G H Munro), 347 , (Dr R W Knecht and Dr K Davies), 348
Flares (Solar) Coincidence of the Explosive Phase of, with 10 7-cm Solar Noise Bursts (Arthur E Covington and Gladys A Harvey), 152
Flaschka, H Microchemical Techniques (Value of Photometric Titrations for Metal Ions present in Small Amounts or at extremely Low Concentrations), 411
Flattener (A Simple), for holding Filter Papers on Planchettes for Radioactive Counting (Dr Edward A Smuckler and Prof Earl P Benditt), 191
Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and Apoprotein Derivatives Structure and Properties of the (Prof R K Morton), 727
Flavoprotein and Apoprotein Derivatives Structure and Properties of the Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, (Prof R K Morton), 727
Flavour (Oxidized), in Milk Hormonal Control of (Harald Astrup), 559
Flea An Apparatus for Observations on the Feeding Mechanism of the (M M J Lavoipierre and M Hamachi), 998
Fleck, Adam Appointed to a lectureship in biochemistry in the University of Glasgow, 1132
Fleissner, Sylvia, and others Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with Liver Glycogen Disease (Von Gierke's Disease), 265
Fleming Memorial Fund for Medical Research Grant of £48,000 to the University of Oxford, for the Sir William Dunn School of Pathology, 404
Flesher, A M , and others Radioproteotive Effects of Reserpine and its *N*-oxide, 1309
Fletcher, W H W , and others A New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient Magnetic Fields, 622
Flies on Insecticidal Deposits A Technique for Exposing individual (H C M Parr and J E H Grose), 475
Flies (Tsetse) Effect of Age and Pregnancy on the Tolerance of, to Insecticides (G F Burnett), 188
Flipse, Dr L P At the First British Insecticide and Fungicide Conference (Soil Sterilants), 1141
Floor of the Atlantic Natural Glass from beneath Red Clay on the (Dr G D Nicholls and V T Bowen), 156
Flora of New Zealand (Dr H H Allan), Vol I, Indigenous Tracheophyta, Psilopsida, Lycopsida, Filicopsida, Gymnospermae, Dicotyledones, *review* by Dr George Taylor, 1108
Flora of the Zambezi Basin, *review* by E Milne-Redhead, 1220
Flora (British) A New Illustrated (Dr Roger W Butcher), Part I, Lycopodiaceae to Salicaceae, *review* by R D Meikle, 1221
Flora Zambesiaca—Mozambique, Federation of Rhodesia and Nyasaland, Bechuanaland Protectorate, Vol I, Part 2, (edited by A W Exell and H Wild), *review* by E Milne-Redhead, 1220
Flores, Dr Ivan Computer Logic—the Functional Design of Digital Computers, *review* by Dr M V Wilkes, 489
Florey, Sir Howard Exchange of Substances between the Blood and Tissues (Anniversary Address to the Royal Society), 908
  Re-elected president for 1962 of the Royal Society, 918
  Mechanisms of Virus Infections, 1246
Florey, Sir Howard, and Grant, L H Leucocyte Migration in Inflammation, 801
Florkin, Prof Marcel (editées et annotees par) Lettres de Theodore Schwann (1810-1882), *review* by Prof Kenneth J Franklin, 692
Flour (Wholewheat) Trypsin Inhibitor in (G Shyamala, Barbara M Kennedy and Prof R L Lyman), 360
Flour Protein Modification of the Properties of, by Thiolated Gelatin (E E McDermott and J Pace), 657
Flow of Air (Real Gas Equilibrium), in Hypervelocity Test Facilities with Total Temperature to 10,000° K Mach Tables for (K L Goin), 308
Flow of Blood in the Forearm of Persons acclimatized to Heat (Dr G C Whittow), 759
Flow of Gas through Porous Media Distribution of Pressure for (G J Field and Dr H Watts), 1277
Flow (Heat), in Liquids Diffusion and (H J V Tyrrell), *review* by Prof A R Ubbelohde, 845
Flow (Oscillatory), in an Air-filled Elastic System (Group-Capt J E Malcolm), 875
Flow (Unstable), of Molten Polymers (J J Benbow, R V Charley and P Lamb), 223
Flow (Water-) Measurement of, *review* by Prof S P Hutton, 842
Flowering in *Pinus banksiana* Influence of Date of Flushing on (Philip R Larson), 82
Flowering of Seedling Apples Rootstock Influence on the (H M Tydeman), 83
Flowering Effects on Senescence A Distinction between Bolting and (Prof Jules Janick and A C Leopold), 887
Flowers (Bamboo) Feeding of, to Laboratory Rats and Mice (V Mahadevan, Dr S S Negi and O N Agarwala), 470
Floyd, K W , and others Pituitary Effect on Synthesis of Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation, 1309
Fluctuations in Hormone Activity in Brachyura Larvae (John D Costlow, jun), 183
Fluctuations in Marine Populations in Icelandic Waters (G Bodvarsson and J Jonsson), 768
Fluid (Ascitic) Identification of Antibody in β_2-Globulins of Mouse Serum and (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
Fluid (Normal and Pathological Cerebrospinal) Antithrombin Activity of (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Fluid (Synovial) Presence of Haptoglobin in (Prof Otto W Neuhaus and Virginia P Sogoian), 558
Fluid Media Evidence for the Photo-Association of Aromatic Hydrocarbons in (Dr B Stevens), 725
Fluids (Body) Blood and other (Analysis and compilation by Philip L Altman , edited by Dorothy S Dittmer), *review* by Sir Hans Krebs, 591
Fluorescence (Ultra-violet), of several Globular Proteins Influence of pH and Urea on the (R F Steiner and H Edelhoch), 873
Fluorescent Antibodies Rapid Preparation of, using Gel-Filtration (Johan Killander, Jan Ponten and Lennart Roden), 182
Fluorescent Particles Loss of, in Atmospheric Diffusion Experiments by Comparison with Radioxenon Tracer (A E J Eggleton and N Thompson), 935
Fluorescent Protein Conjugates Purification of—Comparison of Charcoal and 'Sephadex' (Dr J E Fothergill and Dr R C Nairn), 1073
Fluoro-Acetonitrile Microwave Spectrum of (B E Job and Dr J Sheridan), 160
18-Fluoro-*cis*-9-Octadecenoic Acid (*Dichapetalum toxicarium*) Synthesis of the Toxic Principle of (Prof F L M Pattison and R E A Dear), 1284
5-Fluorodeoxyuridine Reversal of Toxicity of 5-Fluorouracil and, for *Candida albicans* by Pyridoxine and Pyridoxamine (Dr M L Littman and Dr T Miwatani), 1155
5-Fluorouracil and 5-Fluorodeoxyuridine Reversal of Toxicity of, for *Candida albicans* by Pyridoxine and Pyridoxamine (Dr M L Littman and Dr T Miwatani), 1155
Flushing Influence of Date of, on Flowering in *Pinus banksiana* (Philip R Larson), 82
Flying-Spot Interference Television Microscope (Television Microscopy), (Dr P O'B Montgomery and L L Hundley), 1059
Foetal Circulatory Homeostasis Sensory Deprivation and (Prof S R M Reynolds), 818
Foetal Haemoglobin in Fanconi Type Anaemia (Dr J H Jones), 982
Foetal Rabbit Hormonal Control of the Development of the Thymus of the (J G Bearn), 875
Foetus Genetical Evidence for Synthesis of Transferrin in the (Dr A R Rausen, Dr P S Gerald and Dr L K Diamond), 182
Foetus (Human) P_1 Antigen in the (Elizabeth Ikin, Dr H E M Kay, J H L Playfair and Dr A E Mourant), 883
Fok, V A (edited by) Table of Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$$

for Complex Argument (V N Faddeyeva and N M Terent'ev), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Folk, John E (Glenner, George G , and) Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices—Histochemical Demonstration of γ-Glutamyl Transpeptidase-like Activity, 338 , Histochemical Characterization of a Unique α-Glutamyl Peptidase Activity, 339
Folk-Life Studies, Society for Establishment of the, 19
  Election of Officers, 19
Follicles (Fibre), in Romney Ewes (Dr A B Wildman), 997
Folsome, Prof C E , and Levin, D Detecting Reversion in *T*4rII Bacteriophage to r^+ induced by Ultra-Violet Irradiation, 1306
Food The Better Use of the World's Fauna for (Institute of Biology Symposium on), 21, 1112
Food Chains The Entry of Fission Products into (edited by J F Loutit and R Scott Russell) *review* by Dr Hugh D Evans, 6
Food Consumption and Expenditure Domestic (1959)—Annual Report of the National Food Survey Committee (Ministry of Agriculture, Fisheries and Food), 317

  Election of Officers, 615
Forestry Institute (Commonwealth) Imperial Forestry Institute, Oxford, re-named the, 802
Forestry Institute (Imperial), Oxford Re-named the Commonwealth Forestry Institute, 802
Formal Logic A History of (Dr I M Bochénski), translated and edited by Ivo Thomas), *review* by F I G Rawlins, 693
Formal Logic in Retrospect, *review* by F I G Rawlins, 693
Formaldehyde Demonstration of Interaction Products of Adenine and Adenosine Phosphates with (Dr D L Woodhouse), 336
Formation of Active Nitrogen using Sources of Alternating Current and Direct Current (G G Mannella), 159
Formation of Air–Water Froths (J Rennie and W Smith), 419
Formation of Auxin-bound Proteins (Archana Sen Gupta and S P Sen), 1290

INDEX

Formation of 3,4-Benzpyrene Inhibition of the, during Hydrocarbon Combustion (R Long and S K Ray), 353
Formation of Cracks in Ice Plates by Thermal Shock (L W Gold), 130
Formation of Different Haemoglobins in Tissue Culture of Human Bone Marrow treated with Human Deoxyribonucleic Acid (Prof Lorraine M Kraus) 1055
Formation of 2 3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Formation of 2-Heptonone from Caprylic Acid by Spores of various Filamentous Fungi (R F Gehrig and Prof S G Knight), 1185
Formation of Histamine and Histamine-like Substances from Histidine by Quartz Dust (L W Marasas), 872
Formation of Pegmatitic Carbonatite in a Syenite–Marble Contact (R D Schuiling), 1280
Formation (Abnormal Globin), in Human Megaloblasts (Prof Austin S Weisberger and Ernest P Noble), 1261
Formation (Free-Radical) during Storage of Freeze-dried *Serratia marcescens* (Dr R L Dimmick R J Heckly and D P Hollis) 776
Formation (Heat of), of the Difluoromethylene Radical (Dr J R Majer and Dr C R Patrick), 866
Formation (Induced), of Malic Enzyme in *Lactobacillus arabinosus* (17-5) Nutritional Requirements for the (Sheila M Bocks), 89
Formation (Ordovician Nod Glas), of Merioneth Chitinozoa from the (Prof F H T Rhodes), 275
Formation (Pyrolytic Carbon), from Carbon Suboxide (B C Banerjee, T J Hirt and Prof P L Walker, jun), 450
Formation (Reticular) Effects of Electrical Stimulation of, on the Lactic Acid Content of the Rat Brain (Dr Lj Mihailovic, Lj Krzalic and D Cvetkovic) 1166
Formation (Tooth) Third Molar Polymorphism and the Timing of (Stanley M Garn, Arthur B Lewis and Batsheva Bonné) 989
Forms (Cultivated), of *Brassica oleracea* Juvenile Stage in (Dr L G G Warne), 889
Forshufvud, Dr Sten, and others Arsenic Content of Napoleon I's Hair probably taken immediately after his Death, 103
Forss, D A (Horwood, J F, and) At the Third Australian Spectroscopy Conference (Methods for Handling Micro-quantities of Samples for Absorption Spectrometry), 928
Fort Portal Area in Western Uganda Carbonatitic Lava from (Dr O von Knorring and Dr C G B du Bois), 1064
Fossil Microplankton Classification of (Dr C Downie, G L Williams and Dr W A S Sargeant), 471
Foster J W (Ishikura, Tomoyuki, and) Incorporation of Molecular Oxygen during Microbial Utilization of Olefins, 892
Foster, Dr W D Chemistry in the Service of Medicine (Chemical Pathology), 1017
Fothergill Dr J E and Nairn, Dr R C Purification of Fluorescent Protein Conjugates—Comparison of Charcoal and 'Sephadex', 1073
Fothergill, Dr Philip G Evolution and Christians, *review* by the Rev Charles E Raven 827

Freedom of the University The State and the, 212
Freeguard, G F, and Stock, R Partition Isotherms and Gas-Liquid Chromatography, 257
Freeze-dried Beef (Fresh, Frozen and) Comparative Effects of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from (L J N Cole), 1288
Freeze-dried *Serratia marcescens* Free-Radical Formation during Storage of (Dr R L Dimmick, R J Heckly and D P Hollis), 776
Freeze-drying of Bovine Spermatozoa (R G Saacke and Prof J O Almquist), 995
Freezing Damage to Living Cells Prevention of, by Pyridine *N*-Oxide (T Nash), 360
Fregert, Dr Sigfrid and Rorsman, Dr Hans Allergy to a Carbon-Functional Organic Silicon Compound, Dimethyldi-(4-hydroxyphenyl)-silane, 989
Frei, Dr Eva, and Preston, Prof R D Variants in the Structural Polysaccharides of Algal Cell Walls, 939
French, Dr H A, and Cullen, Prof A L Microwave Measurement Techniques (Wattmeter for use at Millimetric Wave-lengths), 410
Frenk S (Holmgren, B, and) Inhibitory Phenomena and 'Habituation' at the Neuronal Level, 1294
Frequencies (Optical) Proposed Harmonic Generator or Mixer for (Dr K D Froome), 859
Frequency (High-Altitude Auroral) Diurnal Variation of, on Magnetically Quiet and Disturbed Days (Knut Lassen), 345
Fresh Waters and Rain Water Concentration of Chloride in (A V Holden), 961
Fresh and Cultured Tissues Chromosome Preparation from, using a Modification of the Drying Technique (M Fox and Dr I M Zeiss) 1213
Fresh, Frozen and Freeze-dried Beef Comparative Effects of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from (L J N Cole), 1288
Freshwater Fishes (Central African) Feeding Habit of some (H Matthes), 78
Freudenthal, Dr Hans Lincos—Design of a Language for Cosmic Intercourse, Part I, *review* by Prof Lancelot Hogben, 826
Frick, M H, and others Thrombocytosis evoked by Exercise, 721
Friction Effective Contact Stresses and (Dr D H Trollope), (July 22, 376), *errata*, 213
Friedman, Irving, and others Isotopic Composition of Atmospheric Hydrogen and Methane, 648
Frog Renal Cells Cultivation of Monolayer Cultures of (Dr Walter Auclair), 467
Froggatt, Dr P The Vehicle Driver (Bus Drivers), 1245
Frohman, Dr C E, and others Orosomucoid in Schizophrenia, 370
Froome, Dr K D Proposed Harmonic Generator or Mixer for Optical Frequencies, 859
Frost, N E Difference between High- and Low-Stress Fatigue, 446
Froths (Air–Water) Formation of (J Rennie and W Smith), 419
Frozen and Freeze-dried Beef (Fresh,) Comparative Effects of 2,4-Dinitrophenol on the Actomyosin Adenosine Triphosphatase from (L J N Cole), 1288
Fruit Condition (Hollow), of Tomatoes Influence of Tomato Mosaic Virus Infection on the (D J Harrison), 90
Fruit Tree Red Spider Evaluation of the Activity of some Diphenyl Compounds on Winter Eggs of the (J Meltzer), 474
Fryer, Squadron-Leader D I The Vehicle Driver (Development of Safety Belts in Aircraft), 1245
Fuchs, Z, and others Cytotoxic Effect of Aminoacetonitrile on Fibroblast Cultures and its Prevention by Histidine, 170
Fucoidin (Alginic Acid, Mannitol, Laminarin and), in the Brown Alga, *Ecklonia radiata* Seasonal Variation in (C M Stewart, H G Higgins and Sue Austin), 1208
Fuel Technical Data on (edited by H M Spiers), sixth edition, *review* by R J Sarjant, 1008
Fuhren, P, and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Tannages of Synthetic Polypeptides (used as Model Substances) with Chrome), 613
Fujii, Michiko, and others Effect of Temperature during Germination on the Crystalline Type of Starch in Soybean Seedlings, 239
Fujino, Prof Masahiro, and others Glycerol Effect' and the Mechanism linking Excitation of the Plasma Membrane with Contraction, 1159
Fulbright Travel Grants, 406
Fuller, Dr A S An Intra-Pericardial Hepatic Intrusion in the Common Dogfish, 280
Fulton, Prof John F A Bibliography of the Honourable Robert Boyle, Fellow of the Royal Society, second edition, *review* by V A Eyles, 851
Function The Eye and its (Dr R A Weale), *review* by Dr E N Willmer, 295
Function $w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$ Table of Values of the, for Complex Argument (V N Faddeyeva and N M Terent'ev), edited by V A Fok, (translated from the Russian by D G Fry), *review* by Prof C A Coulson 97
Function of Conditions of Culture Œstrogen Content of Plants as a (Prof R Ferrando, M M Guilleux and A Guerrillot-Vinet), 1205
Function (Pituitary Gonadotrophic) Non-steroid Inhibitors of (G E Paget, A L Walpole and D N Richardson), 1191
Function (Riemann ζ) Tables of the (C B Haselgrove, in collaboration with J C P Miller), (Royal Society Mathematical Tables, Vol 6) *review* by Prof C A Coulson, 97
Function (Structure, Synthesis and), of Deoxyribonucleic Acid (Société de Chimie Physique Discussion on) 24
Function Theory and its Applications, *review* by Prof W K Hayman, 694
Functional Analysis Elements of (L A Liusternik and V J Sobolev) translated from the Russian by Anthony E Labarre, Jr, Herbert Izbicki and H Ward Crowley, *review* by Dr J C Burkill, 491
Functions Bessel (edited by F W J Olver), Part 3 Zeros and Associated Values (Royal Society Mathematical Tables, Vol 7), *review* by Prof C A Coulson, 97
    Holomorphic (Lectures on the Theory of Functions of a Complex Variable (Prof G Sansone and Dr Johan Gerretsen, Vol I), *review* by Prof W K Hayman, 694

Functions of a Complex Variable Lectures on the Theory of (Prof G Sansone and Dr Johan Gerretsen), Vol I, Holomorphic Functions, *review* by Prof W K Hayman, 694
Functions (Airy), and Special Confluent Hypergeometric Functions for Asymptotic Solutions of Differential Equations of the Second Order Tables of (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Functions (Special Confluent Hypergeometric), for Asymptotic Solutions of Differential Equations of the Second Order Tables of Airy Functions and (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Fundamental Cancer Research Sixteenth Annual Symposium on—Conceptual Advances in Immunology and Oncology (University of Texas), 1132
Fundamental Relaxation of Classical Oscillators (Michael Hoare), 63
Fundamental Research in Plastics Fellowships in Engineering Study and (Princeton University), 921
Fundamental and a Lattice Mode A Difference Band of a, in the Infra-red Spectra of Lead and other Carbonates (C J H Schutte and K Buijs), **351**
Fundamental and Practical Approaches to Ageing Protection (Natural Rubber Producers' Research Association Symposium on), 115
Fundamentals (Design), of Analog Computer Components (Prof R M Howe), *review* by Dr M V Wilkes, 489
Funds for Research and Development in Industry, 1958 (United States National Science Foundation, Surveys of Science Resources Series, NSF 61-32), 809
Fungi (Filamentous) Formation of 2-Heptanone from Caprylic Acid by Spores of various (R F Gehrig and Prof S G Knight), 1185
Fungicide Conference British Insecticide and (Association of British Manufacturers of Agricultural Chemicals), 406, 1140
Fur Seals Breeding in the Falkland Islands Dependencies (F A O'Gorman), 914
Furnaces (Induction) Design of Laboratory High-Temperature (P H Dundas), 114
Furniture (Printing and) Licentiates in (City and Guilds of London Institute), 920
Further Education, Yorkshire Council for, and others Symposium on Antibiotics and Newer Synthetic Drugs, 1132
Furusaka, Prof C : Sulphate Transport and Metabolism by *Desulphovibrio desulphuricans*, 427
Fused Uranium Chlorides Organic Extraction from (M Taube and Z Borkowska), 745

GAARDER A , and others Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of Human Blood Platelets, 531
Gabon Les Plantes utiles du (André Raponda-Walker et Roger Sillans), *review* by T A Russell, 693
Gabor, Prof D , and Jones, Dr D Awarded a grant of £1,000 from the Paul Instrument Fund (in supplement of a previous grant), for work on the development of an electron interference microscope, 708
Gabriel, Dr A H Spectroscopic Studies using Time-Resolved Techniques, 1032
Gadkari, P D , and others Cotton in India, Vol 4, *review* by Prof S C. Harland, 200
Gadó, I , and others Possible Causes for Production of Isoleucine by *Streptomyces rimosus*, 641
Gaertner, Dr H A , and others Antithrombin Activity of Normal and Pathological Cerebrospinal Fluid, 1164
Gahne, Bo, and Rendel, Jan Blood and Serum Groups in Reindeer compared with those in Cattle, 529
Gairdner Foundation Awards, 309
Galactic Red Shift (Dr A Ward), 858
β-Galactosidase Hydrolysis of α-Sulphoquinovosides by (Isao Shibuya and Prof A A Benson), 1186
Galaxies The Hubble Atlas of (Dr Allan Sandage), *review* by Prof R O Redman, 838
  The Natural History of, *review* by Prof R O Redman, 838
Gale, Dr E F Synthesis and Organisation in the Bacterial Cell (Ciba Lectures in Microbial Biochemistry, 1959), *review* by Dr S Dagley, 489
Galitskii, V M , and others Problems in Quantum Mechanics, *review* by S F Edwards, 1005
Gall, Elemer Cs , and others Nature of Increased Protein and DNA in Chronic Hepatic Injury, 886
Gallagher, Dr C H Protection by Antioxidants against Lethal Doses of CarbonTetrachloride, 881
Gallium Arsenide (High-Resistivity) Energy-Level Model for (J Blanc and L R Weisberg), 155
Gamble, L W Microchemical Techniques (Characterization of Aliphatic Hydrocarbons), 411
γ-Globulin and Acquired Immunity to Human Malaria (Dr S Cohen, Dr I A McGregor and S Carrington), 733
γ-Globulin (Human 7S) Serological Evidence of a Chromatographic Subfractionation of (Ulf Nilsson), 1301
γ-Globulin (Serum), in the Guinea Pig Effect of Diethylstilboestrol on the (L M Charles and Prof T Nicol), 565
γ-Globulins (Pathological Human) Resolution of, by Starch-Gel Electrophoresis (J P Binette and K Schmid), 732
γ-Glutamyl Transpeptidase-like Activity Histochemical Demonstration of (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 338
γ-Radiation Effect of, on *Escherichia coli* grown in Deuterium Oxide Medium (Ernest Pollard), 177
γ-Radiolysis of Aqueous Cystine Solutions Products of the (Dr D W Grant, S N Mason and M A Link), 352
γ-Rays Effect of, on Thymus Nucleoprotein in Solution (Dr A R Peacocke and Dr B N Preston), 228
Garden, E A (Rayski, Dr C , and) Life-Cycle of an Acanthocephalan Parasite of the Eider Duck, 185
Garden and Roadside Planting Ornamental Trees for (S A Pearce), *review* by F P Knight, 852
Gardening Water (Frances Perry), third edition, *review* by Dr G Taylor, 392
Garen, A Structure, Synthesis and Function of Deoxyribonucleic Acid (Code and Replication), 25
Garfield, A Chemico-Linguistics—Computer Translation of Chemical Nomenclature, 192
Garn, P D , and Kessler, J E Microchemical Techniques (Thermal Analysis is feasible for Sample Weights less than 1 mgm by the use of appropriately designed Sample Holders), 412
Garn, Stanley M , and others Third Molar Polymorphism and the Timing of Tooth Formation, 989
Garratt, Dr D C Pharmaceutical Control in Britain (Chairman's Address to the British Pharmaceutical Conference), 122
Garrett, Constance M E (Crosse, J E , and) Relationship between Phage Type and Post Plant in *Pseudomonas mors-prunorum* Wormald, 379
Garrigus, U S , and others Radioactivity in Wool, 1094
Gas through Porous Media Distribution of Pressure for Flow of (G J. Field and Dr H Watts), 1277
Gas Chromatography Detection by Ionization of Gases in Helium used in (W A Wiseman), 964
  Pyrolysis and, for the Detection of the Benzene Ring in Organic Compounds (J H Dhont), 747
Gas Chromatography of Androst-16-en-3α-ol and related Steroids (R W R Baker and Dr D B Gower), 1074
Gas Chromatography in Medical Research (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 717
Gas Chromatography (Improved), of Unesterified Fatty Acids (P Jowett and B J Horrocks), 966
Gas Chromatography (Substractive) Behaviour of 5*A* Molecular Sieve in (E R Adlard and B T Whitham), 966
Gas Council Appointment of Dr J A Gray as head of the new Basic Research Group, at the London Research Station at Fulham, 306
Gas Dynamic Studies Bibliography of Tables and Charts for Use in (D E Randall), 308
Gas Dynamics Physical (edited by A S Predvoditelev), translated from the Russian by Dr R C Murray and D R H Phillips, *review* by Dr I S. Donaldson, 837
Gas Dynamics in the U S S R , *review* by Dr I S Donaldson, 837
Gas Equilibrium Flow of Air (Real), in Hypervelocity Test Facilities with Total Temperature to 10,000° K Mach Tables for (K L Goin), 308
Gas Industry Research and Development in the, 306
Gas-Liquid Chromatography Partition Isotherms and (G F Freeguard and R Stock), 257
  Quantitative Estimation of Peak Areas in (J Dijkstra), 965 , (Prof. K K Carroll), 965
Gas–Liquid Chromatography of Steroids Group Retention Factors in the (R B Clayton), 524
Gas Sampling and Chemical Analysis in Combustion Processes (Prof G. Tine), *review* by Dr C F Cullis, 1108
Gases in Helium used in Gas Chromatography Detection by Ionization of (W A Wiseman), 964
Gastric Juice Agarophoresis and Immunoelectrophoresis of the Proteins of (M Tenorova, E Stuchlíkova and J Kořinek), 763
Gastrulation of the Viviparous Toothcarp *Xiphophorus helleri* Role of Cell Division in (Prof A Stolk), 374
Gatehouse, Dr B M , and others At the Third Australian Spectroscopy Conference (Factors affecting the Cathodic Sputtering of various Metals), 929
Gati, T , and others Effect of Monovalent Cations on the Blood Pressure of Intact and Hypertensive Rats, 362
Gawargious, Y (Macdonald, A M G , and) Microchemical Techniques (Comparative Study of various High Catalytic Fillings in the Combustion Analysis for Carbon and Hydrogen), 411
Gay (Arthur) Premium of the British Institution of Radio Engineers awarded to E Davies, 609
Gaydon, Dr A G Title of professor of molecular spectroscopy (at the Imperial College of Science and Technology, London) conferred on, 922
  The Study of Fast Reactions (Reactions in Shock Waves), 1136
Gazey, B K Appointed to a Research Fellowship in electrical engineering in the University of Birmingham, 406
Gegenschein Lunar Dust and the (John C Brandt and Paul W Hodge), 957
Gehrig, R F , and Knight, Prof S G Formation of 2-Heptanone from Caprylic Acid by Spores of various Filamentous Fungi, 1185
Geiger–Muller Counters (Self-quenching) Kinetics of Dissociation of Ethyl Halides in (Prof I Zlotowski and H Wincel), 550
Geilikman, Prof B T (edited by) Problems in Quantum Mechanics (Dr. I I Gol'dman and Dr V D Krivchenkov), translated from the Russian by E Marquit and E Lepa, authorised revised edition, *review* by S F Edwards, 1005
Gel Filtration Purification of Urinary Conjugated Œstrogens by (C G. Beling), 326
  Purification and Concentration of Dye-Protein Conjugates by (Dr W. George and Dr K W Walton), 1188
  Rapid Preparation of Fluorescent Antibodies using (Johan Killander, Jan Ponten and Lennart Roden), 182
Gel (Agar-) Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins *O* and *S* in (Extracellular Esterase of Group *A* Streptococci), (A H Stock and Jose Uriel), 435
Gel (Starch-) Electrophoresis Comparison of the Serum Protein Fractions of the Developing Chicken Embryo by the Technique of (A Amin), 356
  Resolution of Pathological Human Gamma-Globulins by (J P Binette and K Schmid), 732
Gel (Starch) Electrophoresis of Hen Egg White, Oviduct White, Yolk, Ova and Serum Proteins (Dr F Steven), 972
Gelatin (Thiolated) Modification of the Properties of Flour Protein by (E E McDermott and J Pace), 657
Gels of High and Physiological Salt Concentrations Antigen–Antibody Precipitation contrasted in (Dr Alfred J Crowle and David C. Lueker), 50
Gels (Agar), of various Pore Sizes A Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through (G K Ackers and R L Steere), 436
Gene synthesizing Protease and a Pre-Viral Genome in Silkworms (Prof. Kazuo Yamafugi and Fumiko Yoshihara), 782
General Nature of the Genetic Code for Proteins (Dr F H C Crick, Leslie Barnett, Dr S Brenner and Dr R J Watts-Tobin), 1227

General Post Office Retirement of T A Davies as inspector of wireless telegraphy in the Wireless Telegraph Section of the Radio Services Department, 1129
  Appointment of R Billington as inspector of wireless telegraphy in the Wireless Telegraph Section of the Radio Services Department, 1129
Generalized Skeletal Response on Local Trauma in Young Rats studied by means of ^{45}Ca-Metabolism (Dr Jaromir Kolař and Dr Arnošt Babicky), 1297
Generation (Thermionic), of Electricity (Central Electricity Generating Board Symposium on), 611
Generation and Reception (Millimetre Wave) Non-Linear Transmission Lines for (Dr D Walsh), 1064
Generation and Use of Very High, Continuous Magnetic Fields Advances in the (Dr Henry H Kolm), 299
Generation (Second-) Toxicity of Malathion in Rats (Prof W Kalow and A Marton), 464
Generator or Mixer (Proposed Harmonic), for Optical Frequencies (Dr K D Froome), 859
Genesis of the British National Health Service (Prof John Jewkes and Sylvia Jewkes), *review* by T H Hawkins, 849
Genetic Code for Proteins General Nature of the (Dr F H C Crick, Leslie Barnett, Dr S Brenner and Dr R J Watts-Tobin), 1227
Genetical Evidence for Synthesis of Transferrin in the Foetus (Dr A R Rausen, Dr P S Gerald and Dr L K Diamond), 182
Genome, *Acuminata* Relationship between 3,4-Dihydroxyphenylethylamine Content and the (L A Griffiths), 84
Genome (Pre-Viral), in Silkworms A Gene synthesizing Protease and a (Prof Kazuo Yamafugi and Fumiko Yoshihara), 782
Gentner, Prof W , and others Age of the Basalt Flow at Olduvai, East Africa, 720
Geographical Research (Geological and), in the U S S R , 114
Geography Applied (Prof Robert W Sceel), 715
Geography (Physical), of Asiatic Russia (S P Suslov), translated from the Russian by Noah D Gershevsky, edited by Joseph E Williams, *review* by Prof S I Tomkeieff, 200
Geological Correlation Application of Palaeomagnetism to (A Larochelle), 37
Geological Museum, London Exhibition of Rocks and Minerals used by the British Ceramic Industry, 21
  Special Exhibition on Tristan da Cunha, 403
Geological Society (Royal Astronomical Society and the) Geophysical Discussion on the Interpretation of Geophysical Surveys, 1242
Geological Survey, Entebbe Bulletin No 4, The Mineral Resources of Uganda (compiled and edited by Dr J W Barnes), 921
Geological Survey, London Appointment of Prof J C Mitcheson as chairman of the Board, 406
Geological and Geographical Research in the U S S R , 114
Geology at Trinity College, Dublin, 1022
Geology of Brown Clee Hill and the Adjacent Area (Prof L J Wills), 1250
Geology of the Northern Rhodesian Copperbelt (edited by Dr F Mendelsohn), *review* by Prof J H Taylor, 98
Geology and Allied Sciences Bibliography and Index of, for Wales and the Welsh Borders, 1897-1958 (D A Bassett), *review* by V A Eyles, 491
Geology and Ceramics (Dr P J Adams), 21
Geometry Modern, *review* by L Roth, 847
Geometry (Modern) Lectures on (Prof Beniamino Segre), *review* by L Roth, 847
Geophysical Surveys Interpretation of (Royal Astronomical Society and the Geological Society Geophysical Discussion on), 1242
Geophysical Year (International) Ionospheric Research during the, *review* by A F Wilkins, 840
  Some Ionospheric Results obtained during the—Proceedings of a Symposium organized by the U R S I /A G I Committee, at Brussels, 1959 (edited by W J G Beynon), *review* by A F Wilkins, 840
George, Dr F H At the Sixth Annual Conference of the British Society for the Philosophy of Science (Learning Machines), 508
George, Prof J C , and Bhakthan, N M G Lipase Activity in the Slow- and Fast-contracting Leg Muscles of the Cockroach, 356
George, Dr M Oil Pollution of Marine Organisms, 1209
George, Dr W , and Walton, Dr K W Purification and Concentration of Dye-Protein Conjugates by Gel Filtration, 1188
Gerald, Dr P S , and others Genetical Evidence for Synthesis of Transferrin in the Foetus, 182
Germ-free Chicks (Conventional and) Serotonin in the Small Intestine of (Prof A W Phillips, H R Newcomb, J E Smith and R Lachapelle), 380
Germination Effect of Temperature during, on the Crystalline Type of Starch in Soybean Seedlings (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
  Replacement of an Alternating Temperature Requirement for, by Gibberellic Acid (J M Tager and Brenda Clarke) 83
Germination of Lettuce Seed by Naringenin Induction of a Light Requirement for the, and its Removal by Gibberellic Acid (Dr I D J Phillips), 240
Gerrard, Dr W Fast Reactions in Physical Chemistry, 1136
Gerretsen, Dr Johan (Sansone, Prof G , and) Lectures on the Theory of Functions of a Complex Variable, Vol 1, Holomorphic Functions, *review* by Prof W K Hayman, 694
Gerschenfeld, Dr H M (Tauc, Dr L , and) Cholinergic Transmission Mechanisms for both Excitation and Inhibition of Molluscan Central Synapses, 366
Getoff, Dr Nikola, and Nishikawa, Masaru Behaviour of Neutron-Irradiated Ammonium Sulphate on Thermal Annealing, 61
Getters (Impure Titanium) Evolution of Hydrocarbons from (L Holland, L Laurenson and P G W Allen), 749
Ghana Politics and Education in, 1219
  University Education in (Dr C T Mortimer), 14
  Woody Plants of, with special reference to their Uses (Dr R F Irvine) *review* by W D Clayton, 695
Ghatge, M B, and others Cotton in India, Vol 3, *review* by Prof S C Harland, 200
Ghosh, N C , and others Biosynthesis of L-Ascorbic Acid—Missing Steps in Animals incapable of Synthesizing the Vitamin, 163
Ghosh, P (Palit, S R , and) Microchemical Techniques (Determination of Acids, Bases and Salts at Micromolar Concentrations in Benzene on the Colour Behaviour with Rhodamine and certain other Dyes), 411
Ghosh, S N , and others Antigenic Structure of *Entamoeba histolytica*, 893
Ghosh, S S (Chowdhury, Dr K A and) Indian Woods, Vol I, Dilleniaceae to Elaeocarpaceae, *review* by Dr C R Metcalfe 1110
Ghouri, Dr A S K Home and Distribution of the House Cricket, *Acheta domesticus* L , 1000
Ghurye, S G , and others (edited by) Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling, *review* by Dr D E Barton, 846
Giant Cells (Radiation-induced), of the Cultured Fibroblast Increase in the Dense Cytoplasmic Bodies in (Dr A F Hayward), 891
Gibberellate (Potassium) Effect of Temperature and, on Phases of Growth of Algerian Ivy (J R Goodin and Prof V T Stoutemyer), 677
Gibberellic Acid Bioassay of, using Excised Embryos of *Avena fatua* L (Prof J M Naylor and G M Simpson), 679
  Effect of Environment on the Responses of Dwarf Groundsel to (K H Basford), 992
  Induction of a Light Requirement for the Germination of Lettuce Seed by Naringenin, and its Removal by (Dr I D J Phillips), 240
  Replacement of an Alternating Temperature Requirement for Germination by (J M Tager and Brenda Clarke), 83
Gibberellic Acid in *Azotobacter* Cultures Detection of (V Vančura), 88
Gibberellic Acid and Chlorophyll Content of Leaves of Meteor Peas (P Bishop and Prof C P Whittingham), 576
Gibberellic Acid, Kinetin and other Substances Effect of, on Seed Dormancy (B Frankland), 678
Gibberellin ('Bound'), in Mature Runner Bean Seeds (A J McComb), 575
Gibbs, Dr F W Chemistry in the Service of Medicine (The Importance of Herman Boerhaave), 1017
Gibbs, Mary B , and others Quantitative Sub-Groups of the B Antigen in Man and their Occurrence in Three Racial Groups, 1196
Giblett, Dr Eloise R , and Best, Dr William R Haptoglobin and Transferrin Types in Peruvian Indians, 1300
Gibson, Dr A F Promoted to Deputy Chief Scientific Officer, 214 , work of, 214
Gibson, J S Elected to a Junior Research Fellowship at Churchill College, Cambridge, 710
Gibson, Dr K D , and others Biosynthesis of Porphyrins and Chlorophylls, 204
Gilbert, Dr C Dirac's Cosmology, 57
Gilbert, Dr G A (Gilbert, Lilo M , and) Sedimentation of β-Lactoglobulin (*A*,*B*) under Dissociating Conditions in Acid Solution, 1181
Gilbert, Lilo M , and Gilbert, Dr G A Sedimentation of β-Lactoglobulin (*A*,*B*) under Dissociating Conditions in Acid Solution, 1181
Gilboa-Garber, Nechama, and Nelken, Dr D Specific Antigens of Human Leucocytes and Thrombocytes, 466
Gill Tissue of Lingcod (*Ophiodon elongatus*) Penetration of Spines from a Marine Diatom into the (Dr Gordon R Bell), 279
Gillet, J D , and others O'Nyong-nyong Fever, 30
Gillham, E J Radiometic Standards and Measurements (National Physical Laboratory, Notes on Applied Science No 23), 1250
Gills of the Trout Action of a Detergent (Dodecylbenzenesulphonate) on the (O J Schmid and H Mann), 675
Gilmour, N J L , and Brotherston, J G Susceptibility of Hamsters to the Oral Administration of *Mycobacterium johnei*, 1202
Gilpin, N N Microchemical Techniques (Contemporary Position of Small-scale Methods in the Teaching of Chemistry at the Secondary School and Collegiate Levels), 412
Girard, Dr J , and others Growth Hormone Content of Serum in Infants, Children, Adults and Hypopituitary Dwarfs, 1051
Gittins, J F Promoted to Senior Principal Scientific Officer, 214, work of, 214
Gissane, W The Vehicle Driver (Nature and Causes of Injuries resulting from Motor-car Accidents in a City), 1245
Glaister, Flight-Lieut D H Breathing, 106
Gland (Adrenal) Stimulation of Uptake of Calcium-45 in the, by Acetylcholine (Prof W W Douglas and A M Poisner), 1299
Gland (Mammary) Permeability of the, to Sodium-24, Potassium-42, Chlorine-36 and Iodine-131 (P -G Knutsson), 977
Gland (Pig Thyroid) Demonstration and some Properties of Peroxidase in (Toichiro Hosoya and Nobuo Ui), 659
Glands (Female Rat Preputial), as a Source of β-Glucuronidase (Dr Margaret I Stern), 359
Glasgow, S K (Chapman, G P , and) Incipient Dioecy in Pimento, 1205
Glass, Bentley (edited by William D McElroy and) A Symposium on Light and Life (sponsored by the McCollum-Pratt Institute of the Johns Hopkins University with support from the United States National Science Foundation) *review* by Dr V S Butt 296
Glass (Natural), from beneath Red Clay on the Floor of the Atlantic (Dr G D Nicholls and V T Bowen), 156
Glass Electrodes Elimination of the Liquid Junction by using (Carl R Merril), 1087
Glazed Pottery (Medieval) A Spectroscopic Survey of English and Continental (L C Thomas and J W G Musty), 1143
Glazier, Dr E V D Astronautics (Radio Problems for Interplanetary Space Probe Missions), 311
Glenner, George G , and Folk, John E Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices—Histochemical Demonstration of γ-Glutamyl Transpeptidase-like Activity, 338 , Histochemical Characterization of a Unique α-Glutamyl Peptidase Activity, 339
Globin Formation (Abnormal), in Human Megaloblasts (Prof Austin S Weisberger and Ernest P Noble), 1261
Globular Proteins Influence of *p*H and Urea on the Ultra-violet Fluorescence of several (Dr R F Steiner and H Edelhoch), 873
α_2-Globulin Isolation of an, from Human Plasma (Dr M Steinbuch and Dr J Loeb), 1196
γ-Globulin (Human 7S) Serological Evidence of a Chromatographic Subfractionation of (Ulf Nilsson), 1301
γ-Globulin (Serum), in the Guinea Pig Effect of Diethylstilboestrol on the (L M Charles and Prof T Nicol), 565
γ-Globulin and Acquired Immunity to Human Malaria (Dr S Cohen, Dr I A McGregor and S Carrington), 733

β-Globulin Types (Serum), in Red Deer and other Species and their Stability in the Presence of Bacteria (V P W Lowe and E I McDougall), 983
β_2-Globulins of Mouse Serum and Ascitic Fluid Identification of Antibody in (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
γ-Globulins (Pathological Human) Resolution of, by Starch-Gel Electrophoresis (J P Binette and K Schmid), 732
Glough, G Appointed to a Research Studentship by the Zoological Society of London, 211
D-Glucosamine Hydrochloride Isomers Mannosyl—6-0-Mannosyl D-Glucosamine Hydrochloride (Dr S A Barker, Dr K Murray, Prof M Stacey and Dr D B E Stroud), (July 8, 143), *erratum*, 710
Glucose (Extracellular) Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of (P Volfin, D Eboué and H Clauser), 166
Glucose Oxidation in the Rat Lens Effect of Insulin on Pathways of (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075
Glucose-6-Phosphate (Blood), in Heterozygous Carriers and Patients with Liver Glycogen Disease (Von Gierke's Disease), (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265 , (Dr David Yi-Yung Hsia), 266
Glucose-6-Phosphate Dehydrogenase Activity in Papuans (Dr B P K Ryan and I C Parsons), 477
Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin on (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
β-Glucuronidase Female Rat Preputial Glands as a Source of (Dr Margaret I Stern), 359
Glueckauf, E (edited by) Atomic Energy Waste, its Nature, Use and Disposal, *review* by A W Kenny, 846
L-Glutamic Acid Effect of, on the Weight of Embryonic Chick Tibiotarsi cultivated *in vitro* (Dr J D Biggers), 664
Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices (George G Glenner and John E Folk)—Histochemical Demonstration of γ-Glutamyl Transpeptidase-like Activity, 338 , Histochemical Characterization of a Unique α-Glutamyl Peptidase Activity, 339
α-Glutamyl Peptidase Activity (Histochemical Characterization of a Unique (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 339
γ-Glutamyl Transpeptidase-like Activity Histochemical Demonstration of (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 338
'Glycerol Effect' and the Mechanism linking Excitation of the Plasma Membrane with Contraction (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
^{14}C-Glycine Incorporation of, by Sub-Nuclear Preparations from Rat Liver Nuclei (K R Rees Hazel F Ross and G F Rowland), 171
Glycine, Serine and Urea Some Tetrahydropyranyl Derivatives of (S M Amir, Dr M Z Atassi, Dr S A Barker, Dr J S Brimacombe and Dr M C Keith), 1069
Glycogen (Liver) Disease (Von Gierke's Disease) Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265 , (Dr David Yi-Yung Hsia), 266
Glycogenolysis and Inhibition of Microsomal Protein Synthesis produced by Dimethylnitrosamine Counteraction by Cysteine of (Dr P Emmelot and I J Mizrahi), 42
Glycol (Polyethylene), and Dyes Behaviour of Protozoa under the Influence of the Synergetic Action of (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Glycolipo-Protein Excretion of Uncrystallized Urinary Calculi composed of, by Normal and Muscular Dystrophic Mice (C McGaughey), 1267
Glycolysis (Anaerobic) Influence of, on Release of Histamine in the Guinea Pig and Rat Anaphylactic Reaction *in vitro* (A Prouvost-Danon and Dr H Moussatche), 361
Glycoprotein (Erythropoietic) Use of Phenol in the Isolation of (Peter H Lowy and Geoffrey Keighley), 75
Glycoproteins Permeability of the Synovial Membrane to (Lars Sundblad, Dr Eric Jonsson and Erik Nettelbladt), 1192
Gm System A Rare Phenotype within the (K Henningsen and Jørgen C Nielsen), 476
Gnetum (P Maheshwari and Vimla Vasil), *review* by Dr C R Metcalfe, 1006

Holocene Deposits (Pleistocene and), in the Haua Fteah Absolute Age of (Dr C B M McBurney), 685
Holomorphic Functions (Lectures on the Theory of Functions of a Complex Variable) (Prof G Sansone and Dr Johan Gerretsen, Vol 1), *review* by Prof W K Hayman, 694
Home and Distribution of the House Cricket, *Acheta domesticus* L (Dr A S K Ghouri), 1000
Homeostasis (Foetal Circulatory) Sensory Deprivation and (Prof S R M Reynolds), 818
Homma, S , and others Muscle Receptors (Potentiation of Motoneurones by Spindle Discharges, and Human Experiments on Reflexes involving Muscle Receptors), 806
Homogenates of Normal Sheep Liver Metabolism of Propionate by (R M Smith and W S Osborne-White), 868
Homografts Acquired Tolerance to, produced by Homologous Spleen Cell Injection in Adult Mice (Ronald D Guttmann and J Bradley Aust), 564
Homologue of Thio-Thiophthene Crystal Structure of 2,5-Dimethyl-Dithio-Furophthene, a (Dr M Mammi, R Bardi, G Traverso and S Bezzi), 1282
Homologous Antibody Esterase in Extracellular Concentrates of Group A Streptococci and the (Extracellular Esterase of Group A Streptococci), (Aaron H Stock, José Uriel and Pierre Gragar), 434
Homologous Bone Marrow or Spleen Cells Transfer of Immediate (Anaphylactic) Hypersensitivity by (Dr V Stanković and S Vlahovic), 762
Homologous Spleen Cell Injection in Adult Mice Acquired Tolerance to Homografts produced by (Ronald D Guttmann and J Bradley Aust), 564
Hongo, T (Shimazu, H , and) Muscle Receptors (Brain-stem Influences on the Motor Supply to Muscle Spindles), 805
Hope, Dr A B and others Electrolytes and Plant Cells, *review* by Dr James F Sutcliffe, 831
Hope, E R Confirmation of Outer Atmospheric Asymmetry postulated to explain the False Zodiacal Light, 742
Hopkins, Dr B J Thermionic Generation of Electricity (Work-Functions of Anodes opposite Oxide Cathodes), 611
Hopkins (Johns) University (sponsored by the McCollum-Pratt Institute of the, with support from the National Science Foundation) A Symposium on Light and Life (edited by William D McElroy and Bentley Glass), *review* by Dr V S Butt, 296
Hopkinson, Leonora, and Jackson, F L Prostatic Cytochromes, 264
Hopkins, Leonora, and Wakeley, J C N A Zinc-requiring Alkaline Phosphatase in the Ventral Lobe of the Rat Prostate, 357
Horecker, B Structure, Synthesis and Function of Deoxyribonucleic Acid (Chemical Sequence and Heterogeneity), 24
Horgan, V J , and Philpot, J St L Peroxide-like Substance in Alarmed Mice, 662
Hormann, H At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Chemistry and Structure of Collagen), 613
Hormogone-producing Blue-Green Algae Isolation of Bacteria-free Cultures from (Blue-Green Algae) (Dr J S Bunt), 1275
Hormonal Control of the Development of the Thymus of the Foetal Rabbit (J G Bearn), 875
Hormonal Control of Oxidized Flavour in Milk (Harald Astrup), 559
Hormone (Antidiuretic), and Renal Collecting Tubules (Paul Breddy, Grahame F Cooper and Dr Jeffrey M N Boss), 76
Hormone (Bovine Growth) Determination of the Amino-Acid Composition of (Dr Alan J Parcells), 971
Hormone (Growth) Content of Serum in Infants, Children, Adults and Hypopituitary Dwarfs (Dr J Girard, Dr M Vest and Dr N Roth), 1051
Hormone (Human Growth), and Sheep Interstitial Cell Stimulating Hormone Complement-fixing Antibodies to (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Hormone (Luteinizing), in Persistent Vaginal Œstrus (Dr G P van Rees and Dr J J van der Werff ten Bosch), 876
Hormone (Purified Growth) Failure of the, to restore the Size of the Kidneys in Hypophysectomized Rats (Dr T Astarabadi), 270
Hormone (Sheep Interstitial Cell Stimulating) Complement-fixing Antibodies to Human Growth Hormone and (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Hormone Activity in Brachyura Larvae Fluctuations in (John D Costlow, jun), 183
Hormone Activity (Growth), of the Anterior Pituitary Lobe of the Male Rat at various Ages (R H Bowman), 976
Hormones (Sex), as a Possible Factor controlling Biosynthesis of Arylesterase (Dr Klas-Bertil Augustinsson and Bertil Olsson), 969
Hormones and Electrolyte Excretion in Sheep (R Kinne, Dr W V Macfarlane and Prof O E Budtz-Olsen), 1084
Horne, F R The Swedish Seed Association, 110
Horowitz, Dr R M Biochemistry of Plant Phenolic Substances (Recent Studies on the Structures and Bitterness of the Flavonoid Glycosides of Citrus), 418
Horrocks, B J (Jowett, P , and) Improved Gas Chromatography of Unesterified Fatty Acids, 966
Horse Heart Cytochrome *c* Amino-Acid Sequence of—Peptides released by Digestion with Chymotrypsin (Dr E Margoliash and Prof Emil L Smith), 1121 , Peptides, Terminal and Internal, released by Digestion with Trypsin (Dr G Kreil and Prof H Tuppy), 1123 , The Complete Amino-Acid Sequence (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125
Horticultural Research Institute (Scottish), Dundee Promotion of Dr C H Cadman to Senior Principal Scientific Officer, 215
Horton-Smith, Dr C , and others Limitations of the Periodic Acid–Schiff Technique for the Demonstration of Stages of *Eimeria* in Tissues, 1315
Horvath, Dr I , and Varga, J M Enzymic Inactivation of Trichothecin and Crotocin, 88
Horvath, Dr I , and others Possible Causes for Production of Isoleucine by *Streptomyces rimosus*, 641
Horwood, J F , and Forss, D A At the Third Australian Spectroscopy Conference (Methods for Handling Micro-quantities of Samples for Absorption Spectrometry), 928
Hosoya, Toichiro, and Ui, Nobuo Demonstration and some Properties of Peroxidase in Pig Thyroid Gland, 659
Hospitals (British) History of (Third British Congress on the History of Medicine and Pharmacy), 1241
Host Cellular Dose and Age of, in the Induction of Tolerance (Dr L Brent and Dr G Gowland), 1265
Host Plant Relationship between Phage Type and, in *Pseudomonas mors-prunorum* Wormald (J E Crosse and Constance M E Garrett), 379
Hot Springs of Tiberias (Israel) Thermophilic Micro-organism of Uncertain Taxonomic Status from the (David Kahan), 1212
Hotelling, Harold (Essays in Honor of) Contributions to Probability and Statistics (edited by Ingram Olkin, S G Ghurye, Wassily Hoeffding, William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
Hough, Dr J S Appointed senior lecturer in charge of the Sub-Department of Malting and Brewing in the Department of Biochemistry in the University of Birmingham, 406
Houghton, Dr L E , and others Mucoproteins of Bronchial Mucus, 1269
House of Commons Second reading of the Education Bill, 800
  Debate on the Control of Government Expenditure on Research and Development, 1239
House of Lords Debate on Technical and Scientific Man-power and Research, 1105
  Debate on the Shortage of Medical Men, 1239
House Cricket, *Acheta domesticus* L Home and Distribution of the (Dr A S K Ghouri), 1000
Housing and Local Government, Ministry of Fourth Progress Report of the Standing Technical Committee on Synthetic Detergents, 1142
Houwink, A L , and Spit, B J (edited by) Proceedings of the European Regional Conference on Electron Microscopy (Delft, 1960), *review* by Prof R D Preston, 1220
Howard Dr B H Awarded a 1961 Senior Research Fellowship by the New Zealand Department of Scientific and Industrial Research, 210 , work of, 210
Howatson, Dr A F The Fine Structure of Viruses, 611
Howden, Dr G F (Rothschild, Jennifer and) Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase, 283
Howe, Prof R M Design Fundamentals of Analog Computer Components, *review* by Dr M V Wilkes 489
Howes, F N Cork and the Cork Tree, *review*, 852
Howie, Dr D I D Spawning Mechanism in the Male Lugworm, 1100
Howlett, Dr J Appointed head of the *Atlas* Computer Laboratory of the National Institute for Research in Nuclear Science, 918 , work of, 918
Hsia, Dr David Yi-Yung Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with Liver Glycogen Disease (Von Gierke's Disease), 266
Hubble Atlas of Galaxies (Dr Allan Sandage), *review* by Prof R O Redman, 838
Hudnik-Plevnik, T , and Stocken, Dr L A Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet, 554
Hudson, Dr R G S Appointed to the chair of geology and mineralogy at Trinity College, Dublin, 1022 , work of, 1022
Hudson, Dr Ralph P Appointed chief of the Heat Division of the United States National Bureau of Standards, 309
Huehns, Dr E R , and others Haemoglobin α^A, 1057
Hugh-Jones, Dr P Breathing (Variation of Ventilation and Blood-Flow in Different Parts of the Lungs in Health and Disease), 107
Hughes, B N Appointed a director of Chapman and Hall, Ltd , as chief editor for scientific and technical books, 406
Hughes, K L Awarded a B B C Research Scholarship, 115
Hughes Medal of the Royal Society awarded to Prof A H Cottrell, 606, 907 , work of, 907
Hull, Dr R At the First British Insecticide and Fungicide Conference (Use of Systemic Insecticides for Virus Control in Potatoes and Sugar Beet), 1140
Hull, Dr R , and Hurst, Dr E W Research on the Chemotherapy of Virus Diseases (Structure Activity in various Heterocyclic Compounds), 806
Hulliger, Lotte, and others Somatic Chromosomes of the Gorilla, 225
Hulsmann, Dr W C Relationship between Oxidation of Isocitrate and Metabolism of Fatty Acids in Rabbit-Heart Sarcosomes, 1153
Hultqvist, Bengt, and others A Morning Discontinuity in the Orientation of Quiet Auroral Arcs, 956

Human Beings Concentration of Inhaled Cerium-144 in Pulmonary Lymph Nodes of (K Liebscher, Dr T Schonfeld and A Schaller), 1308
Human Blood Platelets Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of (A Gaarder, Dr J Jonsen, Prof A Laland, Dr A Hellem and Prof P A Owren), 531
Human Bone Marrow treated with Human Deoxyribonucleic Acid Formation of Different Haemoglobins in Tissue Culture of (Prof Lorraine M Kraus), 1055
Human Deoxyribonucleic Acid Formation of Different Haemoglobins in Tissue Culture of Human Bone Marrow treated with (Prof Lorraine M Kraus), 1055
Human Depot Fat An Unusual Major Fatty Acid Component in (Dr D S McLaren and W W C Read), 265
Human Foetus P_1 Antigen in the (Elizabeth Ikin, Dr H E M Kay, J H L. Playfair and Dr A E Mourant), 883
Human *7S* γ-Globulin Serological Evidence of a Chromatographic Subfractionation of (Ulf Nilsson), 1301
Human γ-Globulins (Pathological) Resolution of, by Starch-Gel Electrophoresis (J P Binette and K Schmid), 732
Human Growth Hormone and Sheep Interstitial Cell Stimulating Hormone , Complement-fixing Antibodies to (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Human Haemoglobin Chromium-51 Tagging of the α-Chain of (Prof Amoz I Chernoff), 327
Human Intervertebral Disk Polysaccharide Content of the Prolapsed Nucleus Pulposus of the (Dr F Happey, Dr A Wiseman and A Naylor), 868
Human Leucocytes and Thrombocytes Specific Antigens of (Nechama Gilboa-Garber and Dr A Nelken), 466
Human Malaria Gamma-Globulin and Acquired Immunity to (Dr S Cohen, Dr I A McGregor and S Carrington), 733
Human Megaloblasts Abnormal Globin Formation in (Prof Austin S Weisberger and Ernest P Noble), 1261
Human Milk Lysozyme from (Dr Pierre Jolles and Jacqueline Jolles), 1187
Human Parasites, *review* by Dr G Lapage, 197
Human Placenta and Kidney Closely Related Antigens in (Dr Raymond William Steblay), 1259
Human Plasma Isolation of an α_2-Globulin from (Dr M Steinbuch and Dr J Loeb), 1196
  Role of Hageman Factor in the Activation of Vasodilator Activity in (Dr M E Webster and O D Ratnoff), 180
Human Red Blood Cell Metabolism of the (Dr D Mendelsohn), 619
Human Tissue A New Method for Local Chemical Analysis of (Robert C Mellors and Kenneth G Carroll), 1090
  Producing Transplantable, in the Laboratory (Dr D Petrucci), 21
Human Tissue Cultures Growth of Contagious Pustular Dermatitis Virus in (Prof A Macdonald and T M Bell), 91
Human Urine Identification of an Amylobarbitone Metabolite in (J V. Jackson and M S Moss), 553
Human White Cells Culture of, using Differential Leucocyte Separation (James Hastings, Stanley Freedman, Orlando Rendon, Herbert L Cooper and Kurt Hirschhorn), 1214
Human, Cow and Rabbit Native Fibrin Powders as Anticoagulants (Dr A L Copley and Beverly Becher), 568
Humanities of Science, *review* by Dr W P D Wightman, 825
Humber Laboratory at Hull of the Department of Scientific and Industrial Research Open Days, 309 , Open Days (D L Nicol), 1027
Hummel, R W Production of High Molecular Weight Products from the Irradiation of Methane with 4-MeV Electrons, 1178
Hundley, L L (Bonner, W A , and) Scanning Techniques in Biological and Medical Microscopy (Techniques for Simultaneous Illumination of the Specimen with both Visible and Ultra-violet Light), 1031
Hundley, L L (Montgomery, Dr P O'B , and) Television Microscopy—a Flying-Spot Interference Television Microscope, 1059
Hunger—Can it be Averted ? (edited by Sir E John Russell and Dr. Norman C Wright), 417
  Conquest of (Dr W R Aykroyd), 417
Hunt, C C Muscle Receptors (Mechanisms by which Sensory Endings initiate Electrical Discharges), 806
Hunt, O D *Obituary* of Dr G H Young, 917
Hunt, P Francis Orchids of Trinidad and Tobago, *review*, 831
Hurd, Dr Paul De Hart Biological Education in American Secondary Schools, 1890-1960, *review*, 1007
Hurley, Dr Robert J , and others Acetylcholine in Sweat in Fibrocystic Disease of the Pancreas, 77
Hurschleifer, Prof Jack, and others Water Supply, *review* by Prof W G V Balchin, 853
Hurst, Dr E W (Hull, Dr R , and) Research on the Chemotherapy of Virus Diseases (Structure Activity in various Heterocyclic Compounds), 806
Hurwitz, H M B , and Millenson, Dr J R Animal Behaviour (Control of Behaviour by Reward), 208
Hutchinson, Dr Edward C (Yates, Dr Peter O , and) Cerebral Infarction —the Role of Stenosis of the Extracranial Cerebral Arteries (Medical Research Council, Special Report Series No 300), 319
Hutterer, Ferenc, and others Nature of Increased Protein and DNA in Chronic Hepatic Injury, 886
Hutton, Prof S P Measurement of Water-Flow, *review*, 842
Huxley, Sir Julian The Better Use of the World's Fauna for Food, 1112
Hvinden, T , and Lillegraven, A Caesium-137 and Strontium-99 in Precipitation, Soil and Animals in Norway, 1144

Hyde, Dr A J Colloidal Systems, 929
Hyder, S B , and Gupta, B K Radio-Luminescence in Sodium Chloride and Potassium Chloride, 60
Hydraulic Conductivity (Soil) Method of measuring, *in situ* (Prof J N Luthin), 383
Hydraulic Measurements Hydrometry—Theory and Practice of (Prof Adam T Troskolanski), *review* by Prof S P Hutton, 842
Hydro- und Aerodynamik (Mechanik,) Gesammelte Abhandlungen zur Angewandten (Ludwig Prandtl), (herausgegeben von Walter Tollmien, Hermann Schlichting und Henry Gortler , schriftlietung F W Riegels), Teile 1-3 *review* by M James Lighthill, 841
Hydrocarbon Combustion Inhibition of the Formation of 3,4-Benzpyrene during (R Long and S K Ray), 353
Hydrocarbon Insecticides (Chlorinated) Effect of, on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase (Jennifer Rothschild and Dr G F Howden), 283
Hydrocarbons Evolution of, from Impure Titanium Getters (L Holland, L Laurenson and P G W Allen), 749
Hydrocarbons (Aromatic), in Fluid Media Evidence for the Photo-Association of (Dr B Stevens), 725
Hydrochloride Isomers Mannosyl D-Glucosame—6-O-Mannosyl D-Glucosamine Hydrochloride (Dr S A Barker, Dr K Murray, Prof M Stacey and Dr D B E Stroud), (143, July 8, 1961), *erratum*, 710
Hydrocortisone Effect of, on Uptake of Iron-59 in Incubated Rat Red Cells *in vitro* (Peggy Clark), 667
Hydroelectric Schemes The Angara–Yenisei (P M Dmitrievsky), 114
Hydrogen (Atomic) Excitation of the 2*s* State of, by Electron Impact (Dr B L Moiseiwitsch), 545
Hydrogen Bonding in Alkyl Phosphonic and Alkyl Phosphonothionic Acids (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Hydrogen Bonding of Water in Bovine Serum Albumin Solutions Nuclear Magnetic Resonance Spectroscopy of Proteins—the (F A Bovey), 324
Hydrogen Bonding (Intramolecular) Participation of Imidazole in (Prof A Lukton), 422
Hydrogen Ions (High-Energy) Emission of Ultra-Violet and Visible Radiation from Metals by the Impact of (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Hydrogen Isotopes Purification of, by Self-Displacement Chromatography at Low Temperatures (Dr T R Phillips, D R Owens and A G Hamlin), 1067
Hydrogen Overvoltage at Cathodes of 77 per cent Palladium and 23 per cent Rhodium (J C Barton and Dr F A Lewis), 549
Hydrogen and Methane (Atmospheric) Isotopic Composition of (A E Bainbridge, Prof H E Suess and Irving Friedman), 648 , (K. F Bishop, R T Taylor and A E J Eggleton), 649
Hydrogen and Stratospheric Water (Atmospheric Methane,) Origin of High Tritium Content of (Dr Richard Wolfgang), 1279
Hydrolases in the Digestive Tract of Vertebrates Chitinase, an Addition to the List of (Dr Charles Jeuniaux), 135
Hydrolysate (Alginase) A New Unsaturated Uronide isolated from (Isami Tsujino and Tsuneyuki Saito), 970
Hydrolysis of Hippuric Acid in Electrolytic Desalters (Dr E McEvoy-Bowe), 1072
Hydrolysis of α-Sulphoquinovosides by β-Galactosidase (Isao Shibuya and Prof A A Benson), 1186
Hydrolysis (Enzymatic), of Biliary Conjugates of 3,4-Benzpyrene on Filter Paper (Dr Hans L Falk, Sung Suk Lee and Prof Paul Kotin), 973
Hydrolysis (Specific Partial), of Nucleic Acids in Nucleotide Sequence Studies (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Hydrometeorological Service The Soviet (R F Zobel), 1141
Hydrometry—Theory and Practice of Hydraulic Measurements (Prof Adam T Troskolanski), *review* by Prof S P Hutton, 842
5-Hydroxy-3-indoleacetamidine—a New Type of Blocking Agent against 5-Hydroxytryptamine (Dr Laszlo Gyermek), 465
Hydroxybenzoate (Methyl) Action of, on Nervous Conduction (Dr P W Nathan and T A Sears), 668
α-Hydroxyethylamide (Lysergic Acid) Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of, by *Claviceps paspali* Stevens and Hall (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Hydroxylation (Aromatic) *In vivo* and *in vitro* Inhibition of, by Riboflavin (K H Harper and Dr G Calcutt), 165
8-Hydroxyquinoline and Alloxan D-Penicillamine as an Antidote to (Makoto Matsuda and Prof Katashi Makino), 261
5-Hydroxytryptamine 5-Hydroxy-3-indoleacetamidine—a New Type of Blocking Agent against (Dr Laszlo Gyermek), 465
5-Hydroxytryptamine and Noradrenaline A Central Action of (Dr D. R Curtis and Dr R Davis), 1083
Hygiene (Mental), American Foundation for *Mental Health Book Review Index*, Vol 6, No 11, 113
Hypercholesterolaemia in Intact and Hypophysectomized Rats Effect of Sheep Pituitary Extract on (Dr Russel M Barakat) 71
Hyperfine Splitting Nuclear Spin of Protoactinium-231 from (E. W. T Richards, A Ridgeley, N J Atherton and H S Wise), 444
Hypergeometric Functions (Special Confluent), for Asymptotic Solutions of Differential Equations of the Second Order Tables of Airy Functions and (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Hyperglycaemic Factor Occurrence of a, in the Corpus Cardiacum of an Insect (J E Steele), 680
Hypersensitivity (Immediate (Anaphylactic)) Transfer of, by Homologous Bone Marrow or Spleen Cells (Dr V Stanković and S Vlahović), 762
Hypertension (Essential) Prolonged Biological Half-Life of Sodium-22 in Patients with (Dr Lewis K Dahl, Malcolm G Smilay, Lawrence Silver and Sanford C Spraragen), 267
Hypertensive Effects of Bradvkinin in Rats (H Croxatto and J Belmar), 879
Hypertensive Rats (Intact and) Effect of Monovalent Cations on the Blood Pressure of (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Hypertensive (Anti-) Properties A Nondiuretic Benzothiadiazine with (Dr Alan A Rubin, Franklin E Roth and Martin M Winbury), 176, *erratum*, 802
Hypervelocity Test Facilities Mach Tables for Real Gas Equilibrium Flow of Air in, with Total Temperatures to 10 000° K (K L Goin), 308
Hypervitaminosis A in *Xenopus laevis* Alterations in Connective Tissue and Intestine produced by (Gerald Weissmann), 235
Hypogastric Nerve Stimulation Effect of some Smooth Muscle Stimulants on the Motor Response of the Isolated Guinea Pig Vas Deferens to (Dr Nils O Sjostrand), 1190
Hypomagnesaemia in the Ruminant · Dietary Citrate and (A W A Burt and D C Thomas), 1193
Hypophysectomized Rats Failure of the Purified Growth Hormone to restore the Size of the Kidneys in (Dr T Astarabadi), 270
Hypophysectomized Rats (Intact and) Effect of Sheep Pituitary Extract on Hypercholesterolaemia in (Dr Russel M Barakat), 71
Hypopituitary Dwarfs Growth Hormone Content of Serum in Infants, Children, Adults and (Dr J Girard, Dr M Vest and Dr N Roth), 1051

Hypothermia (Mild) Enhanced Effect of Total-Body X-Irradiation in Mice under (Dr H J G Bloom and K B Dawson), 232
Hypothesis (Megashatter Cone), of the Origin of Lunar Volcanoes (A J Cohen), 346
Hypothesis (Quantitative) Role of Water-regulating Mechanisms in Amphibian Morphogenesis—a (Peter Tuft), 1049
Hypothesis (Unitary) Mechanism of Streptomycin Action on Bacteria—a (Dr Charles R Spotts and Prof R Y Stanier), 633

ICE Crystals at Low Temperatures Investigation with the Electron Microscope of the Sublimation of (Prof Tokio Nei), 1177
Ice Nucleus Requirements of an (G R Edwards and L F Evans), 448
Ice Plates Formation of Cracks in, by Thermal Shock (L W Gold), 130
Icelandic Waters Fluctuations in Marine Populations in (G Bodvarsson and J Jonsson), 768
Ideas on the Structure of Metals before 1890 A History of Metallography—the Development of (Prof Cyril Stanley Smith), *review* by Prof F C Thompson, 843
Ideas (Major), in the Physical Sciences from the Earliest Times to the Present The Search for Order—the Development of the (Cecil J Schneer), *review* by Prof Herbert Dingle, 901
Identification of an Amylobarbitone Metabolite in Human Urine (J V Jackson and M S Moss), 553
Identification of Antibody in β_2-Globulins of Mouse Serum and Ascitic Fluid (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
Identification of the Chromosome Complements of New-born and Adult Living Mice (R G Edwards), 1316
Identification and Determination (Separation,), of the Fatty Acids of Montan Wax (D R Hewett, P J Kipping and P G Jeffery), 65
Identification, Properties and Uses of Indian Timbers, *review* by Dr C R Metcalfe, 1110
Identification (Isolation and), of Rhamnose from Rabbit Skin (Ina Malawista and Prof E A Davidson), 871
Ikeda, Prof Yonosuke (Takeichi, Chiyoko, and) A Heterocaryon possessing Haploid and Diploid Nuclei, 1317
Ikin, Elizabeth, and others P_1 Antigen in the Human Foetus, 883
Ileum Technique (Isolated) Antigenicity of Guinea Pig Testicular Cells grown in Cell Culture as determined by the (Dr Seymour Katsh and Dr Russell T Jordan), 770
Imhoff, Roy K Production of Aortic Occlusion resembling Acute Aortic Embolism Syndrome in Cats, 979
Imidazole Participation of, in Intramolecular Hydrogen Bonding (Prof A Lukton), 422
Immediate (Anaphylactic) Hypersensitivity Transfer of, by Homologous Bone Marrow or Spleen Cells (Dr V Stankovic and S Vlahovic), 762
Immunity (Acquired), to Human Malaria Gamma-Globulin and (Dr S Cohen, Dr I A McGregor and S Carrington), 733
Immunity (Mengo–Semliki Virus) Acrolein and (Dr George F Kamen), 986
Immunity and Allergy (Infection,), in Acute Radiation Diseases Problems of (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Immunization in Communicable Disease Control The Role of (United Nations, World Health Organization, Public Health Papers No 8), 20
Immunization against Disease, 20
Immunization (Auto-) and Liver Cirrhosis (Dr W Mori and Dr T Suzuta), 41
Immuno-electrophoresis of the Proteins of Gastric Juice Agarophoresis and (M Tenorova, E Stuchlikova and J Kořinek), 763
Immunology and Oncology Conceptual Advances in (University of Texas Sixteenth Annual Symposium on Fundamental Cancer Research), 1132
Impact of High-Energy Hydrogen Ions Emission of Ultra-Violet and Visible Radiation from Metals by the (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Impact of Science on Society, Vol 11, No 3, 919
Impact (Electron) Excitation of the 2*s* State of Atomic Hydrogen by (Dr B L Moiseiwitsch), 545
  Experimental Detection of Auto-Ionizing Transitions in Krypton by (John F Burns), 651
Imperial College of Science and Technology, London Postgraduate Courses, 115
  Grant of £13,500 from the Wellcome Trust, for the purchase of a nuclear magnetic resonance spectrometer, 212
  Appointment of Dr J Clunie to a readership in mathematical analysis, 507
  Appointment of Prof K G Denbigh to the Courtaulds chair of chemical engineering, 710
  Title of professor of organic chemistry conferred on Dr L N Owen, 710
  Commemoration Day Address, Research in the Universities (Rt Hon Viscount Hailsham), 787
  Title of professor of theoretical physics conferred on Dr P T Matthews, 802
  Research Report 1958-61 of the City and Guilds College, 802
  Appointment of J L Stollery to the readership in aeronautics, 922
  Title of professor of molecular spectroscopy conferred on Dr A G Gaydon, 922
  Nematology at the (Prof P G Peters), 1027
  History of Science and Technology at the, 1131
  Appointment of Dr J R Butler as reader in pure geochemistry, 1132
  Appointment of Dr J C Anderson as reader in electrical engineering, 1132
  Title of professor of electrical engineering conferred on Dr J H Westcott, 1132
Imperial Forestry Institute, Oxford Re-named the Commonwealth Forestry Institute, 802
Importance of Cell Division for Antibody Production in an *in vitro* System (R W Dutton), 462
Importance of Osmotic Potential as a Component of the Total Potential of the Soil Water on the Movement of Nematodes (C D Blake), 144
Importance (World) Parasites of (Parasitology Group of the Institute of Biology Autumn Meeting on), 21
Important Factors for the Regeneration of Naked Yeast Protoplasts Physical Conditions as (Dr O Nečas), 580
Improved Benzidrine Sugar Reagent for Paper Chromatograms (Bock G Chan and Prof J C Cain), 69
Improved Gas Chromatography of Unesterified Fatty Acids (P Jowett and B J Horrocks), 966
Impure Titanium Getters Evolution of Hydrocarbons from (L Holland, L Laurenson and P G W Allen), 749
In-Attention (Attention and), in Neurophysiology (L Goldie and J M Green), 1116
Inactivation of A-Methopterin by the Acetylating Enzyme System from Pigeon Liver (V Krishnamurthy and Beatriz M Braganca), 68
Inactivation of Rous Virus by Phospholipase A (H A Drayton), 896
Inactivation (Enzymic), of Trichothecin and Crotocin (Dr I Horvath and J M Varga), 88
Incidence of Chagas' Disease in the Matalaque Region, Southern Peru (Eleazar Cordova), 921
Incipient Dioecy in Pimento (G P Chapman and S K Glasgow), 1205
Inclusion Bodies containing Deoxyribonucleic Acid Detection of, by means of Autoradiography (Dr Moshe Aronson and Dr Sanford S Elberg), 981
Inclusions (Ferromagnetic), in Nucleic Acid Samples (W M Walsh, jun, R G Shulman and R D Heidenreich), 1041
Incorporation of Amino-Acid into Normal and Regenerating Rat Liver Effects of Irradiation on the (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from Rat Liver Nuclei (K R Rees, Hazel F Ross and G F Rowland), 171
Incorporation of Molecular Oxygen during Microbial Utilization of Olefins (Tomoyuki Ishikura and J W Foster), 892
Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays Effects of Iodoacetic Acid on the (Dr M Quintiliani, M Boccacci and L Tentori), 573
Incorporation of Tritiated Thymidine in *in vitro* Culture Uptake and (Dr W M Rigal), 768
Incorporation of Trivalent Cations in Crystalline Potassium Cholide (Dr Marian E Hills and Prof Allen B Scott), 1066
Increase in the Dense Cytoplasmic Bodies in Radiation-induced Giant Cells of the Cultured Fibroblast (Dr A F Hayward), 891
Increase in Distribution of *Deraeocoris olivaceus* (Dennis Leston and G E Woodroffe), 188
Increase in Environmental Radioactivity Report of the Steering Committee for Nuclear Energy and Council Decision on the Establishment of a Supervision and Emergency Warning System in Cases of (Organization for European Economic Co-operation), 31
Increase in the Rate of Erythropoiesis Increased Iron Absorption without (Dr Gerald A Mendel), 878
Increased Iron Absorption without Increase in the Rate of Erythropoiesis (Dr Gerald A Mendel), 878
Increased Protein and DNA Nature of, in Chronic Hepatic Injury (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and Hans Popper), 886
Incubated Rat Red Cells *in vitro* Effect of Hydrocortisone on Uptake of Iron-59 in (Peggy Clark), 667
Independence of Voltage of the Membrane Conductance of Rabbit Ventricular Fibres Evidence for (Dr Edward A Johnson and J Tille), 663
Index Mental Health Book Review (American Foundation for Mental Hygiene), Vol 6, No 11, 113
Index (Bibliography and), of Geology and Allied Sciences for Wales and the Welsh Borders, 1897-1958 (D A Bassett), *review* by V A Eyles, 491
India Cotton in, Vol 2 (R H Dastur, Prof R D Asana, K Sawhney, S M Sikka, R S Vasudeva, Quadruddin Khan, V P Rao and B L Sethi), Vol 3 (C Nanjundayya R L N Iyengar, W R Natu, M B Ghatge, K S Murti, C B Parikh, B L Sethi and D N Mahta), Vol 4 (S M Sikka, Arjan Singh, Avtar Singh, P D Gadkari, R Balasubrahmanyan, N K Iyengar, K Sawhney, V K Bederker, B G Patel P S Pandya, V N Paranjpe and N S Panigrahi), *review* by Prof S C Harland, 200
India, Botanical Survey of Appointment of Prof H Santapau as superintendent, 606
India (Ancient and Medieval) History of Sciences in (National Institute of Sciences of India Symposium on), 27
Indian Central Tobacco Committee Indian Tobacco, *review*, 1007
Indian Council of Agricultural Research Entomological Monographs No 1, Contributions to the Systematics of Oriental Termites (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Indian Council of Scientific and Industrial Research Botanical Monograph No 1, Gnetum (P Maheshwari and Vimla Vasil), *review* by Dr C R Metcalfe, 1006
  Coir, its Extraction, Properties and Uses, *review*, 1007
Indian Council of Scientific and Industrial Research (Chemical Research Committee) Symposium on Carbohydrates, Cellulose and Cellulose Industries, 609
Indian Ephemeris and Nautical Almanac for 1962, 1240
Indian Timbers Identification, Properties and Uses of, *review* by Dr C R Metcalfe, 1110
Indian Tobacco (Indian Central Tobacco Committee), *review*, 1007
Indian Woods (Dr K A Chowdhury and S S Ghosh), Vol 1, Dilleniaceae to Elaeocarpaceae, *review* by Dr C R Metcalfe, 1110
Indians (Peruvian) Haptoglobin and Transferrin Types in (Dr Eloise R Giblett and Dr William R Best), 1300
Indirect Fick Procedure (New), for the Determination of Cardiac Output (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
InBi de Haas–van Alphen Effect in (A C Thorsen and T G Berlincourt), 959
Individual Flies on Insecticidal Deposits A Technique for exposing (H C M Parr and J E H Grose), 475
Indole-3-Acetic Acid (IAA) Effect of, on Phosphorus Metabolism in the *Avena* Coleoptile (A Sen Gupta and S P Sen), 1291
  Oxidative Decarboxylation of, by Mangani-Versene and by Wheat Leaf Enzyme (Prof R A Abramovitch and K S Ahmed), 259
Indole-3-Acetic Acid labelled with Carbon-14 Isolation of an Unknown Auxin from a Solution of (Prof J H M Henderson), 1076

Induced Formation of Malic Enzyme in *Lactobacillus arabinosus* (17-5) Nutritional Requirements for the (Sheila M Bocks), 89
Inductance Coils, *review* by Prof A H M Arnold, 845
    The Theory and Design of (Dr V G Welsby), second edition, *review* by Prof A H M Arnold, 845
Induction of a Light Requirement for the Germination of Lettuce Seed by Naringenin, and its Removal by Gibberellic Acid (Dr I D J Phillips, 240
Induction of Tolerance Cellular Dose and Age of Host in the (Dr L Brent and Dr G Gowland), 1265
Induction of Tumours in Mice with Tritiated Thymidine (Hermann Lisco, Renato Baserga and Walter E Kisieleski), 571
Induction (Apparent), of Malignant Tumours by Organ-Specific Antiserum (Prof H N Green), 1201
Induction Furnaces Design of Laboratory High-Temperature (P H Dundas), 114
Inductive Probability (John Patrick Day), *review* by F I G Rawlins, 695
Industrial Application Radiation—Use and Control in (Dr Charles Wesley Shilling), *review* by B E Jones, 855
Industrial Education (Commercial and), British Association for Election of Sir Willis Jackson as president, 115
    Annual Conference (Education and Training on the Continent of Europe), 718
    Report on Education and Training in France, 920
Industrial Food Scientists and Technologists in the United Kingdom Training of (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 302
Industrial Research and Development in the United States, 809
Industries (Cellulose) Carbohydrates, Cellulose and (Chemical Research Committee of the Indian Council of Scientific and Industrial Research Symposium on), 609
Industry Chemistry in, *review* by Dr M J Newlands, 902
    Ergonomics in (Proceedings of the Conference organized by the Department of Scientific and Industrial Research), 113
    Funds for Research and Development in, 1958 (United States National Science Foundation, Surveys of Science Resources Series, NSF 61-32), 809
    Health in (Prof R C Browne), *review* by T H Hawkins, 856
    Progress in, 689
Industry (British Ceramic) Rocks and Minerals used by the (Exhibition of, at the Geological Museum, London), 21
Industry (Gas) Research and Development in the, 306
Industry (Leather) Research in the (R G Mitton), 612
Industry and Agriculture, Institute for the Encouragement of Scientific Research in (Brussels) Annual Report for 1960, 28
Infant Rats Interrelationship between Fat and Sugar Metabolism in (P Hahn, O Koldovsky, V Melichar and M Novak), 1296
Infants, Children, Adults and Hypopituitary Dwarfs Growth Hormone Content of Serum in (Dr J Girard, Dr M Vest and Dr N Roth), 1051
Infarction Cerebral—the Role of Stenosis of the Extracranial Cerebral Arteries (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Infection with Very Low Doses Multiplication of Mouse-adapted Influenza Virus in Mouse Lungs after (F Link and J Raus), 478
Infection (Experimental Sendai Virus) Influence of Age of Mice on the Recovery from (Dr Leon Sawicki), 1258
Infection (Tomato Mosaic Virus) Influence of, on the Hollow Fruit Condition of Tomatoes (D J Harrison), 90
Infection, Immunity and Allergy in Acute Radiation Diseases Problems of (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Infections (Virus) Mechanisms of (Royal Society Discussion on), 1246
Infestation Control in Stored Food-Grains Pre-Harvest Prophylaxis for (S K Majumder, K Krishnamurthy and S Godavari Bai), 375
Infinite-Dimensional Algebras, *review* by Dr F Smithies, 201
Inflammation Leucocyte Migration in (Sir Howard Florey and L H Grant), 801
Influence of Adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on Membrane Filters (N D Harris and J P Richards), 87
Influence of Age of Mice on the Recovery from Experimental Sendai Virus Infection (Dr Leon Sawicki), 1258
Influence of the Age of Pollen and Stigmas on Sex Determination in Hemp (Regina Laskowska), 147
Influence of Anaerobic Glycolysis on Release of Histamine in the Guinea Pig and Rat Anaphylactic Reaction *in vitro* (A Prouvost-Danon and Dr H Moussatche), 361
Influence of Date of Flushing on Flowering in *Pinus banksiana* (Philip R Larson), 82
Influence of Larval Environment on Adult Size and Fecundity in the Moth *Panaxia dominula* L (L M Cook), 282
Influence of some Organic Salts on the Absorption of Potassium by Vermiculite (Prof M M Mortland), 481
Influence of *p*H and Urea on the Ultra-violet Fluorescence of several Globular Proteins (Dr R F Steiner and H Edelhoch), 873
Influence of the Synergetic Action of Polyethylene Glycol and Dyes Behaviour of Protozoa under the (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Influence of Tomato Mosaic Virus Infection on the Hollow Fruit Condition of Tomatoes (D J Harrison), 90
Influence of Vitamin D Free Amino-Acids in Rachitic Epiphyseal Cartilage of Albino Rat and the (G V G Krishna Rao), 269
Influence (Modifying) on Linear Trend of *F*-Region Electron Density with Sunspot Number Atmospheric Scale Height as a (Jean M Bullen), 542
Influence (Rootstock), on the Flowering of Seedling Apples (H M Tydeman), 83
Influenza Virus Attachment of Antibody to (Dr K J Lafferty and S J Oertelis), 764
Influenza Virus (Mouse-adapted), in Mouse Lungs Multiplication of, after Infection with Very Low Doses (F Link and J Raus), 478
Influx (Sodium), and Excitation in Uterine Smooth Muscle (Prof C Y Kao, Dr D Zakim and Dr F Bronner), 1189
Infra-red Spectra of Lead and other Carbonates A Difference Band of a Fundamental and a Lattice Mode in the (C J H Schutte and K Buijs), 351
Ingestion (Urea) Effect of, on Parotid Salivation in Sheep (A D Wilson), 271
Inglis, Dr James A, and Halliday, Dr June W Thromboplastic Activity of Red Cells, 882
Ingram, Prof D J E University College of North Staffordshire—Extension to Department of Physics, 912
    Electron Spin Resonance (Structural Information provided by Electron Resonance Measurements on Single Crystals), 1034
Ingram, G Microchemical Techniques (Direct Ignition in an Oxygen-filled Chamber at 850° C for the Determination of Carbon, Hydrogen, Halogens and Sulphur), 411
Ingram, Prof Vernon Hemaglobin and its Abnormalities, *review* by Dr C A Allison, 835
Inhalation Amounts of Oxides of Nitrogen and Carbon Monoxide in Cigarette Smoke, with and without (H Bokhoven and H J Niessen), 458
Inhaled Cerium-44 Concentration of, in Pulmonary Lymph Nodes of Human Beings (K Liebscher, Dr T Schonfeld and A Schaller), 1308
Inherited Casein Variants in Cow's Milk (Dr R Aschaffenburg), 431
Inhibited Oviposition by Females of *Gryllus assimilis* (F), induced by Radioactive Males, using L-Methionine-Methyl-^{14}C (Dr A A Abdel-Malek and D K McE Kevan), 681
Inhibition of Dopamine β Oxidase by Adrenalone (Prof M Goldstein and J F Contrera), 1081
Inhibition of the Formation of 3,4-Benzpyrene during Hydrocarbon Combustion (R Long and S K Ray), 353
Inhibition of Lysozyme by 'Suramin' (Dr Iwo Lominski and Samuel Gray), 683
Inhibition of Microsomal Protein Synthesis produced by Dimethylnitrosamine Counteraction by Cysteine of Glycogenolysis and (Dr P Emmelot and I H Mizrahi), 42
Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei Substrate Specificity and—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Inhibition (Excitation and), in Molluscan Central Synapses Cholinergic Transmission Mechanisms for both (Dr L Tauc and Dr H M Gerschenfeld), 366
Inhibition (*In vivo* and *in vitro*), of Aromatic Hydroxylation by Riboflavin (K H Harper and Dr G Calcutt), 165
Inhibitor A Potent, Non-Toxic Plant-Growth, from an Antibiotic Fermentation (Dr L G Nickell and W D Celmer), 1098
Inhibitor of Transport of Amino-Acids in Brain Phenylalanine as (K D Neame), 173
Inhibitor (Trypsin), in Wholewheat Flour (G Shyamala, Barbara M Kennedy and Prof R L Lyman), 360
Inhibitors of Neural Differentiation in Chick Embryos Localization of (Dr A K Katoh), 997
Inhibitors (Non-steroid), of Pituitary Gonadotrophic Function (G E Paget, A L Walpole and D N Richardson), 1191
Inhibitors (Trypsin), in the Sera of various Animals Distribution of (S Nakamura and T Wakeyama), 1077
Inhibitory Phenomena and 'Habituation' at the Neuronal Level (B Holmgren and S Frenk), 1294
Inhibitory Properties of the Catecholamines (Prof E G McGeer, P L McGeer and H McLennan), 563
Injected Norepinephrine Particle-bound and Free Catecholamines in Dog Hearts and the Uptake of (A Wegmann and K Kako), 978
Injected (Intraventricularly) Anti-N Caudatus Antibody Effects of, on the Electrical Activity of the Cat Brain (Dr Lj Mihailović and Dr B D Janković), 665
Injection of Herring-Sperm Deoxyribonucleic Acid Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following (Prof A Stolk), 1215
Injection (Homologous Spleen Cell), in Adult Mice Acquired Tolerance to Homografts produced by (Ronald D Guttmann and J Bradley Aust), 564
Injury (Chronic Hepatic) Nature of Increased Protein and DNA in (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and Hans Popper), 886
Injury (Translocated Heat), in Plants (Prof C E Yarwood), 887
Inkson, R H E, and others Cation-Exchange Capacities of Tissues of Higher and Lower Plants and their related Uronic Acid Contents, 142
Inner Ear Mode of Action of the Efferent Olivo-Cochlear Bundle on the (Dr J E Desmedt and Dr P Monaco), 1263
Inocybe Species Occurrence of Sedoheptulose in Carpophores and Basidiospores of (Robert G Benedict, Prof Varro E Tyler, jun, Lynn R Brady and Daniel E Stuntz), 1080
Inorganic Analysis Quantitative (Prof R Belcher and Dr A J Nutten), second edition, *review* by Dr G Kakabadse, 836
Inorganic Chemical Analysis Text-Book of, *review* by Dr G Kakabadse, 836
Inorganic Condensed Phosphates Protection by, against the Lethal Effects of X-Rays (J H Barnes and J St L Philpot), 574
Inotropic Activity of Calcium Modification of the, by Potassium (Winifred G Nayler), 268
Insect Occurrence of a Hyperglycaemic Factor in the Corpus Cardiacum of an (J E Steele), 680
Insect, *Calliphora vomitoria* L Intestinal Proteinases in an (Dr Alastair Fraser, Richard A Ring and Robin K Stewart), 999
Insect Choline Acetylase, Condensing Enzyme and Acetylkinase Effect of Chlorinated Hydrocarbon Insecticides on (Jennifer Rothschild and Dr G F Howden), 283
Insect Parasites Medicine and, *review* by Prof D S Bertram, 298
Insect Polymorphism (Prof O W Richards), 412
Insect Tissues Retinene-I in (Michael H Briggs), 874
Insecticidal Deposits A Technique for Exposing Individual Flies on (H C M Parr and L E H Grose), 475
Insecticidal Potency Effects of 2-Diethylaminoethyl 2,2-Diphenylpentanoate (SKF 525A) on (P S Hewlett, C J Lloyd and Angela N Bates), 1273
Insecticide and Fungicide Conference British (Association of British Manufacturers of Agricultural Chemicals), 406, 1140
Insecticides Effect of Age and Pregnancy on the Tolerance of Tsetse Flies to (G F Burnett), 188

INDEX

I

Insecticides (Chlorinated Hydrocarbon) Effect of, on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase (Jennifer Rothschild and Dr G F Howden), 283
Insects Polymorphism in (Royal Entomological Society Symposium on), 412
Insects as Social Animals, 801
Insects (Social), International Union for the Study of Fourth Congress, 801
Inspiration of Science (Sir George Thomson), 696
Institute Medal of the Textile Institute awarded to K W L Kenchington, 406
Instrument Technology, Society of First Thomson Lecture, The Inspiration of Science (Sir George Thomson), 696
Instrument Technology, Society of, and the Royal Dutch Institute of Engineers Joint Conference on Measurement and Control Technology, 1241
Instrumentation Analytical, *review* by Dr D T Lewis, 391
Instrumentation Conference Proceedings of the Sixth Tripartite (Chalk River, Ontario, 1959), Part I, Reactor Instruments , Part 2, Radiation Dosimetry , Part 3, System and Component Reliability , Part 4, Instruments for Nuclear Physics , Part 5, Radiation Detectors, 802
Instruments and Methods (Nuclear) Vol 11, No 1, Proceedings of the Second Accelerator Conference, Amsterdam, 1960 (edited by Prof K Siegbahn), 123
Insulin Effect of, on Pathways of Glucose Oxidation in the Rat Lens (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075
  Effect of, on the Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extracellular Glucose (P Volfin, D Eboue and H Clauser), 166
  A Precipitating Antibody to (Valerie E Jones and Prof A C Cunliffe), 136
Intact and Hypertensive Rats Effect of Monovalent Cations on the Blood Pressure of (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Intact and Hypophysectomized Rats Effect of Sheep Pituitary Extract on Hypercholesterolaemia in (Dr Russel M Barakat), 71
Intake (Dry-Matter), of Grazing Sheep A New Method of Estimating the, from their Faecal Output (J B Owen), 92
Integers from 1000 to 9999 Reciprocals of the, with an Appendix on Mechanical Barrel-setting Calculators (T H Redding), *review* by Prof T A A Broadbent, 856
Intensity Distribution of, among various Ultrasonic Diffraction Orders (Dr C Raghupathi Rao), 220
Intensity of Driving Stimulus Effects of, on the Shape of Membrane Action Potential of the Heart (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Intensity (Neutron), of Cosmic Rays World-wide Distribution of Diurnal Variation of the (Tsunekichi Kanno), 250
Interaction of ^{14}C-Œstrone with Tryptophan in the Presence of Peroxidase (Dr P H Jellinck and Louise Irwin), 660
Interaction of the Carcinogenic *N*-Methyl-Nitrosourethane with Sulphydryl Groups (Dr R Schoental), 670
Interaction of Light and Atmospheric Photochemical Products ('Smog') within Plants (O C Taylor, W M Dugger, jun , E A Cardiff and E F Darley), 814
Interaction between Lysozyme and a Phospholipid of Neoplastic Tissue (Oncolipin), (R Ferrari and S Matracia), 1187
Interaction of West Ford Needles with Earth's Magnetosphere (Prof S F. Singer), 303
Interaction of West Ford Needles with the Earth's Magnetosphere and their Life-time (Prof S F Singer), 1061
Interaction Products of Adenine and Adenosine Phosphates with Formaldehyde Demonstration of (Dr D L Woodhouse), 336
Interactions (Side-Chain), in Poly-L-Tryptophan Examination of (Sidney Shifrin), 751
Interference Television Microscope A Flying-Spot (Television Microscopy), (Dr P O'B Montgomery and L L Hundley), 1059
Intergovernmental Oceanographic Commission (Ronald I Currie), 1015
Intermediate (Possible), in Oxidative Phosphorylation Detection of a (Dr C H Suelter, M DeLuca, Dr J B Peter and Prof P D Boyer), 43
International Association for the Exchange of Students for Technical Experience Fourteenth Annual Report, 1130
International Association for the Exchange of Students for Technical Experience (United Kingdom) Report for 1960-61, 1131
International Astronautical Congress Twelfth (Dr W F Hilton), 1244
International Atomic Energy Agency Election of Oscar A Quihillalt as president, 21
  Appointment of Dr Sigvard Eklund as director-general, 115
  Conference on New Techniques in Biology and Medicine, 609
International Atomic Energy Agency, and others International Seminar for Research and Education in Physics, 709
International Conference on Coal Science Fourth (Dr I G C Dryden), 116
International Conference on High Energy Physics Proceedings of the 1960 Annual (Rochester, 1960), (edited by E C G Sudarshan, J H Tinlot and A C Melissinos), *review* by Dr G H Stafford, 7
International Conference on Magnetic and Electric Resonance and Relaxation (Netherlands Physical Society and the *Groupement Ampere*), 213
International Conference on the Metallurgy of Beryllium (Nuclear Energy Committee of the Institute of Metals), 1137
International Conference on Nuclear Physics Rutherford Jubilee (Dr A Herzenberg) 794
International Conference on Nuclear Structure Proceedings of the (Kingston, Canada, 1960), edited by D A Bromley and E W Vogt, *review* by D L Allan, 203
International (1962) Conference on Precision Electromagnetic Measurements (United States National Bureau of Standards), 922
International Congress of Anatomists Proceedings of the Symposium held during the Seventh (New York, 1960)—The Structure of the Eye (edited by George K Smelser), *review* by Dr E N Willmer 295
International Congress of Biochemistry Fifth (U S S R Biochemical Society), 1115
International Congress for Electron Microscopy Fifth, 611
International Congress of Neuro-Psychopharmacology Proceedings of the First, Rome, 1958 (edited by P B Bradley, P Deniker and C Radouco-Thomas), *review* by Prof W Ross Ashby, 392
International Co-operation in Pure and Applied Science (Seventh Pugwash Conference on Science and World Affairs), 1232
International Council of Scientific Unions Ninth Assembly (Dr H W Thompson), 703
International Dictionary of Physics and Electronics, second edition, *review* by J R Tillman, 1111
International Geophysical Year Some Ionospheric Results obtained during the—Proceedings of a Symposium organized by the U R S I /A G I Committee, at Brussels, 1959 (edited by W J G Beynon), *review* by A F Wilkins, 840
  Ionospheric Research during the, *review* by A F Wilkins, 840
International Geophysical Year Antarctic Expedition (The Royal Society), Halley Bay, Coats Land, Falkland Islands Dependencies, 1955-1959 (General Editor, Sir David Brunt), Vol I, Introductions, Aurora and Airglow, Geomagnetism, *review* by Dr R Stoneley, 1004
International Labour Organization (World Health Organization Regional Office for Europe (United Nations), and the) Conference on Health Services in Small Factories, 618
International Nickel Company of Canada, Ltd Grant of 75,000 dollars to the Royal Ontario Museum, for a new Mineral and Gem Gallery, 607
International Scientific Film Association Fifteenth Congress (M Goldsmith), 512
  Election of Officers, 514
International Seminar for Research and Education in Physics (International Atomic Energy Agency, Unesco and the Central Committee for Swedish Technical Assistance), 709
International Society of Soil Science Joint Meeting of Commission IV (Soil Fertility) and Commission V (Pedology) at Massey Agricultural College, New Zealand, 922
International Society for Stereology, 115
International Symposium on Continuous Culture of Micro-organisms Second (Czechoslovak Academy of Science), 213
International Symposium on the Growth and Development of the Lower Archegoniate Plants (Linnean Society of London), 710
International Symposium on Microchemical Techniques (Metropolitan Microchemical Society of the United States), 410
International Time Signal Changes in Times of (Royal Greenwich Observatory), 1023
International Union of Forest Research Organizations Thirteenth Congress (F C Ford-Robertson), 614
  Election of Officers, 615
International Union of Leather Chemists Societies Seventh Biennial Conference, 612
International Union for the Study of Social Insects Fourth Congress, 801
International Zoo Year Book (edited by Dr Desmond Morris and Caroline Jarvis), Vol I, 1959, *review* by G S Mottershead, 1111
Interplanetary Communication (Interstellar and), by Optical Masers (Dr Peter van de Kamp), 348 , (Prof Charles H Townes and Dr Robert N Schwartz), 348
Interplanetary Dust near the Earth (Prof S F Singer), 321
Interplanetary Dust Particles in the Vicinity of Earth Direct Measurement of (C W McCracken, W M Alexander and M Dubin), 441
Interpretation of Geophysical Surveys (Royal Astronomical Society and the Geological Society Geophysical Discussion on), 1242
Interrelationship between Fat and Sugar Metabolism in Infant Rats (P Hahn, O Koldovsky, V Melichar and M Novák), 1296
Intersections (Slip Band) Lattice Rotation at (Dr A S Argon and Prof E Orowan), 447
Interspecific Jute Hybrid Skewed Recombination in a Rare (Dr M S Swaminathan and R D Iyer), 893
Interstellar and Interplanetary Communication by Optical Masers (Dr Peter van de Kamp), 348 , (Prof Charles H Townes and Dr Robert N Schwartz) 348
Intestinal Carcinoma of the Newt Two Types of Ribonucleoprotein in the Nucleolus of, following Injection of Herring-sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Interstitial Cell Stimulating Hormone (Sheep) Complement-fixing Antibodies to Human Growth Hormone and (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Intervertebral Disk (Human) Polysaccharide Content of the Prolapsed Nucleus Pulposus of the (Dr F Happey, Dr A Wiseman and A Naylor), 868
Intestinal Proteinases in an Insect, *Calliphora vomitoria* L (Dr Alastair Fraser, Richard A Ring and Robin K Stewart), 999
Intestine Alterations in Connective Tissue and, produced by Hypervitaminosis A in *Xenopus laevis* (Gerald Weissmann), 235
Intestine (Small), of Conventional and Germ-free Chicks Serotonin in the (Prof A W Phillips, H R Newcomb, J E Smith and R Lachapelle), 380
Intestine (Small), of Vertebrates Comparison of the Mitochondria of the (P J Stanbury), 67
Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin on Glucose Uptake and (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Intracellular Response to an Iso-immune Reaction at the Surface of Ascites Tumour Cells (D C Dumonde, Clarice M Walter, Lucille Bitensky, Prof G J Cunningham and J Chayen), 1302
Intracellular *Rickettsia*-like Micro-organisms in certain Ticks (M A Roshdy), 186
Intracellular Stages (Extra- and), of Gregarine and Coccidian Protozoa Periodic Acid–Schiff Technique for the Demonstration of (Dr J B Jennings), 473
Intramolecular Hydrogen Bonding Participation of Imidazole in (Prof A Lukton), 422
Intra-Pericardial Hepatic Intrusion in the Common Dogfish (Dr A S Fuller), 280
Intraventricular Bretylium Antagonism of Reserpine by (Stata Norton and Kenneth I Colville) 72
Intraventricularly Injected Anti-N Caudatus Antibody Effects of on the Electrical Activity of the Cat Brain (Dr Lj Mihailović and Dr B D Janković) 665
Introduction a l'Électrodynamique Quantique (Prof Daniel Kastler) *review* by Dr P Roman 1111
Introduction to the Organic Chemistry of High Polymers (Prof Carl S Marvel), *review* by Dr I C McNeill, 591

Introduction to Parasitology, with special reference to the Parasites of Man (the late Prof Asa C Chandler and Prof Clark P Read), tenth edition, *review* by Dr G Lapage, 488
Introduction to Quantum Mechanics (Prof Robert H Dicke and Dr James P Wittke), *review* by S F Edwards, 1005
Introduction to a Submolecular Biology (Prof Albert Szent-Gyorgyi), *review* by Prof D D Eley, 853
Introduction to the Theory of Numbers (Prof Ivan Niven and Prof Herbert S Zuckerman), *review*, 856
Introduction (A Chemist's), to Statistics, Theory of Error and Design of Experiment (Dr D A Pantony), 213
Intrusion (An Intra-Pericardial Hepatic), in the Common Dogfish (Dr A S Fuller), 280
Invar Range of Compositions A New Reversible Solid-State Transformation in Iron–Nickel Alloys in the (Prof N I Ananthanarayanan and R J Peavley), 962
Inventory of Abstracting Services (Federation Internationale de Documentation), 1026
Invertebrates (Marine) Changes in Adenine Nucleotides in the Muscles of some (Kenichi Arai and Tsuneyuki Saito), 451
Investigation with the Electron Microscope of the Sublimation of Ice Crystals at Low Temperatures (Prof Tokio Nei), 1177
Investigation (Structural), of a Laminaran isolated from *Eisenia bicyclis* (Nobuhiko Handa and Prof Kazutosi Nisizawa), 1078
Involvement (Particle), in Fatty Acid Synthesis in Liver and Yeast Systems (S Abraham, I L Chaikoff, W M Bortz, H P Klein and Halina Den), 1287
Iodide (Silver) Surface Properties of (Prof A C Zettlemoyer, Noubar Tcheuredkjian and J J Chessick), 653
Iodine-131 Permeability of the Mammary Gland to Sodium-24, Potassium-42, Chlorine-36 and (P -G Knutsson), 977
Iodine-131 in Milk in Britain (Agricultural Research Council), 504 707
Iodine Number (Depot Fat), in Children Ambient Temperature and (I Macdonald), 363
Iodo *Bis* (2-2′-Bipyridyl) Copper(II) Ion The Trigonal-Bipyramidal Configuration of the (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard), 425
Iodoacetic Acid Effects of, on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays (Dr M Quintiliani, M Boccacci and L Tentori), 573
Ion (Iodo *Bis* (2-2′Bipyridyl)Copper(II)) The Trigonal-Bipyrimidal Configuration of the (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard), 425
Ion Binding (Paramagnetic), in Deoxyribonucleic Acid Solutions Relaxation Enhancement by (J Eisinger, R G Shulman and W E Blumberg), 963
Ion-Exchange Chromatography Determination of Argininosuccinic Acid by (D C Cusworth and R G Westall), 555
  Effect of Charcoal on the Behaviour of Adenine Nucleotides in (U Pethiyagoda), 452
Ionic-Covalent Bonding in Crystals (C H L Goodman) 355 , (E Mooser and W B Pearson) 355
Ionic Melts (Faraday Society Discussion on), 509
Ionization Detection by, of Gases in Helium used in Gas Chromatography (W A Wiseman), 964
Ionization Chambers (Cavity) Measurement of Stopping-Power Ratio for (T E Burlin), 545
Ionizing (Auto-) Transitions in Krypton Experimental Detection of by Electron Impact (John F Burns), 651
Ionosphere Possible Solar Flare Effects in the F Region of the (Dr G H Munro) 347 (Dr R W Knecht and Dr K Davies), 348
Ionosphere at Sodankyla Round-the-World Sound Waves produced by the Nuclear Explosion on October 30, 1961, and their Effect on the (G Rose, J Oksman and E Kataja), 1173
Ionospheric Research during the International Geophysical Year, *review* by A F Wilkins, 840
Ionospheric Results obtained during the International Geophysical Year Some—Proceedings of a Symposium organized by the U R S I /A G I Committee, at Brussels, 1959 (edited by W J G Beynon), *review* by A F Wilkins, 840
Ions (Chromic) in the Corundum Lattice Ligand Field for (Dr J Graham and Dr D E Scaife), 161
Ions (High-Energy Hydrogen) Emission of Ultra-Violet and Visible Radiation from Metals by the Impact of (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan) 646
Ip, M C , and others Muscle Receptors (Structure, Nerve Spectra and Distribution of Spindles in Cat Muscles), 806
Iran, Pakistan and Turkey Role of Science in the Development of Natural Resources with particular reference to (Scientific Council of the Central Treaty Organization Symposium on), 609
Ireland A Spartinetum at Baldoyle in (Patricia J Boyle and James A Kavanagh) 81
Iris pseudacorus L Cytochrome c Oxidase, the Terminal Oxidase of (G G Henshaw, D A Coult and D Boulter), 579
Iron Absorption (Increased) without Increase in the Rate of Erythropoiesis (Dr Gerald A Mendel), 878
Iron Chelator Production of Chromatid Aberrations by Diepoxybutane and an (Prof Norman S Cohn), 1093
Iron-Transport Proteins in Serum Presence of Two (Dr M Faber and R Jordal), 181
Iron-59 in Incubated Rat Red Cells *in vitro* Effect of Hydrocortisone on Uptake of (Peggy Clark) 667
Iron (Plasma) and Iron-binding Capacity in the Pregnant Rat and Rabbit (E H Morgan), 461
Iron-binding Capacity in the Pregnant Rat and Rabbit Plasma Iron and (E H Morgan), 461
Iron–Nickel Alloys A New Reversible Solid-State Transformation in, in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavley) 962
Irradiated (Neutron-) Ammonium Sulphate Behaviour of on Thermal Annealing (Dr Nikola Getoff and Masaru Nishikawa) 61
Irradiation Effects of on the Incorporation of Amino-Acid into Normal and Regenerating Rat Liver (Dr Nirmal K Sarkar Dr Anima Devi and Dr Louis H Hempelmann) 179
Irradiation of Methane with 4-MeV Electrons Production of High Molecular Weight Products from the (R. W Hummel), 1178
Irradiation with Ultra-Violet Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after (T Hudnik-Plevnik and Dr L A Stocken), 554
Irradiation (Ultra-Violet) Detecting Reversion in *T4rII* Bacteriophage to r^+ induced by (Prof C E Folsome and D Levin), 1306
Irradiation (Whole-Body), and Cortisone Effect of on the Development of *Ostertagia* spp in Sheep (J D Dunsmore), 139
Irvine, Dr R F Woody Plants of Ghana with special reference to their Uses, *review* by W D Clayton, 695
Irwin, Louise (Jellinck Dr P H , and) Interaction of ^{14}C-Œstrone with Tryptophan in the Presence of Peroxidase, 660
Irwin, Raymond, and Staveley, Ronald (edited by) The Libraries of London, second edition, *review* by R Brightman, 592
Irwin, Dr Richard L , and others Acetylcholine in Sweat in Fibrocystic Disease of the Pancreas, 77
Isaacs, Dr Alick Chemotherapy of Virus Diseases, 806
  Mechanisms of Virus Infections (Interference Phenomena), 1247

Mach Tables for Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with Total Temperatures to 10,000° K (K L Goin) 308
Mach's Principle Dirac's Cosmology and (Prof R H Dicke), 440 , (Prof P A M Dirac), 441
Machine A Novel Electrostatic—the Corona Motor (J D N Van Wyk and G J Kuhn), 649
Machines Teaching (British Association for the Advancement of Science, Section J (Psychology), Symposium on) 105
Machines (Computing) Universal Language for (Dr A D Booth), 22
Machova M (Zahoř, Z , and) Dissecting Aneurisms of the Large Arteries of Chick Embryos due to (Sweet Pea) Lathyrism, 532
McIntosh, Dr A B , and Heal, T J (edited by) Materials for Nuclear Engineers, *review*, 392
McIntosh Dr D S (Elworthy, Dr P H , and) Phospholipids and Sulpholipids (Light Scattering of Lecithin), 808
McIntyre, Prof A K (read by) Muscle Receptors (Central Connections of Muscle Afferent Fibres), (paper by Sir John Eccles), 805
Mackay, Prof D M At the Sixth Annual Conference of the British Society for the Philosophy of Science (Learning Machines), 508
  Visual Effects of Non-Redundant Stimulation 739
McKee Douglas W Catalytic Decomposition of Ethylene on Nickel, 654
McKee, Dr J S McKinley (Theorell, Prof Hugo, and) Mechanism of Action of Liver Alcohol Dehydrogenase, 47 , *erratum*, 710

McKenna, Dr J M, and Sanderson, R P Effect of Phagocytosis on the Lysis of *Staphylococcus aureus* (Type 81) by Bacteriophage, 570
McKennell, Dr R Rotation Viscometers and their Application to Non-Newtonian Measurements, 308
McKenzie-Taylor, Dr E *Obituary* by H H Nicholson, 706
Mackenzie River Delta Effect of a Lake on Distribution of Permafrost in the (G H Johnston and R J E Brown) 251
McKie, Prof D Chemistry in the Service of Medicine, 1600-1800, 1017
Mackie, J C, and Lyons, Dr L E At the Third Australian Spectroscopy Conference (Theoretical Methods which enable the Accurate Calculation of the Ionization Potential of a Molecular Crystal from a knowledge of the Ionization Potential of the Free Molecule, its Polarizability and the Crystal Structure), 927
Mackie, Prof J L At the Sixth Annual Conference of the British Society for the Philosophy of Science (Philosophical Aspects of Cosmology), 509
Macku, G, and others Systematic Measurement of Fall-out in Czechoslovakia up to 1961, 398
McLachlan, A D Spectroscopic Studies using Time-Resolved Techniques, 1034
McLaren, Prof A D, and Peterson, G H Montmorillonite as a Caliper for the Size of Protein Molecules, 960
McLaren, Dr D S, and Read, W W C An Unusual Major Fatty Acid Component in Human Depot Fat, 265
McLauchlan, K A and others Structures and Conformations of some Naturally Occurring Derivatives of Proline, 1150
McLennan, H, and others Inhibitory Properties of the Catecholamines, 563
MacLeod, Prof Robert A, and Matula, Tibor Solute Requirements for Preventing Lysis of some Marine Bacteria, 1209
McManus, W R Mixed Saliva from Sheep, 1161
McMichael (Leslie) Premium of the British Institution of Radio Engineers awarded to C H Dix and W E Wilshaw, 609
MacNalty, Sir Arthur Salusbury (edited by) The British Medical Dictionary, *review* by Dr K M Hawkins, 849
McNaught, K J, and others Effect of Copper Deficiency in White Clover on Nitrogen Fixation 1315
McNeill, Dr D B (Jerrard, Dr H G, and) Theoretical and Experimental Physics, *review* by D H Trevena, 491
McNeill Dr I C Polymer Chemistry, *review*, 490
  Polymer Chemistry, *review*, 591
  Appointed to a lectureship in chemistry in the University of Glasgow, 1132
McNeill, J J At the Third Australian Spectroscopy Conference (Design of an Inexpensive General-purpose Monochromator for use above 2000 Å), 928
McQuillan, Dr Mary T, and others Proteolysis of Thyroglobulin by Thyroid Enzymes 333
MacRae, D G Appointed to the chair of sociology in the London School of Economics and Political Science 922
McRae, Dr E G At the Third Australian Spectroscopy Conference (Theoretical Relationship between Fluorescence and Vibrational Structure and Davydov Splitting in Molecular Crystals), 927
Macrae, Dr T F Chemistry in the Service of Medicine (Chemistry and Nutrition), 1018
Macromolecular Synthesis Cytodifferentiation and (Society for the Study of Development and Growth Symposium on), 802
Macromolecules A Cell for Rapidly Measuring Restriction to Diffusion of, through Agar Gels of various Pore Sizes (G K Ackers and R L Steere), 436
McWilliams, J A (Watt, D A, and) Thermionic Generation of Electricity (Two Engineering Design Studies of Experimental In-pile Thermionic Generators), 612
Madden, Dr R P Appointed to the Atomic Physics Division of the United States National Bureau of Standards, 507
Madel, Dr W At the First British Insecticide and Fungicide Conference (Soil Sterilants), 1141
Madow, William G, and others (edited by) Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling, *review* by Dr. D E Barton, 846
Maehly, Dr A C Haemin–Protein Binding in Peroxidase and Methaemalbumin, 630
Mager, Dr J, and others Cytotoxic Effect of Aminoacetonitrile on Fibroblast Cultures and its Prevention by Histidine, 170
Magnesite–Dolomite Sediments in South Australia Occurrence of (Prof A R Alderman and C C von der Borch), 861
MgCl Rotational Analysis of the $A^2\Pi–X^2\Sigma^+$ System of (E Morgan and Dr R F Barrow), 1182
Magnesium Oxide ('Active') Production of, by Heating in Vacuum (R Valverde and J P Saenz), 653
Magnetic Fields Advances in the Generation and Use of Very High, Continuous (Dr Henry H Kolm), 299
  A New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Magnetic Resonance Spectroscopy (Nuclear), of Proteins—The Hydrogen Bonding of Water in Bovine Serum Albumin Solutions (F A Bovey), 324
Magnetic and Electric Resonance and Relaxation (Netherlands Physical Society and the *Groupement Ampere* International Conference on), 213
Magnetically Quiet and Disturbed Days Diurnal Variation of High-Altitude Auroral Frequency on (Knut Lassen), 345
Magnetization (Differential Secondary), in some British Cambrian Rocks (D E T Bidgood), 39
Magnetization Variation (Spin), in a Two-level Maser Oscillator Detection of (I M Firth and Dr D Bijl), 860
Magneto-Optical Effect (Faraday) A New Application of the, for Diagnostic Measurements of Transient Magnetic Fields (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Magnetosphere (Earth's) Interaction of West Ford Needles with (Prof S F Singer), 303
  Interaction of West Ford Needles with the, and their Life-time (Prof S F Singer), 1061
Magnusson, Dr E A, and Shull, Dr H At the Third Australian Spectroscopy Conference (Barrier to Internal Rotation about a Single Bond), 928
Mahadevan, V, and others Feeding of Bamboo Flowers to Laboratory Rats and Mice, 470
Mahé (Island of), in the Seychelles Archipelago Potassium–Argon Age Determinations on Granite from the (J A Miller and J D Mudie), 1174
Maheshwari, P, and Vasil, Vimla Gnetum, *review* by Dr C R Metcalfe 1006
Mahta, D N, and others Cotton in India, Vol 3, *review* by Prof S C Harland 200
Mair, J W Appointed Research Fellow in the Department of Materials, College of Aeronautics Cranfield, 406
Maitland, B J G Observations and Experiments in Natural History, *review*, 851
Maize Plants infected by Maize Rough Dwarf Virus Accumulation of Asparagine in and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
Maize Rough Dwarf Virus Accumulation of Asparagine in Maize Plants infected by, and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
Majer, Dr J R, and Patrick, Dr C R Heat of Formation of the Difluoromethylene Radical, 866
Major Fatty Acid Component (An Unusual), in Human Depot Fat (Dr D S McLaren and W W C Read) 265
Major Ideas in the Physical Sciences from the Earliest Times to the Present The Search for Order—the Development of the (Cecil J Schneer), *review* by Prof Herbert Dingle 901
Majumdar, Dr R C History of Sciences in Ancient and Medieval India (Social and International Relations in the Development of Science), 27
Majumder, S K, and others Pre-Harvest Prophylaxis for Infestation Control in Stored Food-Grains, 375
Makino, Prof Katashi (Matsuda, Makoto, and) D-Penicillamine as an Antidote to 8-Hydroxyquinoline and Alloxan, 261
Malaria (Human) Gamma-Globulin and Acquired Immunity to (Dr S Cohen, Dr I A McGregor and S Carrington), 733
Malathion in Rats Second-Generation Toxicity of (Prof W Kalow and A Marton), 464
Malawista, Ina, and Davidson, Prof E A Isolation and Identification of Rhamnose from Rabbit Skin, 871
Malayan Nature Society Special issue of the *Malayan Nature Journal*, Nature Conservation in Western Malaysia (edited by J Wyatt-Smith and P B Wycherley), 801
Malaysia (Western) Nature Conservation in (edited by J Wyatt-Smith and P B Wycherley), 801
Malcolm, Group-Capt J E Oscillatory Flow in an Air-filled Elastic System, 875
Male Lugworm Spawning Mechanism in the (Dr D I D Howie), 1100
Male Rat Growth Hormone Activity of the Anterior Pituitary Lobe of the, at various Ages (R H Bowman), 976
Males (Radioactive) Inhibited Oviposition of Females of *Gryllus assimilis* (F), induced by, using L-Methionine-Methyl-^{14}C (Dr A A Abdel-Malek and D K McE Kevan) 681
Malic Enzyme in *Lactobacillus arabinosus* (17-5) Nutritional Requirements for the Induced Formation of (Sheila M Bocks), 89
Malignant Tumours Apparent Induction of, by Organ-Specific Antiserum (Prof H N Green), 1201
Maling, Dr D H, and others The Falkland Islands, *review* by Dr R J Adie, 853
Malissa, H, and Pell, E Microchemical Techniques (Complete Automation of the Micro-determination of Carbon, Hydrogen and Sulphur), 411
Maloney, J E At the Third Australian Spectroscopy Conference (Problems of Instrumentation in the Development of the full Potentials of X-ray Fluorescence Spectroscopy as an Analytical Tool), 928
Mammalian Fauna from the Kimmeridgian of Portugal (Dr Walter G Kuhne), 274
Mammary Carcinoma Cells (Mouse) Nucleolar Succinic Dehydrogenase in (P De, R Chatterjee and Dr S Mitra), 285
Mammary Gland Permeability of the, to Sodium-24, Potassium-42, Chlorine-36 and Iodine-131 (P-G Knutsson), 977
Mammi, Dr M, and others Crystal Structure of 2,5-Dimethyl-Dithio-Furophthene, a Homologue of Thio-Thiophthene 1282
Man Animal Parasites in (Dr N H Swellengrebel and M M Sterman), *review* by Dr G Lapage, 197
  Introduction to Parasitology, with special reference to the Parasites of (the late Prof Asa C Chandler and Prof Clark P Read), tenth edition, *review* by Dr G Lapage, 488
  Parasites of, *review* by Dr G Lapage, 488
  Quantitative Sub-Groups of the *B* Antigen in, and their Occurrence in Three Racial Groups (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
  The Systematics of (Dr B G Campbell), 710
Man (Early) Possible Origin of the Use of Fire by (D C Arnold), 1318
Man-power (Scientific), in Britain 293
Man-power (Scientific) The Long-Term Demand for (Statistics Committee of the Advisory Council on Scientific Manpower Survey on), 293
Man-power (Technical and Scientific), in Britain, 1105
Management, British Institute of (South London Branch) Conference on the Preparation and Use of Case Studies 21
Management (Personnel), Institute of Personnel Management Salaries—Report of a Survey undertaken in February–March 1961, 506
  Annual Report for 1960-61 1024
Management (Personnel) Salaries—Report of a Survey undertaken in February–March 1961 (Institute of Personnel Management) 506
Management and Techniques Laboratory (J A Edwards), *review* by E I Johnson, 854
Manchester College of Science and Technology Summer School in Analytical Chemistry (organized by the Royal Institute of Chemistry), 608
  Course of Lectures in the Department of Municipal Engineering on Problems of Radioactivity at Water and Sewage Works, 609
  Annual Report for 1960-61 922
Mandel, Prof P, and others Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the Central Nervous System of the Rat, 456
α-Manganese Phases containing Technetium-99 (D J Lam, J B Darby, jun, J W Downey and L J Norton), 744
Mangani-Versene and by Wheat Leaf Enzyme Oxidative Decarboxylation of Indole-3-acetic Acid by (Prof R A Abramovitch and K S Ahmed), 259

Mangold H K, and co-workers Microchemical Techniques (Thin-layer Chromatography acts as a valuable Analytical and Preparative Tool in Lipid Chemistry), 412
Mani pintar Groundnut Variety (J McEwen), 92
Mankind Quarterly, Vol 1, No 4, and Vol 2, No 1, 20
Manley, Prof G Effects of Climate on Vegetation, *review*, 5
Manley, Dr G H Appointed by the Zoological Society of London to a Research Fellowship (at St Mary's Hospital Medical School) on the reproductive behaviour of the lower primates, 211
Manly, T D Oxidation Processes in Chemical Manufacture (Industrially Important Chemical Processes using Hydrogen Peroxide), 1135
Mann, H (Schmid, O J, and) Action of a Detergent (Dodecylbenzenesulphonate) on the Gills of the Trout, 675
Mann, Henry B, and others (edited by) Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling, *review* by Dr D E Barton, 846
Mannella, G G Formation of Active Nitrogen using Sources of Alternating Current and Direct Current, 159
Manner of Expressing Rate of Ribonucleic Acid Biosynthesis (D G Fraenkel and F C Neidhardt), 677
Mannitol, Laminarin and Fucoidin (Alginic Acid,), in the Brown Alga, *Ecklonia radiata* Seasonal Variation in (C M Stewart, H G Higgins and Sue Austin), 1208
Mannosyl D-Glucosamine Hydrochloride Isomers—6-O-Mannosyl D-Glucosamine Hydrochloride (Dr S A Barker, Dr K Murray, Prof M Stacey and Dr D B E Stroud), (143, July 8, 1961), *erratum*, 710
Mansberg, H P (Tolles, W E, and) Scanning Techniques in Biological and Medical Microscopy (The 'Cytoanalyser for the Mass Screening of Cervical and Vaginal Smears, to aid in the Early Diagnosis of Cancer), 1031
Manten, A, and Wisse M J Antagonism between Antibacterial Drugs, 671
Manufacture (Chemical) Oxidation Processes in (Society of Chemical Industry Symposium on), 1134
Manufacture (Electrolytic), of Chemicals from Salt (Dr D W F Hardie), *review* by Dr M J Newlands, 902
Manufacturers (British), of Agricultural Chemicals, Association of First British Insecticide and Fungicide Conference, 406, 1140
Marasas, L W Formation of Histamine and Histamine-like Substances from Histidines by Quartz Dust, 872
Marble (Syenite–) Contact Formation of Pegmatitic Carbonatite in a (R D Schuiling), 1280
Mardell, R, and others Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the Central Nervous System of the Rat, 456
Maresh, C, and co-workers Microchemical Techniques (Combustion Analysis for Carbon, Hydrogen and Sulphur), 411
Margoliash, Dr E, and Smith, Prof Emil L Amino-Acid Sequence of Horse Heart Cytochrome *c*—Peptides released by Digestion with Chymotrypsin, 1121
Margoliash, Dr E, and others Amino-Acid Sequence of Horse Heart Cytochrome *c*—The Complete Amino-Acid Sequence, 1125
Marine Bacteria Solute Requirements for Preventing Lysis of some (Prof Robert A MacLeod and Tibor Matula), 1209
  Spheroplasts of, Induced by the Action of Penicillin (J R Boring and Prof D Pratt), 773
Marine Diatom Penetration of Spines from a, into the Gill Tissue of Lingcod (*Ophiodon elongatus*), (Dr Gordon R Bell), 279
Marine Engineering (Denny Scholarship in, 1961) awarded by the Royal Institution of Naval Architects to David K Brown, 309
Marine Engineering (Parsons Scholarship in, 1961) awarded by the Royal Institution of Naval Architects to Alan B Turner, 309
Marine Invertebrates Changes in Adenine Nucleotides in the Muscles of some (Ken-ichi Arai and Tsuneyuki Saito), 451
Marine Organisms Oil Pollution of (Dr M George), 1209
Marine Populations in Icelandic Waters Fluctuations in (G Bodvarsson and J Jonsson), 768
Markers (Linked), in *Bacillus subtilis* Comparison of Transduction versus Transformation of (Erela Ephrati-Elizur and Maurice S Fox), 433
Market (The Common), and the United Kingdom (Westminster Bank, Ltd) 801
Markham, Dr R Promoted to Deputy Chief Scientific Officer, 215, work of, 215
Markley, K S (edited by) Fatty Acids, Part 1, second edition, *review* by Dr Geoffrey Eglinton, 199
Marks J (Bradley, Dr J E S, and) Method of Measuring the Mossbauer Effect, 1176
Marmet, Dr P At the Third Australian Spectroscopy Conference (Producing Mono-energetic Electrons in a Mass-Spectrometer), 927
Marmur, J Structure, Synthesis and Function of Deoxyribonucleic Acid (Chemical Sequence and Heterogeneity), 24
Marrow (Homologous Bone), or Spleen Cells Transfer of Immediate (Anaphylàctic) Hypersensitivity by (Dr V Stankovic and S Vlahović), 762
Marrow (Human Bone), treated with Human Deoxyribonucleic Acid Formation of Different Haemoglobins in Tissue Culture of (Prof Lorraine M Kraus), 1055
Marrow Stem and Thousand-headed Kale Potential Productivity of (Dr L G G Warne), 579
Marrow (Bone-) Cells from the Cadaver Persistence of Motility in (Dr I B Porteous), 569
Marsden, Sir Ernest At the Rutherford Jubilee International Conference on Nuclear Physics, 794
Marshak, R R, and others Natural Occurrence of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the Eastern Raccoon, 1312
Marshes (Salt), and Salt Deserts of the World (Prof V J Chapman), *review* by Prof W T Williams, 833
Marson, F (Rischbieth, J R, and) A Coating with Antifouling Properties from the Reaction between Cuprous Oxide and Sodium Silicate, 748
Martelli, G Appointed lecturer in physics at the University of Birmingham, 406
Martin, Dr A E Gravitational and Electrostatic Forces, 59
Martin, A J Metallurgy of Beryllium, 1138
Martin, Dr A R (Clarkson, Dr R, and) 4-Sulphanilamido-6-Methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,536)—Two New Long-acting Sulphonamides, 523
Martin A T At the Third Australian Spectroscopy Conference (Reflectance of Opaque Materials as a function of Pigment Concentration), 928
Martin, Dr Hubert At the First British Insecticide and Fungicide Conference (Effects of Chlorinated Hydrocarbons and other Chemicals on the Ecology of the Soil Fauna and Flora), 1140
Martin, J C Promoted to Senior Principal Scientific Officer, 215, work of, 215
Martin, L H and others Stanford–Pacific Naval Laboratory Conjugate Point Experiment, 319
Marton A (Kalow, Prof W, and) Second-Generation Toxicity of Malathion in Rats, 464
Marvel, Prof Carl S An Introduction to the Organic Chemistry of High Polymers, *review* by Dr I C McNeill, 591
Maser Oscillator (Two-level) Detection of Spin Magnetization Variation in a (I M Firth and Dr D Bijl), 860
Maser Theory, *review* by Dr J H Sanders, 202
  Elements of (Arthur A Vuylsteke), *review* by Dr J H Sanders, 202
Masers (Optical) Interstellar and Interplanetary Communication by (Dr Peter van de Kamp), 348, (Dr Charles H Townes and Dr Robert N Schwartz), 348
Masers (Optical Ruby) Mode Characteristics and Coherence in (Dr I D Abella and Dr C H Townes), 957
Maslen, Dr E N, and others X-Ray and Neutron Diffraction Examination of *p*-Diphenylbenzene, 154
Mason, Dr R (Chalvet, Dr O, and) Carcinogenicity of the Methyl-1,2-Benzanthracenes and their Derivatives, 1070
Mason, S N, and others Products of the γ-Radiolysis of Aqueous Cystine Solutions, 352
Mass (Lunar) Exact Determination of the, by means of Selenoid Satellites (Dr E T Benedikt), 442
Mass Thickness of Biological Samples Estimation of, from their Electron Micrographs (M L De), 546
Massachusetts Institute of Technology Given a High-speed Digital Computer (a Programmed Data Processor) by the Digital Equipment Corporation, Maynard, Mass, 922
Massey Sir Harrie, and Potter, Dr A E Atmospheric Photochemistry, 213
Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*— (Dr J J Saukkonen), 816
Mast Cell Lytic Antibodies (Dr I Mota), 1201
Mast Cell Turn-over in Adult Mice (Prof Bruce E Walker), 980
Matalaque, Southern Peru Epidemiological Surveys on Chagas' Disease in the Village of (Felix Naquira, Eleazar Cordova, Cesar Naquira and Enrique Rubin de Celia), 921
Matalaque Region, Southern Peru Incidence of Chagas' Disease in the (Eleazar Cordova), 921
Materials for Nuclear Engineers (edited by Dr A B McIntosh and T J Heal), *review*, 392
Materials for Reactors, *review* by B W Mott, 100
Materials (Biologically Active), in Coal (Martin H Rogoff and Irvine Wender), 378
Mathematical Association of America Annual Meeting of the, in conjunction with the sixty-eighth Annual Meeting of the American Mathematical Society, 609, 1026
Mathematical Reprints (Chelsea Publishing Co, New York), 114
Mathematical Society (American) Sixty-eighth Annual Meeting, in conjunction with the Annual Meeting of the Mathematical Association of America, 609, 1026
Mathematical Society (Australian) Election of Officers, 114
Mathematical Tables, *review* by Prof C A Coulson, 97
Mathematical Theory of Nutritional Relationships of Fishes, *review* by L Birkett, 297
Mathematics Elementary Logic of Science and (Dr P H Nidditch), *review* by Prof R L Goodstein, 856
Mathews, J D, and others Proteolysis of Thyroglobulin by Thyroid Enzymes, 333
Mathys, H R Appointed a deputy chairman of Courtaulds, Ltd, 918
Matracia, S (Ferrari, R, and) Interaction between Lysozyme and a Phospholipid of Neoplastic Tissue (Oncolipin), 1187
Matsuda, K, and others Effects of Intensity of Driving Stimulus on the Shape of Membrane Action Potential of the Heart, 1295
Matsuda, M, and Makino, Prof Katashi D-Penicillamine as an Antidote to 8-Hydroxyquinoline and Alloxan, 261
Matsuda, M (Yoneda, Prof M, and) A Subcellular Component of *Corynebacterium diphtheriae* having the Capacity to Bind Anti-Toxin, 642
Matsui, Katsuhiko, and others Acylase Activity of Ascites Tumour Cells on Dichloroacetyl Derivatives of Amino-Acids, 468
Matter (Dry-) Intake of Grazing Sheep A New Method of Estimating the, from their Faecal Output (J B Owen), 92
Matthes, H Feeding Habit of some Central African Freshwater Fishes, 78
Matthew, Margaret, and others Biosynthesis of Porphyrins and Chlorophylls, 204
Matthews, Dr L Harrison The Better Use of the World's Fauna for Food (Problems and Potentialities of Wild-Game Ranching in Africa), 1113
Matthews, Dr P T Title of professor of theoretical physics (at the Imperial College of Science and Technology, London) conferred on, 802
Matthews, Dr R E F Quantitative Biology (Different Effects of the Uracil Analogue 2-thio-uracil), 25
Mattner, P E (Moule, G R, and) Seminal Degeneration induced in Merino Rams by the Administration of Stilboestrol Dipropionate, 364
Matula, Tibor (MacLeod, Prof Robert A, and) Solute Requirements for Preventing Lysis of some Marine Bacteria, 1209
Mature Runner Bean Seeds 'Bound' Gibberellin in (A J McComb), 575
Mature Sieve Tubes Transcellular Strands and Particle Movement in (Dr R Thaine), 772
Mavis, L, and others Radioprotective Effects of Reserpine and its *N*-oxide, 1309
Maxim, I (Braun, T, and) Radiation Effects on Lithium-doped Nickel Oxide Catalysts in Carbon Monoxide Oxidation, 548
Maxwell (Clerk) Premium of the British Institution of Radio Engineers awarded to Dr G T Wright, 609
May, Dr A N Fatigue under Random Loads, 158
May, Everette L, and others A New Potent Analgetic Antagonist, 1089
Maycock, Dr W d'A, and Ricketts, Dr C R Stability of Dextran during Prolonged Storage, 174

Mayr-Harting, Dr Anna Nature of Colicine Receptors, 191
Maze Microscopy in a, *review* by Dr R Barer, 833
Mead, Dr W R Title of professor of geography (at University College, London) conferred on, 710
Meade, Dr R H (Weinstein, Dr L, and) Absorption and Excretion of Penicillin injected into the Muscles of Patients with Diabetes Mellitus, 987
Measurement of Dipole Moment Heart Dipole Regions and the (Dr M R Barber and Dr E J Fischmann), 141
Measurement of the Stopping-Power Ratio for Cavity Ionization Chambers (T E Burlin), 545
Measurement of Water-Flow, *review* by Prof S P Hutton, 842
Measurement (Direct), of Interplanetary Dust Particles in the Vicinity of Earth (C W McCracken, W M Alexander and M Dubin), 441
Measurement (Systematic), of Fall-out in Czechoslovakia up to 1961 (Prof W Santholzer, G Macku and J Podzimek), 398
Measurement Techniques Microwave (Institution of Electrical Engineers Conference on), 408
Measurement and Control Technology (Society of Instrument Technology and the Royal Dutch Institute of Engineers Joint Conference on), 1241
Measurements Precision Electromagnetic (United States National Bureau of Standards 1962 International Conference on), 922
  Radiometric Standards and (E J Gillham), (National Physical Laboratory, Notes on Applied Science No 23), 1250
Measurements (Diagnostic), of Transient Magnetic Fields A New Application of the Faraday Magneto-Optical Effect for (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Measurements (Hydraulic) Hydrometry—Theory and Practice of (Prof Adam T Troskolanski), *review* by Prof S P Hutton, 842
Measurements (Non-Newtonian) Rotation Viscometers and their Application to (Dr R McKennell), 308
Measuring the Mossbauer Effect Method of (Dr J E S Bradley and J Marks), 1176
Measuring (Automation, Computers, Control and) Elsevier's Dictionary of, in Six Languages, English/American, French, Spanish, Italian, Dutch and German (compiled and arranged on an English alphabetical base by W E Clasen), *review* by S Whelan, 904
Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various Pore Sizes A Cell for Rapidly (G K Ackers and R L Steere), 436
Measuring Soil Hydraulic Conductivity Method of, *in situ* (Prof J N Luthin), 383
Mechanical Barrel-setting Calculators Reciprocals of the Integers from 1000 to 9999, with an Appendix on (T H Redding), *review* by Prof T A A Broadbent, 856
Mechanical Stress Effect of, on some Solid-State Polymerizations (Dr C H Bamford, Dr G C Eastmond and Dr J C Ward), 1036
Mechanics (L D Laudau and E M Lifshitz), translated from the Russian by J B Sykes and J S Bell, *review* by Dr B H Chirgwin, 389
  Electrodynamics and, *review* by Dr B H Chirgwin, 389
Mechanics of Vibration (Prof R E D Bishop and Prof D C Johnson), *review* by Prof W A Tuplin, 844
Mechanics (Quantum) Introduction to (Prof Robert H Dicke and Dr James P Wittke), *review* by S F Edwards, 1005
  Problems in (Dr I I Gol'dman, Dr V D Krivchenkov, V I Kogan and V M Galitskii), *review* by S F Edwards, 1005
  Problems in (Dr I I Gol'dman and Dr V D Krivchenkov), edited by Prof B T Geilikman (translated from the Russian by E Marquit and E Lepa), authorised revised edition, *review* by S F Edwards, 1005
  The Teaching of, *review* by S F Edwards, 1005
Mechanics (Thrust) Application of Palaeomagnetism to (D K Norris and R F Black), 933
Mechanik, Hydro- und Aerodynamik Gesammelte Abhandlungen zur Angewandten (Ludwig Prandtl), (herausgegeben von Walter Tollmien, Hermann Schlichting und Henry Gortler, schriftleitung F W Riegels), Teile 1-3, *review* by M James Lighthill, 841
Mechanism of Action of Liver Alcohol Dehydrogenase (Prof Hugo Theorell and Dr J S McKinley McKee), 47, *erratum*, 710
Mechanism linking Excitation of the Plasma Membrane with Contraction 'Glycerol Effect' and the (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
Mechanism of the Hepatoxic Action of Dialkylnitrosamines (Dr D F Heath), 170
Mechanism of Nicotinic Action at the Adrenal Medulla—Calcium as a Link in Stimulus-secretion Coupling (Prof W W Douglas and R P Rubin), 1087
Mechanism of Streptomycin Action on Bacteria—a Unitary Hypothesis (Dr Charles R Spotts and Prof R Y Stanier), 633
Mechanism (Feeding), of the Flea An Apparatus for Observations of the (M M J Lavoipierre and M Hamachi), 998
Mechanism (Possible), of Effect of 6-Mercaptopurine on Tumour Growth Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei— (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Mechanism (Probable), of Resistance of Varieties of Cocoa to Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl (Dr John A Spence), 278
Mechanism (Spawning), in the Male Lugworm (Dr D I D Howie), 1100
Mechanisms of Virus Infections (Royal Society Discussion on), 1246
Mechanisms (Cholinergic Transmission), for both Excitation and Inhibition in Molluscan Central Synapses (Dr L Tauc and Dr H M Gerschenfeld), 366
Mechanisms (Water-regulating) Role of, in Amphibian Morphogenesis—a Quantitative Hypothesis (Peter Tuft), 1049
Mechanization of the World Picture (Prof E J Dijksterhuis), translated by C Dikshoorn, *review* by J R Ravetz, 825
Mecseki, R, and others Antibacterial Synthetic Polypeptide Derivatives, 190
Medford, R D, and others A New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient Magnetic Fields, 622
Media Deficient in Sugar Kinetin-induced Meiotic-Prophase Acceleration and Stasis in *Tradescantia* Anthers cultured in (Prof G W R Walker and J. Dietrich), 889
Media (Continuous) Electrodynamics of (L D Landau and E M Lifshitz), translated from the Russian by J B Sykes and J S Bell, *review* by Dr B H Chirgwin, 389
Media (Fluid) Evidence for the Photo-Association of Aromatic Hydrocarbons in (Dr B Stevens), 725
Media (Porous) Distribution of Pressure for Flow of Gas through (G J Field and Dr H Watts), 1277
Medial Corpuscular Fragility and Haemoglobin Type Relationships between Red Blood Cell Potassium Concentrations, in Merino and Southdown Sheep (Prof J V Evans), 567
Medical Dictionary The British (edited by Sir Arthur Salusbury MacNalty), *review* by Dr K M Hawkins, 849
  A New, *review* by Dr K M Hawkins, 849
Medical Dictionary (Stedman's), twentieth edition, *review* by Dr K M Hawkins, 1222
Medical Entomology (Dr William B Herms and Dr Maurice T James), fifth edition, *review* by Prof D S Bertram, 298
Medical Men Shortage of (House of Lords Debate on), 1239
Medical Microscopy (Biological and) Scanning Techniques in (New York Academy of Sciences Conference on), 1030
Medical Research Gas Chromatography in (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 717
Medical Research, Fleming Memorial Fund for Grant of £48,000 to the University of Oxford, for the Sir William Dunn School of Pathology, 404
Medical Research, South African Institute for Publications, No 1, Vol 9, The Arthropod Parasites of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol 1, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
Medical Research in the British Caribbean, Standing Advisory Committee for Sixth Scientific Meeting, 26
Medical Research Council Special Report Series No 300, Cerebral Infarction—the Role of Stenosis of the Extracranial Cerebral Arteries (Dr Peter O Yates and Dr Edward C Hutchinson), 319
  Statement on Radioactive Fall-out and the Testing of Nuclear Weapons, 400
Medical Research Council (National Research Council and), of Canada University Support (1960-61), 308
Medical Research and the National Institutes of Health, Bethesda, Maryland (Dr Carl R Brewer), 791
Medical Treatment Recent Developments in (*Practitioner*, Vol 187, No 1120), 506
Medicine Chemistry in the Service of (Second British Congress on the History of Medicine and Pharmacy), 1017
  New Techniques in Biology and (International Atomic Energy Agency Conference on), 609
Medicine, Royal Society of Christmas Lectures, 1026
Medicine and Insect Parasites, *review* by Prof D S Bertram, 298
Medicine and Pharmacy Second British Congress on the History of (Chemistry in the Service of Medicine), (Worshipful Society of Apothecaries of London, in co-operation with the Chemical Society), 1017
  Third British Congress on the History of (The History of British Hospitals), 1241
Medicine (Science and), in Canada Research Grants in, 308
Medieval Glazed Pottery (English and Continental) A Spectroscopic Survey of (L C Thomas and J W C Musty), 1143
Medieval India (Ancient and) History of Sciences in (National Institute of Sciences of India Symposium on), 27
Mediterranean Fishes of the Family Istiophoridae (Dr Enrico Tortonese), 80
Medium Influence of Adding Salts to the on Counts of Phenol-treated *Escherichia coli* on Membrane Filters (N D Harris and J P Richards), 87
Medium (Deuterium Oxide) Effect of γ-Radiation on *Escherichia coli* grown in (Ernest Pollard), 177
Medium (A Simplified Culture), for the Production of Collagenase (Dr G H Warren and Jane Gray), 755
Medium Range Diffusion in the Atmosphere (Royal Meteorological Society Symposium on), 13
Medulla (Adrenal) Mechanism of Nicotinic Action at the—Calcium as a Link in the Stimulus-secretion Coupling (Prof W W Douglas and R P Rubin), 1087
Mee, Dr C H B Electrical Conductivity of Calcium Oxide at High Electric Fields, 350
Megaloblasts (Human) Abnormal Globin Formation in (Prof Austin S Weisberger and Ernest P Noble), 1261
Megashatter Cone Hypothesis of the Origin of Lunar Volcanoes (A J Cohen), 346
Méhes, Ch, and others Primary Embryonal Sex Ration in Normal Pregnancies determined by the Nuclear Chromatin, 476
Mehta, A, and others (prepared by) Representations of Primes by Quadratic Forms (edited by J C P Miller), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson, 97
Meikle, R D A Botanical Panopticon, *review*, 1221
Meiklejohn, Prof M F M Nutrition and Poultry (Wild Birds that have been used as Food for Man), 616
Meiotic-Prophase Acceleration and Stasis (Kinetin-induced), in *Tradescantia* Anthers cultured in Media Deficient in Sugar (Prof G W R Walker and J Dietrich), 889
Mejbaum-Katzenellenbogen, W, and others Preparation and Determination of Sulphosalicylo-soluble Proteins using Tannin, 262, *erratum*, 802
Meksyn, Dr D New Methods in Laminar Boundary-Layer Theory, *review* by E J Watson, 842
Melanesia Thalassaemia in (B Ryan), 75
Meldola Medal for 1961 (Society of Maccabaeans), 309
Melichar, V, and others Interrelationship between Fat and Sugar Metabolism in Infant Rats, 1296
Melissinos, A C, and others (edited by) Proceedings of the 1960 Annual International Conference on High Energy Physics at Rochester, *review* by Dr G H Stafford, 7
Melling, C T Appointed a member of the Advisory Council on Research and Development of the Ministry of Power, 115
Mellor, H C At the First British Insecticide and Fungicide Conference, 1140
Mellors, Robert C, and Carroll, Kenneth G A New Method for Local Chemical Analysis of Human Tissue, 1090
Melted Nuclear Emulsion Autoradiography using (Dr A C Kulangara), 437

Melting Processes (High-Temperature) A Cold Crucible for (H F Sterling and R W Warren), 745
Melts Preparation of Single-Crystal Graphite from (Pei Ching Li), 864
Meltzer, J Evaluation of the Activity of some Diphenyl Compounds on Winter Eggs of the Fruit Tree Red Spider, 474
Melville, Sir Harry Made a member of the Council for Scientific and Industrial Research, 1241
Melville, Dr R Awarded a 1961 Senior Research Fellowship by the New Zealand Department of Scientific and Industrial Research, 210 , work of, 210
Membrane Action Potential of the Heart Effects of Intensity of Driving Stimulus on the Shape of (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Membrane Conductance of Rabbit Ventricular Fibres Evidence for Independence of Voltage of the (Dr Edward A Johnson and J Tille), 663
Membrane Filters Influence of Adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on (N D Harris and J P Richards), 87
Membrane (Plasma) 'Glycerol Effect' and the Mechanism linking Excitation of the, with Contraction (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
Membrane (Synovial) Permeability of the, to Glycoproteins (Lars Sundblad, Dr Eric Jonsson and Erik Nettelbladt), 1192
Men and their Jobs, 607
Men (Medical) Shortage of (House of Lords Debate on), 1238
Men and Scorpions Spiders, (Theodore H Savory), *review* by Dr E Duffey, 829
Mendel, Dr Gerald A Increased Iron Absorption without Increase in the Rate of Erythropoiesis, 878
Mendelsohn, Dr D Metabolism of the Human Red Blood Cell, 619
Mendelsohn, Dr F (edited by) The Geology of the Northern Rhodesian Copperbelt, *review* by Prof J H Taylor, 98
Mendiola, L , and others Transamination and the Control of Mitochondrial Pathways, 820
Mengo–Semliki Virus Immunity Acrolein and (Dr George F Kamen), 986
Mennie, Prof J H *Obituary* of Dr Otto Maass, 16
Menschen Histologie und Mikroskopische Anatomie des (Prof W Bargmann), dritte Auflage, *review* by Dr F Jacoby, 1007
Mental Health Student—Report of a Conference held in London, 1961 (World University Service), 620
  Tenth Report of the Expert Committee on (United Nations, World Health Organization, Technical Report Series No 223, Programme Development in the Field of Mental Health), 932
Mental Health Book Review Index (American Foundation for Mental Hygiene), Vol 6, No 11, 113
Mental Hygiene, American Foundation for *Mental Health Book Review Index*, Vol 6, No 11, 113
Mental Patients Erythrocyte Cholinesterase-levels in (Dr George L Ellman and Dr Enoch Callaway), 1216
Menter, Dr J W Appointed director of the Tube Investments Research Laboratory, 21
6-Mercaptopurine (Effect of), on Tumour Growth Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Mercier, Dr R P Appointed lecturer in theoretical physics at the University of Bristol, 710
Merino Rams Seminal Degeneration induced in, by the Administration of Stilboestrol Dipropionate (G R Moule and P E Mattner), 364
Merino and Southdown Sheep Relationships between Red Blood Cell Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in (Prof J V Evans), 567
Merioneth Chitinozoa from the Ordovician Nod Glas Formation of (Prof F H T Rhodes), 275
Meristems Apical (Dr F A L Clowes), *review* by Dr A Allsopp, 830
Merril, Carl R Elimination of the Liquid Junction by using Glass Electrodes, 1087
Merrillees, M C R Muscle Receptors (Ultrastructure of both Spindle and Tendon Organ Endings and their relation to underlying Tissues), 806
Merz, W Microchemical Techniques (Determination of Active Hydrogen using Alkyl-substituted Metal Aluminium Hydrides), 411
Mesophilic into Thermophilic Micro-organisms Factor converting (Edward H Sie, Dr Harry Sobotka and Herman Baker), 86
Metabolism of Fatty Acids in Rabbit-Heart Sarcosomes Relationship between Oxidation of Isocitrate and (Dr W C Hulsmann), 1153
Metabolism of the Human Red Blood Cell (Dr D Mendelsohn), 619
Metabolism of Labelled Thyroxine Difference in, between Thyrotropic and Adrenotropic Mouse Pituitary Tumours (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Metabolism of Propionate by Homogenates of Normal Sheep Liver (R M Smith and W S Osborne-White), 868
Metabolism (Amino-Acid) New Renal Tubular Amino-Acid Transport System and a New Hereditary Disorder of (Dr C R Scriver, I A Schafer and M L Efron), 672
Metabolism (^{45}Ca-) Generalized Skeletal Response on Local Trauma in Young Rats studied by means of (Dr Jaromir Kolař and Dr Arnošt Babicky), 1297
Metabolism (Fat and Sugar), in Infant Rats Interrelationship between (P Hahn, O Koldovsky, V Melichar and M Novak), 1296
Metabolism (Phosphorus), in the *Avena* Coleoptile Effect of Indole-3-Acetic Acid (IAA) on (A Sen Gupta and S P Sen), 1291
Metabolism (Polysaccharide) Role of the Thymus in (G Csaba, G Tóth, Prof I Toro, Th Ács and L Csaki), 1304
Metabolism (Sulphate Transport and), by *Desulphovibrio desulphuricans* (Prof C Furusaka), 427
Metabolite (Amylobarbitone), in Human Urine Identification of an (J V Jackson and M S Moss), 553
Metabolites of *Myrothecium roridum* Tode Antibiotic Properties of Mycelium and (Andrzej Nespiak, Marian Kocor and Antoni Siewinski), 138
Metal Halides (Quadrivalent) Eight-Co-ordinate Diarsine Complexes of (Dr R J H Clark, Dr Jack Lewis, Prof R S Nyholm, Dr Peter Pauling and Dr G B Robertson), 222
Metal Titanium Oxide Bronzes Alkali (A D Wadsley and Sten Andersson), 551
Metal (Transition-) Complexes Cation Toxicity and the Stability of (Dr. William H R Shaw), 754
Metallic Lead and its Compounds Isolation of Radioactive Bismuth from (J R W Kerr, Dr D I Coomber and Dr D T Lewis), 546
Metallography A History of—the Development of Ideas on the Structure of Metals before 1890 (Prof Cyril Stanley Smith), *review* by Prof F C Thompson, 843
Metallurgical Laboratory (National), Jamshedpur Symposium on Pilot Plants in Metallurgical Research and Development, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Metallurgical Research and Development Symposium on Pilot Plants in, held at the National Metallurgical Laboratory, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Metallurgy of Beryllium (Nuclear Energy Committee of the Institute of Metals International Conference on), 1137
Metals Emission of Ultra-Violet and Visible Radiation from, by the Impact of High-Energy Hydrogen Ions (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Metals before 1890 A History of Metallography—the Development of Ideas on the Structure of (Prof Cyril Stanley Smith), *review* by Prof F C Thompson, 843
Metals, Institute of (Nuclear Energy Committee) International Conference on the Metallurgy of Beryllium, 1137
Metcalfe, Dr C R Structure, Life-History and Distribution of *Gnetum*, *review*, 1006
  Identification, Properties and Uses of Indian Timbers, *review*, 1110
Meteor Peas Gibberellic Acid and Chlorophyll Content of Leaves of (P Bishop and Prof C P Whittingham), 576
Meteorite (Sikhote–Alin) Uranium in the, and its relation to the Lead Method of Age Determination (Edward L Fireman and David E Fisher), 644
Meteorological Organization (World), (Unesco and the) Symposium on Changes of Climate, 1139
Meteorological Society (Royal) Symposium on Winds and Circulation in the Upper Atmosphere 12
  Symposium on Medium Range Diffusion in the Atmosphere, 13
Methaemalbumin Haemin–Protein Binding in Peroxidase and (Dr A C Maehly), 630
Methane (Atmospheric), Hydrogen and Stratospheric Water Origin of High Tritium Content of (Dr Richard Wolfgang), 1279
Methane (Atmospheric Hydrogen and) Isotopic Composition of (A E Bainbridge, Prof H E Suess and Irving Friedman), 648 , (K F Bishop, R T Taylor and A E J Eggleton), 649
Methane (Irradiation of), with 4-MeV Electrons Production of High Molecular Weight Products from the (R W Hummel), 1178
Methionine and Cystine Determination of Biological Availability of (D Guttridge, Dr D Lewis and J T Morgan), 753
L-Methionine-Methyl-^{14}C Inhibited Oviposition by Females of *Gryllus assimilis* (F), induced by Radioactive Males, using (Dr A A Abdel-Malek and D K McE Kevan), 681
Method of Administration and Effect of Progesterone (Effect of Progesterone on Pregnancy), (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329
Method of Calibrating Two-Sphere Non-directional Radiometers (Dr Walter Koch), 960
Method of Measuring the Mossbauer Effect (Dr J E S Bradley and J Marks), 1176
Method of Measuring Soil Hydraulic Conductivity *in situ* (Prof J N Luthin), 383
Method (Lead), of Age Determination Uranium in the Sikhote–Alin Meteorite and its relation to the (Edward L Fireman and David E Fisher), 644
Method (Micro-) for the Determination of Bradykininogen in Blood Plasma (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Method (New), of Estimating the Dry-Matter Intake of Grazing Sheep from their Faecal Output (J B Owen), 92
Method (New), for Local Chemical Analysis of Human Tissue (Robert C Mellors and Kenneth G Carroll), 1090
Method (New), of Preparing *Corynebacterium pyogenes* Toxoid with High Anti-Haemolysin Titre in Rabbits (Valerie Levy), 189
Method (Perchloric Acid–Naphthoquinone), for the Histochemical Localization of Cholesterol (Dr C W M Adams), 331
Methodology of Plant Eco-Physiology (Botanical Institute, Montpellier, Symposium on), 1241
Methods Modern Computing (National Physical Laboratory, Notes on Applied Science, No 16), second edition (Department of Scientific and Industrial Research), *review* by Dr R A Buckingham, 202
Methods (Conventional), of Converting Heat into Electricity (British Association for the Advancement of Science, Section A (Mathematics and Physics) and Section G (Engineering), Joint Discussion on), 701
Methods (Diffraction) Chemical Applications of (Bradford Institute of Technology Course on), 21
Methods (New), in Laminar Boundary-Layer Theory (Dr D Meksyn), *review* by E J Watson, 842
Methods (Nuclear Instruments and) Vol 11, No 1, Proceedings of the Second Accelerator Conference, Amsterdam, 1960 (edited by Prof K Siegbahn), 123
Methods (Physical), in Chemical Analysis (edited by Walter G Berl), Vol. I, second edition, *review* by Dr D T Lewis, 391
Methods (Preparative), of Polymer Chemistry (Wayne R Sorenson and Tod W Campbell), *review* by Dr I C McNeill, 490
Methods (Unconventional), of Energy Conversion (Prof D A Wright), 701
Methods and Techniques (Microchemical) Progress in (A J Barnard, jun , and John Y Steel), 410
A-Methopterin Inactivation of, by the Acetylating Enzyme System from Pigeon Liver (V Krishnamurthy and Beatriz M Braganca), 68
Methyl-1,2-Benzanthracenes and their Derivatives Carcinogenicity of the (Dr O Chalvet and Dr R Mason), 1070
Methyl Hydroxybenzoate Action of, on Nervous Conduction (Dr P W Nathan and T A Sears), 668
N-Methyl-Nitrosourethane (Carcinogenic) Interaction of the, with Sulphydryl Groups (Dr R Schoental), 670
Methylated Purines and Pyrimidines Crystal Structures of Salts of (R F Bryan and K Tomita), 812
Metropolitan Life Insurance Company, New York Statistical Bulletin, Vol 42, Voting Population at Record High , Recent Variations in Pneumonia–Influenza Mortality , Longevity of Industrial Policyholders in 1960 , Accident Death Rates Decreases in Most States, 515

Metropolitan Microchemical Society of the United States 1961 International Symposium on Microchemical Techniques, 410
Metzner, Ralph Learning Theory and the Therapy of Neurosis (*British Journal of Psychology*, Monograph Supplement No 13), 405
Mey, Prof J L At the twenty-seventh Conference of the International Federation for Documentation (Documentation of Management), 219
Meyers, M B Awarded a Fellowship in organic chemistry in the University of Glasgow, 1132
Mica–Quartz Clay (Kaolinite-hydrous) Moisture Expansion Relations for a Fired (Dr W F Cole), 737
Mice Action of Deoxyribonuclease and Ribonuclease on the Growth of Ehrlich Ascites Carcinoma in Mice (Dr Gaston de Lamirande), 52
  A Carcinogenic Action of Testosterone, provoking Uterine Tumours in (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
  Chromosomal Lesion associated with Carcinogen-induced Tumours in (June Lee Biedler, Lloyd J Old and Dr Donald A Clarke), 286
  Induction of Tumours in, with Tritiated Thymidine (Hermann Lisco, Renato Baserga and Walter E Kisieleski), 571
  Influence of Age of, on the Recovery from Experimental Sendai Virus Infection (Dr Leon Sawicki), 1258
  Riboflavin and Liver Sulphydryl-Levels in (Dr G Calcutt, D Doxey and Joan Coates), 164
Mice under Mild Hypothermia Enhanced Effect of Total-Body X-Irradiation in (Dr H J G Bloom and K B Dawson), 232
Mice (Adult) Acquired Tolerance to Homografts produced by Homologous Spleen Cell Injection in (Ronald D Guttmann and J Bradley Aust), 564
  Mast Cell Turn-over in (Prof Bruce E Walker), 980
Mice (Alarmed) Peroxide-like Substance in (V J Horgan and J St L Philpot), 662
Mice (Laboratory Rats and) Feeding of Bamboo Flowers to (V Mahadevan, Dr S S Negi and O N Agarwala), 470
Mice (New-born and Adult Living) Identification of the Chromosome Complements of (R G Edwards), 1316
Mice (Normal and Muscular Dystrophic) Excretion of Uncrystallized Urinary Calculi composed of Glycolipo-Protein by (C McGaughey), 1267
Michener, Prof C D Polymorphism in Insects (Non-genetic Polymorphism in Hymenoptera), 413
Michigan State University Grant of 700,000 dollars from the United States National Science Foundation, towards a 40-MeV cyclotron, 1239
Michl, Dr J (Zuman, Dr P, and) Role of Keto-Enol Tautomerism in the Polarographical Reduction of some Carbonyl Compounds, 655
Micro-Analysis X-Ray, 220
Microbarograph Records from the Russian Large Nuclear Explosions (E W Carpenter, G Harwood and T Whiteside), 857
Microbial Biochemistry, Ciba Lectures in (1959) Synthesis and Organisation in the Bacterial Cell (Dr E F Gale), *review* by Dr S Dagley, 489
Microbial Utilization of Olefins Incorporation of Molecular Oxygen during (Tomoyuki Ishikura and J W Foster), 892
Microbiological Examination of some Carbonaceous Chondrites (Dr George Claus and Prof Bartholomew Nagy), 594
Microchemical Methods and Techniques Progress in (A J Barnard, jun, and John Y Steel), 410
Microchemical Society of the United States (Metropolitan) 1961 International Symposium on Microchemical Techniques, 410
Microchemical Techniques (Metropolitan Microchemical Society of the United States 1961 International Symposium on), 410
Microdiffusion Technique (A Simple), for the Radioiodination of Proteins (Dr R N Banerjee and R P Ekins), 746
Micrographs (Electron) Estimation of Mass Thickness of Biological Samples from their (M L De), 546
Micromethod for the Determination of Bradykininogen in Blood Plasma (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Micro-organism (Thermophilic), of Uncertain Taxonomic Status from the Hot Springs of Tiberias (Israel), (David Kahan), 1212
Micro-organisms Continuous Culture of (Czechoslovak Academy of Science Second International Symposium on), 213
  Factor converting Mesophilic into Thermophilic (Edward H Sie, Dr Harry Sobotka and Herman Baker), 86
Micro-organisms (Intracellular *Rickettsia*-like), in certain Ticks (M A Roshdy), 186
Microplankton (Fossil) Classification of (Dr C Downie, G L Williams and Dr W A S Sarjeant), 471
Microsan X-Ray Analyser (Cambridge Instrument Co, Ltd), 220
Microscope A Flying-Spot Interference Television (Television Microscopy), (Dr P O'B Montgomery and L L Hundley), 1059
Microscope (Electron) Investigation with the, of the Sublimation of Ice Crystals at Low Temperatures (Prof Tokio Nei), 1177
Microscopy Electron, *review* by Prof R D Preston, 1220
  The Encyclopedia of (edited by Prof George L Clark), *review* by Dr R Barer, 833
  Practical (Dr C L Duddington), *review* by Dr S Bradbury, 904
  Section Cutting in (Dr H F Steedman), *review* by Dr S Bradbury, 904
  Television—A Flying-Spot Interference Television Microscope (Dr P O'B Montgomery and L L Hundley), 1059, Ultra-Violet Television Microscopy (Dr R Barer and J Wardley), 1060
  Ultra-Violet Television (Television Microscopy), (Dr R Barer and J Wardley), 1060
Microscopy in a Maze, *review* by Dr R Barer, 833
Microscopy (Biological and Medical) Scanning Techniques in (New York Academy of Sciences Conference on), 1030
Microscopy (Electron) Contribution of, to Polymer Morphology (Electron Microscope Society of America Symposium on), 610
  Fifth International Congress for, 611
  Histological Techniques for (Daniel C Pease), *review* by Dr V E Coslett, 5
  Histology and, *review* by Dr V E Cosslett, 5
  Proceedings of the European Regional Conference on (Delft, 1960), (edited by A L Houwink and B J Spit), *review* by Prof R D Preston, 1220
Microscopy (Electron), in the United States (Dr A R Taylor), 610
Microsomal Protein Synthesis produced by Dimethylnitrosamine Counteraction by Cysteine of Glycogenolysis and Inhibition of (Dr P Emmelot and I J Mizrahi), 42
'Microspot' Test for Antigens and Antibodies (Dr Joseph G Feinberg), 985
Microwave Dipoles (Satellite) Long-Range Radio Communication by, 109
Microwave Measurement Techniques (Institution of Electrical Engineers Conference on), 408
Microwave Spectrum of Fluoro-Acetonitrile (B E Job and Dr J Sheridan), 160
Midge (Sorghum), *Contarinia sorghicola* (Coq), in West Africa (K M Harris), 187
Migration (Cell), during Histogenesis of Cerebral Cortex in the Mouse Autoradiographic Study of (Dr J B Angevine, jun, and R L Sidman), 766
Migration (Leucocyte), in Inflammation (Sir Howard Florey and L H Grant) 801
Mihailovic, Dr Lj and Janković, Dr B D Effects of Intraventricularly Injected Anti-N Caudatus Antibody on the Electrical Activity of the Cat Brain, 665
Mihailovic, Dr Lj, and others Effects of Electrical Stimulation of Reticular Formation on the Lactic Acid Content of the Rat Brain, 1166
Mikhailov, A A, and others (edited by) Atlas of the Other Side of the Moon (translated into English by Leon Ter-Oganian), *review* by Prof Zdenek Kopal, 839
Mikroskopische Anatomie des Menschen Histologie und (Prof W Bargmann), dritte Auflage, *review* by Dr F Jacoby, 1007
Mikulski, Z B (Alexander, Dr P, and) Mouse Lymphoma Cells with Different Radiosensitivities, 572
Mild Hypothermia Enhanced Effect of Total-Body X-Irradiation in Mice under (Dr H J G Bloom and K B Dawson), 232
Miles, P W, and Helliwell, Ann Oxidase Activity in the Saliva of a Plant-Bug, 374
Military College of Science (Royal), Shrivenham Promotion of Dr G B Preston to Senior Principal Scientific Officer, 214
Milk Analysis of the Relationship between Deposition of Long-lived Fission Products and Level of Activity in (Dr W Anderson, L K Burton and J O Crookall), 1009
  Hormonal Control of Oxidized Flavour in (Harald Astrup), 559
Milk in Britain Iodine-131 in (Agricultural Research Council), 504, 707
Milk of the Rat Selective Secretion of Circulating Antibodies in the (E Ruth I Biswas), 883
Milk Industry Award Stanley Clifford (Society of Dairy Technology), 213
Milk Powder (Ministry of Agriculture, Fisheries and Food Department of Agriculture and Fisheries for Scotland, Department of Health for Scotland), 607
Milk (Cow's) Inherited Casein Variants in (Dr R Aschaffenburg), 431
Milk (Human) Lysozyme from (Dr Pierre Jollès and Jacqueline Jollès), 1187
Millar, D S (Pellet, P L, and) The Better Use of the World's Fauna for Food (Processing and Preservation of Meat in Under-developed Areas), 1113
Millar, M, and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Abrasion Testing of Sole Leather), 613
Millenson, Dr J R (Hurwitz, H M B, and) Animal Behaviour (Control of Behaviour by Reward), 208
Miller, Ann Ratner, and others Population Redistribution and Economic Growth, United States, 1870-1950, *review* by Prof E Grebenik, 853
Miller, J A, and Green, D H Age Determinations of Rocks in the Lizard (Cornwall) Area, 1175
Miller, J A, and Mudie, J D Potassium–Argon Age Determinations on Granite from the Island of Mahé in the Seychelles Archipelago, 1174
Miller, J C P (edited by) Representations of Primes by Quadratic Forms (prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson, 97
Miller, J C P (Haselgrove, C B, in collaboration with) Tables of the Riemann Zeta Function (Royal Society Mathematical Tables, Vol 6), *review* by Prof C A Coulson, 97
Miller, J I (Rush, C A, and) Microchemical Techniques (Barium Isopropyl Methylphosphonate as a rigorous Reference Standard for Carbon Hydrogen, Phosphorus, Barium and Alkoxyl), 411
Miller, P J The Species of the Teleostean Genus *Lebetus*, 675
Millman, Prof Jerome W, and others Water Supply, *review* by Prof W G V Balchin, 853
Millimetre Wave Generation and Reception Non-Linear Transmission Lines for (Dr D Walsh), 1064
Milne, Dr J G C Appointed lecturer in physics at the University of Bristol, 710
Milne-Redhead, E Flora of the Zambezi Basin, *review*, 1220
Milner, Dr G W C Recent Developments in Polarography, 213
Mineral Collection (National), Ottawa, 506
Mineral Oil (Kuwait) 1 2-Benzanthracene Derivatives in a (Dr W Carruthers and A G Douglas), 256
Mineral Resources of Uganda (compiled and edited by Dr J W Barnes), 921
Minerals (Rocks and), used by the British Ceramic Industry (Exhibition of, at the Geological Museum, London), 21
Misra, Dr S S History of Sciences in Ancient and Medieval India (Development of Medical Sciences in India), 27
Misreaching produced by Visual Cortex Lesions Role of Experience in (A Cowey and Dr L Weiskrantz), 1319
Mitchell, Dr E E L Spectroscopic Studies using Time-Resolved Techniques, 1032
Mitchell, J M Changes of Climate 1139
Mitchell, Dr P D Appointed senior lecturer in zoology at the University of Edinburgh, 507
Mitcheson, Prof J C Appointed chairman of the Geological Survey Board, 406
Mites (Spider) Relation between Organophosphorus-Resistance and Non-Diapause in (W Helle), 1314
Mites and Tongue-Worms of African Vertebrates, *review* by Dr F A Turk, 1222
Mitidieri, E, and others Paper Electrophoresis, *review* by Dr G V F Seaman 593
  Effect of Colchicine on Rat Liver Xanthine Oxidase, 686
Mitochondria from Rat Liver and Brain Effects of 7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide on (Bernhard Kadenbach and Prof Walter Luhrs), 174

Mitochondria of the Small Intestine of Vertebrates Comparison of the (P J Stanbury), 67
Mitochondrial Pathways Transamination and the Control of (Dr H Gutfreund, Dr K E Ebner and L Mendiola), 820
Mitra, Dr S, and others Nucleolar Succinic Dehydrogenase in Mouse Mammary Carcinoma Cells, 285
Mitton, R G Research in the Leather Industry, 612
Mitton, R G, and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Abrasion Testing of Sole Leather), 613
Miwatani, Dr T (Littman, Dr M L, and) Reversal of Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine for *Candida albicans* by Pyridoxine and Pyridoxamine, 1155
Mixed Cultures of *Rhodopseudomonas capsulatus* and *Azotobacter vinelandii* Production of Slime Substance in (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Mixed Saliva from Sheep (W R McManus), 1161
Mixer (Proposed Harmonic Generator or), for Optical Frequencies (Dr K D Froome), 859
Mixture (Amphetamine–Barbiturate) Modification of the Effects of an, by the Past Experience of Rats (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson), 533
Mizrahi, I J (Emmelot, Dr P, and) Counteraction by Cysteine of Glycogenolysis and Inhibition of Microsomal Protein Synthesis produced by Dimethylnitrosamine, 42
Mobility (Electrophoretic), and Detection of Haemolytic Activity of Streptolysins *O* and *S* in Agar-Gel (Extracellular Esterase of Group *A* Streptococci), (A H Stock and Jose Uriel), 435
Mode (Fundamental and a Lattice) A Difference Band of a, in the Infra-red Spectra of Lead and other Carbonates (C J H Schutte and K Buijs), 351
Mode of Action of the Efferent Olivo-Cochlear Bundle on the Inner Ear (Dr J E Desmedt and Dr P Monaco), 1263
Mode Characteristics and Coherence in Optical Ruby Masers (Dr I D Abella and Dr C H Townes), 957
Model (Energy-Level), for High-Resistivity Gallium Arsenide (J Blanc and L R Weisberg), 155
Model (A Statistical), for Chemists (Edward L Bauer), *review* by Dr D T Lewis, 102
Model (A Working), for the Upper Atmosphere (Luigi G Jacchia), 1147
Modern Computing Methods (National Physical Laboratory, Notes on Applied Science, No 16), second edition (Department of Scientific and Industrial Research), *review* by Dr R A Buckingham, 202
Modern Geometry, *review* by L Roth, 847
  Lectures on (Prof Beniamino Segre), *review* by L Roth, 847
Modern Physics (M S Smith), *review* by Prof H Lipson, 854
Modification of the Drying Technique Chromosome Preparation from Fresh and Cultured Tissues using a (M Fox and Dr I M Zeiss), 1213
Modification of the Effects of an Amphetamine–Barbiturate Mixture by the Past Experience of Rats (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson) 533
Modification of the Inotropic Activity of Calcium by Potassium (Winifred G Nayler), 268
Modification of the Properties of Flour Protein by Thiolated Gelatin (E E McDermott and J Pace), 657
Modified Cuvettes for Photoelectric Spectrometry (Dr Malcolm H Smith), 722
Modifying Influence on Linear Trend of *F*-Region Electron Density with Sunspot Number Atmospheric Scale Height as a (Jean M Bullen), 542
Moe, Kenneth Errors in Orbital Predictions for Artificial Satellites of Earth, 151
Moelwyn-Hughes, Dr E A The Study of Fast Reactions (Kinetics of Fast Reactions in Solution) 1136
Moffat, M E B, and others Microwave Measurement Techniques (Normal Cavity Techniques for the investigation of the Properties of Titanium Dioxide and Magnesium Titanate Ceramics at *S*, *X*, *J* and *Q* Bands), 410
Moiseiwitsch, Dr B L Excitation of the 2*s* State of Atomic Hydrogen by Electron Impact, 545
Moisture Expansion Relationships for a Fired Kaolinite-Hydrous Mica–Quartz Clay (Dr W F Cole), 737
Molar Polymorphism (Third), and the Timing of Tooth Formation (Stanley M Garn, Arthur B Lewis and Batsheva Bonné), 989
Molecular Biology and Population Structure (British Association for the Advancement of Science, Section D (Zoology) and Section K (Botany) Joint Symposium on), 414
Molecular Disarray in a Crystal Lattice produced by a Fission Fragment (Dr F P Bowden and L T Chadderton), 31
Molecular Oxygen Incorporation of, during Microbial Utilization of Olefins (Tomoyuki Ishikura and J W Foster), 892
Molecular Sieve (5A) Behaviour of, in Substractive Gas Chromatography (E R Adlard and B T Whitham), 966
Molecular Structure (Crystal and), of Diphenyl (Dr G B Robertson), (August 5, 593), *erratum*, 1026
Molecular Structure and Spectroscopy (Ohio State University Symposium on), 1241
Molecular Vibration Absence of Correlation between Odour and (K Buijs, C J H Schutte and F Verster), 751
Molecular Weight (High) Products from the Irradiation of Methane with 4-MeV Electrons Production of (R W Hummel), 1178
Molecular Weight (Low) Peptides Separation of, from Amino-Acids on 'DEAE-Sephadex' (P R Carnegie), 658
Molecules (Protein) Montmorillonite as a Caliper for the Size of (Prof A D McLaren and G H Peterson), 960
Molluscan Central Synapses Cholinergic Transmission Mechanisms for both Excitation and Inhibition in (Dr L Tauc and Dr H M Gerschenfeld), 366
Molten Polymers Unstable Flow of (J J Benbow, R V Charley and P Lamb), 223
Molybdenum Sesquisulphide Structure of (Prof F Jellinek), 1065
Molybdenum and Symbiotic Nitrogen Fixation by Alder (*Alnus glutinosa* Gaertn), (Dr J H Becking), 1204
Moment (Dipole) Heart Dipole Regions and the Measurement of (Dr M R Barber and Dr E J Fischmann), 141
Momentum (Angular), of Continua (Prof J S Dahler and Prof L E Scriven), 36
Monaco, Dr P (Desmedt, Dr J E, and) Mode of Action of the Efferent Olivo-Cochlear Bundle on the Inner Ear, 1263
Monaghan, M T (Littlewood, Dr K, and) Carbonyl Content of the Vitrain Component of Bituminous Coals, 128
Mondovi, B, and others Detection and Distribution of Enzymes for oxidizing Thiocysteamine, 557
Monie, A S Goblet Cells in the Swim Bladder of *Ophiocephalus striatus* (Bloch), 1313
Monier, R, and others Conservation of the Biological Activity of a Soluble Ribonucleic Acid, 169
Monodisperse Polystyrene Latexes in Arrays Optical Calibration of some (Dr Herbert E Kubitschek), 1148
Monohydrate (Asparagine) Structure of (G Kartha and A de Vries), 862
Monolayer Cultures of Frog Renal Cells Cultivation of (Dr Walter Auclair), 467
Mononucleotide (Phosphorus-32) Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extracellular Glucose Effect of Insulin on the (P Volfin, D Eboue and H Clauser), 166
Mononucleotide–Adenylyl Transferase (Nicotinamide), of Liver Nuclei Substrate Specificity and Inhibition of—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Monovalent Cations Effect of, on the Blood Pressure of Intact and Hypertensive Rats (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Monoxide (Carbon) Amounts of Oxides of Nitrogen and, in Cigarette Smoke, with and without Inhalation (C Bokhoven and H J Niessen), 458
Monoxide (Carbon) Oxidation Radiation Effects on Lithium-doped Nickel Oxide Catalysts in (T Braun and I Maxim), 548
Montan Wax Separation, Identification and Determination of the Fatty Acids of (D R Hewett, P J Kipping and P G Jeffery), 65
Montgomery, H Appointed lecturer in pathology at the University of Edinburgh, 507
Montgomery, Dr P O'B Scanning Techniques in Biological and Medical Microscopy (Recent Work in Flying-spot Microscopy), 1031
Montgomery, Dr P O'B, and Hundley, L L Television Microscopy—a Flying-Spot Interference Television Microscope, 1059
Montmorillonite as a Caliper for the Size of Protein Molecules (Prof A D McLaren and G H Peterson), 960
Moon Atlas of the Other Side of the (edited by N P Barabashov, A A Mikhailov and Yu N Lipskiy), translated into English by Leon Ter-Oganian, *review* by Prof Zdenek Kopal, 839
  The Hidden Face of the, *review* by Prof Zdenek Kopal, 839
Moon Atlas (V A Firsoff), *review* by Brian Warner, 1111
Moore, Dr A At the twenty-seventh Conference of the International Federation for Documentation (Problem of Information in the Pharmaceutical Industry), 219

  Promotion of Dr J M Burch to Senior Principal Scientific Officer, 214
  Promotion of Dr J T Stuart to Senior Principal Scientific Officer, 214
  Appointment of Dr J V Dunworth as deputy director, 606
  Notes on Applied Science No 23, Radiometric Standards and Measurements (E J Gillham), 1250
  Notes on Applied Science No 24, Photometric Standards and the Unit of Light (J S Preston), 1250
National Radio Astronomy Observatory The Australian, 1019
National Research Council of Canada Forty-fourth Annual Report (N R C 6322), 709
  Review of the, for 1961 (N R C 6421), 709
  Appointment of Dr A C Neish as director of the Atlantic Regional Laboratory, 1129
National Research Council and the Medical Research Council of Canada University Support (1960-61), 308
National Science Foundation (United States) Scientists and Engineers in the Federal Government, October 1958, 800
  Surveys of Science Resources Series, NSF 61-32, Funds for Research and Development in Industry (1958), 809
  Further allocation of 1,500,000 dollars for research work in the Antarctic, 919
  Appointment of Dr Randal M Robertson as associate director (research), 922
  Grant of 286,700 dollars to the University of Chicago, for a 4-MeV Van de Graaff machine, 1239
  Grant of 700,000 dollars to Michigan State University, towards a 40-MeV cyclotron, 1239
  Grant of 977,600 dollars to the University of Pittsburgh, towards an 18-MeV three-stage Van de Graaff machine, 1239
  Grant of 1,240,000 dollars to the University of Washington (Seattle), towards a 22-MeV, three-stage Van de Graaff machine for the Physics Department, 1239
  Grant of 499,200 dollars to Ohio State University, for a 55-MeV Van de Graaff machine, 1239
  Grant of 498,000 dollars to the State University of Iowa, for a 5 5-MeV Van de Graaff machine, 1239
National Union of Teachers Schools Television, a Discussion Document, 920
National University of Ireland Retirement of Prof J Doyle from the chair of botany in University College, Dublin, 1238
  Appointment of Dr Phyllis M Clinch to the chair of botany in University College, Dublin, 1238
National Youth Science Programme, 387
Native Africans Distribution of Group-specific Components (*Gc*) in the Sera of (Dr Jan Hirschfeld and Jean Sonnet), 766
Native Fibrin Powders (Human, Cow and Rabbit), as Anticoagulants (Dr A L Copley and Beverly Becher), 568
Native Legumes in the British Isles Perennial Nodules on (Dr J S Pate), 376
Native Orchids of Trinidad and Tobago (Dr Richard Evans Schultes), *review* by P Francis Hunt, 831
NATO (Advisory Group for Aeronautical Research and Development) AGARDograph No 47, Gas Sampling and Chemical Analysis in Combustion Processes (Prof G Tine), *review* by Dr C F Cullis, 1108
NATO (Advisory Group for Aeronautical Research and Development), and the University of Southampton Seminar on Astronautics, 310
Natu, W R , and others Cotton in India, Vol 3, *review* by Prof S C Harland, 200
Natural Glass from beneath Red Clay on the Floor of the Atlantic (Dr G D Nicholls and V T Bowen), 156
Natural History Courses on (Council for Nature), 802
  Observations and Experiments in (Alan Dale), *review* by B J G Maitland, 851
Natural History of Galaxies, *review* by Prof R O Redman, 838
Natural History Museum (Chicago) Fieldiana, Botany, Vol 30, No 4, Orchids of Peru (Charles Schweinfurth), 719
Natural Occurrence of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the Eastern Raccoon (Dr L G Clark, J I Kresse, R R Marshak and C J Hollister) 1312
Natural Resources Role of Science in the Development of, with particular reference to Iran, Pakistan and Turkey (Scientific Council of the Central Treaty Organization Symposium on), 609
Natural Rubber Producers' Research Association Symposium on Fundamental and Practical Approaches to Ageing Protection, 115
Natural Rubber Research Conference Proceedings of the (Kuala Lumpur, 1960), (sponsored by the Rubber Research Institute of Malaya, with the support of the Government of the Federation of Malaya and the Rubber Producers' Council of the Federation of Malaya), *review* by Dr W F Watson, 491
Natural and Synthetic Nucleic Acids Polynucleotides— (Dr Robert F Steiner and Dr Roland F Beers, Jr), *review* by Dr C B Reese, 836
Naturalist The Museum and the (Report of the Symposium at the British Museum (Natural History)), 212
Naturalists Trust, Ltd (Berkshire, Buckingham and Oxfordshire) Annual Report for 1960, 212
Naturally Occurring Derivatives of Proline Structures and Conformations of some (R J Abraham, K A McLauchlan, Shirley Dalby, Prof G W Kenner, R C Sheppard and L F Burroughs), 1150
Nature The Vision of (Sir Cyril Hinshelwood), 115
Nature, Council for Courses on Natural History, 802
Nature of Colicine Receptors (Dr Anna Mayr-Harting), 191
Nature of Increased Protein and DNA in Chronic Hepatic Injury (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and Hans Popper), 886
Nature of Sulphate Retention by Acid Soils (Monica Liu and G W Thomas), 384
Nature (General), of the Genetic Code for Proteins (Dr F H C Crick, Leslie Barnett, Dr S Brenner and Dr R J Watts-Tobin), 1227
Nature Conservation in Western Malaysia (edited by J Wyatt-Smith and P B Wycherley), 801
Nature Reserves, Society for the Promotion of Forty-fourth Annual Report, 608
Nature Society (Malayan) Special issue of the *Malayan Nature Journal*, Nature Conservation in Western Malaysia (edited by J Wyatt-Smith and P B Wycherley), 801
Nature, Use and Disposal Atomic Energy Waste—its (edited by E Glueckauf), *review* by A W Kenny, 846
Nautical Almanacs Astronomical and, 1240
Naval Architects, Royal Institution of Denny Scholarship in Marine Engineering (1961) awarded to David K Brown, 309
  Parsons Scholarship in Marine Engineering (1961) awarded to Alan B Turner, 309

Naval Laboratory (Stanford–Pacific) Conjugate Point Experiment (J E Lokken, J A Shand, Sir C S Wright, L H Martin, N M Brice and R A Helliwell), 319
Naval Radiological Defense Laboratory (United States) San Francisco Appointment of Dr Olivier Heroux as scientist-in-residence, 1026
Nayler, J H C, and others New Penicillins Stable towards both Acid and Penicillinase, 1183
Nayler, Winifred G Modification of the Inotropic Activity of Calcium by Potassium, 268
Naylor, A, and others Polysaccharide Content of the Prolapsed Nucleus Pulposus of the Human Intervertebral Disk, 868
Naylor, Prof J M, and Simpson, G M Bioassay of Gibberellic Acid using Excised Embryos of *Avena fatua* L, 679
Naylor, Prof R F *Obituary* by Prof Malcolm Crawford, 16
Neame, K D Phenylalanine as Inhibitor of Transport of Amino-Acids in Brain, 173
Nečas, Dr O Physical Conditions as Important Factors for the Regeneration of Naked Yeast Protoplasts, 580
Needham Dr A E Rate of Senescence, 579
  Evolution of Regeneration, and its Possible Bearing on Philosophy, 1255
Needles (West Ford) Interaction of, with Earth's Magnetosphere (Prof S F Singer), 303
  Interaction of, with the Earth's Magnetosphere and their Life-time (Prof S F Singer), 1061
Negi, Dr S S, and others Feeding of Bamboo Flowers to Laboratory Rats and Mice, 470
Nei, Prof Tokio Investigation with the Electron Microscope of the Sublimation of Ice Crystals at Low Temperatures, 1177
Neidhardt, F C (Fraenkel, D G, and) Manner of expressing Rate of Ribonucleic Acid Biosynthesis, 677
Neish, Dr A C Appointed director of the Atlantic Regional Laboratory of the National Research Council of Canada, 1129, work of, 1129
Nelken, Dr A (Gilboa-Garber, Nechama, and) Specific Antigens of Human Leucocytes and Thrombocytes, 466
Nematode *Ascaris lumbricoides* Localization of Esterase in the Cuticle of the (Dr D L Lee) 282
Nematode *Panagrellus redivivus* A Chamber for Culturing and Collecting the (E J Winkler and Prof David Pramer), 472
Nematodes Importance of Osmotic Potential as a Component of the Total Potential of the Soil Water on the Movement of (C D Blake), 144
Nematodes (Parasitic) Precipitating Antibodies in the Carpet Snake against (H Timourian, C Dobson and J F A Sprent), 996
Nematology at the Imperial College of Science and Technology, London (Prof B G Peters), 1027
Neoplastic Tissue (Oncolipin) Interaction between Lysozyme and a Phospholipid of (R Ferrari and S Matracia), 1187
Neoplastic Tissues Binding of *RP2-L*—a Nuclear Protein of—to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870
Nephrosis (Experimental) Plasma Albumin Catabolism in (Dr Alvin L Sellers, Joseph Katz and Sheldon Rosenberg), 562
Nerve-Endings (Sympathetic) Fate of Tritiated Noradrenaline at the (G Hertting and J Axelrod), 172
Nerve Stimulation (Hypogastric) Effect of some Smooth Muscle Stimulants on the Motor Response of the Isolated Guinea Pig Vas Deferens to (Dr Nils O Sjostrand), 1190
Nerves treated with Cetyltrimethylammonium Bromide Repetitive After-discharge produced by Drugs in (Michiko Okamoto and Prof Albert S Kuperman), 365
Nerves (Arteriolar), in the Guinea Pig Pancreas Fine Structure of the (Dr J D Lever and Dr A C Esterhuizen), 566
Nervous Conduction Action of Methyl Hydroxybenzoate on (Dr P W Nathan and T A Sears), 668
Nervous System (Autonomic), and the Occurrence of Visceral Lesions (Hiroshi Itoh, Teizo Kasahara, Kazua Amano, Koh Okamoto and Samon Tanabe), 1025
Nervous System (Central), of the Rat Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
Nervous Tissue Cytology of (Papers on, at the Annual General Meeting of the Anatomical Society of Great Britain and Ireland), 406
Nesbitt, Robert Malleson Appointed a trustee of the Wellcome Trust, 212
Nespiak, Andrzej, and others Antibiotic Properties of Mycelium and Metabolites of *Myrothecium roridum* Tode, 138
Netherlands Physical Society and the *Groupement Ampere* International Conference on Magnetic and Electric Resonance and Relaxation, 213
Nettelbladt, Erik, and others Permeability of the Synovial Membrane to Glycoproteins, 1192
Neuberger, Prof A, and others Biosynthesis of Porphyrins and Chlorophylls, 204
Neufeld, E L (Greenhow, J S, and) Winds and Circulation in the Upper Atmosphere (Winds at 80-100 km as revealed by Radar Reflexions from Meteor Trails), 13
Neuhaus, Prof Otto W, and Sogoian, Virginia P Presence of Haptoglobin in Synovial Fluid, 558
Neuhauser, R G (Williams, G Z, and) Scanning Techniques in Biological and Medical Microscopy (Quantitative Investigations in the Ultra-violet), 1031
Neural Differentiation Localization of Inhibitors of, in Chick Embryos (Dr A K Katoh), 997
Neurophysiological Research Probability Distribution Analyser programmed for (Dr W R Levick, Prof P O Bishop, W O Williams and Prof D G Lampard), 629
Neurophysiology Attention and In-Attention in (L Goldie and J M Green), 1116
Neuro-Psychopharmacology—Proceedings of the First International Congress of Neuro-Psychopharmacology, Rome, 1958 (edited by P B Bradley, P Deniker and C Radouco-Thomas), *review* by Prof W Ross Ashby, 392
Neurology of Language (Sir Russell Brain), 20
Neuronal Level Inhibitory Phenomena and 'Habituation' at the (B Holmgren and S Frenk), 1294
Neurons (Cholinergic), in Vertebrates (Dr Catherine Hebb), 527
Neurosis Learning Theory and the Therapy of (Ralph Metzner), 405
Neurospora crassa Effect of Kinetin on the Fertility of some Strains of (Barry O Lee), 288
Neutron Diffraction Examination (X-Ray and), of *p*-Diphenylbenzene (Prof C J B Clews Dr E N Maslen, H M Rietveld and T M Sabine), 154
Neutron Energy (14 MeV) The Reaction Silicon-29(n,α)Magnesium-26 at (Dr W M Deuchars and G P Lawrence), 1278
Neutron Intensity of Cosmic Rays World-wide Distribution of Diurnal Variation of the (Tsunekichi Kanno), 250
Neutron-Irradiated Ammonium Sulphate Behaviour of, on Thermal Annealing (Dr Nikola Getoff and Masaru Nishikawa), 61
New Antifungal Antibiotic of Potential Use in Agriculture Venturicidin, a (A Rhodes, K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient Magnetic Fields (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
New Hereditary Disorder of Amino-Acid Metabolism New Renal Tubular Amino-Acid Transport System and a (Dr C R Scriver, I A Schafer and M L Efron), 672
New Illustrated British Flora (Dr Roger W Butcher), Part I, Lycopodiaceae to Salicaceae, *review* by R D Meikle, 1221
New Indirect Fick Procedure for the Determination of Cardiac Output (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
New Long-acting Sulphonamides 4-Sulphanilamido-6-Methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,536)—Two (Dr R Clarkson and Dr A R Martin), 523
New Look in Physics Text-Books, *review* by G R Noakes, 99
New Medical Dictionary, *review* by Dr K M Hawkins, 849
New Method of Estimating the Dry-Matter Intake of Grazing Sheep from their Faecal Output (J B Owen), 92
New Method for Local Chemical Analysis of Human Tissue (Robert C Mellors and Kenneth G Carroll), 1090
New Method of Preparing *Corynebacterium pyogenes* Toxoid with High Anti-Haemolysin Titre in Rabbits (Valerie Levy), 189
New Methods in Laminar Boundary-Layer Theory (Dr D Meksyn), *review* by E J Watson, 842
New Mutant of Dermovaccinia Virus (Dr Isamu Tagaya, Dr Takashi Kitamura and Dr Yumiko Sano), 381
New Ninhydrin-Reactive Substance from Red Algae (Mitsuo Kuriyama), 969
New Penicillins A Survey of (Prof Robert Knox), 492
New Penicillins Stable towards both Acid and Penicillinase (F P Doyle, A A W Long, J H C Nayler and E R Stove), 1183
New Potent Analgetic Antagonist (Maxwell Gordon, John J Lafferty David H Tedeschi, Nathan B Eddy and Everette L May), 1089
New Prophylactic Trypanocidal Drug, 2,7-di-(*m*-amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium Chloride Dihydrochloride (*M & B* 4596), (S S Berg, K N Brown, J Hill and W R Wragg), 367
New Renal Tubular Amino-Acid Transport System and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
New Reversible Solid-State Transformation in Iron–Nickel Alloys in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavley), 962
New Sources of Energy (United Nations Conference on), 407
New Standard Work on Cocoa, *review*, 592
New Synthetic Detergents (Dr Nora H Johnson), 1142
New Techniques in Biology and Medicine (International Atomic Energy Agency Conference on), 609
New Ternary *R*-Phases with Silicon (D I Bardos, K P Gupta and Prof Paul A Beck), 744
New Test for Detecting Anaphylactic Sensitivity—the Basophil Reaction (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
New Thinking in School Chemistry (Organization for European Economic Co-operation), 404
New Tuberculostatic 1,3,4-Oxadiazolones Biological Spectrum of some with special reference to Cross-Resistance and Rates of Emergence of Resistance (Prof A E Wilder Smith and Hans Brodhage), 1195
New Type of Blocking Agent against 5-Hydroxytryptamine 5-Hydroxy-3-indoleacetamidine—a (Dr Laszlo Gyermek), 465
New Unsaturated Uronide isolated from Alginase Hydrolysate (Isami Tsujino and Tsuneyuki Saito), 970
New York Academy of Sciences Conference on Scanning Techniques in Biological and Medical Microscopy, 1030
New York University Combination of its two Physics Departments into a single all-University Department and appointment of Prof Bruno Zumino as its head, 507
New Zealand Flora of (Dr H H Allan), Vol I, Indigenous Tracheophyta, Psilopsida, Lycopsida, Filicopsida, Gymrospermae, Dicotyledones, *review* by Dr George Taylor, 1108
  Scientific Research in, 713
New Zealand Department of Scientific and Industrial Research Senior Research Fellowships awarded to Dr B H Howard and to Dr R Melville, 210
  Report for 1960-61, 713
New Zero Power Reactor *Nora*, a (Norwegian Atomic Energy Institute), 918
New-born and Adult Living Mice Identification of the Chromosome Complements of (R G Edwards), 1316
Newbrun, Ernest Application of Atomic Absorption Spectroscopy to the Determination of Calcium in Saliva, 1182
Newcomb, H R, and others Serotonin in the Small Intestine of Conventional and Germ-free Chicks, 380
Newer Synthetic Drugs Antibiotics and (Bradford Chemical Society, the Department of Chemical Technology of the Bradford Institute of Technology, and the Yorkshire Council for Further Education Symposium on), 1132
Newlands, Dr M J Chemistry in Industry, *review*, 902
Newman, Dr Charles Chemistry in the Service of Medicine, 1017
Newt Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the, following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Newton, Dr Alison Mechanisms of Virus Infections (Biochemical Aspects of Virus Infectivity), 1248
Newtonian (Non-) Measurements Rotation Viscometers and their Application to (Dr R McKennell), 308
Nichol, Dr D L The Better Use of the World's Fauna for Food (Recent Advances in the Processing of Fish) 1114

Nicholas, M Rheological Equipment (The Cattle Cube Hardness Tester), 308
Nicholls, Dr G A Quantitative Biology (Work of the New Zealand Forest Products, Ltd Laboratory in the fields of Bark Utilization, Pulping, Bleaching and Turpentine Refining), 26
Nicholls, Dr G D , and Bowen, V T Natural Glass from beneath Red Clay on the Floor of the Atlantic, 156
Nicholls, Dr J R Food Processing in relation to Health (Need for Food Preservation by means of Additives and the Precautions taken to ensure Safety), 601
Nichols, R B , and Brown, A E Microwave Measuring Techniques (Apparatus for Grading Dielectric Cubes according to their Exact Permittivity), 410
Nicholson, H H *Obituary* of Dr E McKenzie-Taylor, 706
Nickel Catalytic Decomposition of Ethylene on (Douglas W McKee), 654
Nickel Company of Canada, Ltd (International) Grant of 75,000 dollars to the Royal Ontario Museum, for a new Mineral and Gem Gallery, 607
Nickel Oxide Catalysts (Lithium-doped) Radiation Effects on, in Carbon Monoxide Oxidation (T Braun and I Maxim), 548
Nickel (Iron–) Alloys A New Reversible Solid-State Transformation in, in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavley), 962
Nickell, Dr L G , and Celmer, W D A Potent, Non-Toxic Plant-Growth Inhibitor from an Antibiotic Fermentation, 1098
Nicol, D L The Humber Laboratory, 1027
Nicol, Prof T (Charles, L M , and) Effect of Diethylstilboestrol on the Serum γ-Globulin in the Guinea Pig, 565
Nicol, Prof T , and others Response of the Reticulo-Endothelial System to Stimulation with Œstrogens, 978
Nicotiana glutinosa Leaves Movement of Tobacco Mosaic Virus through Epidermis of (Dr D G Kontaxis), 581
Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei Substrate Specificity and Inhibition of—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Nicotinic Action Mechanism of, at the Adrenal Medulla—Calcium as a Link in Stimulus-secretion Coupling (Prof W W Douglas and R P Rubin), 1087
Nidditch, Dr P- H Elementary Logic of Science and Mathematics, *review* by Prof R L Goodstein, 856
Nielsen, Jørgen C (Henningsen, K , and) A Rare Phenotype within the *Gm* System, 476
Niessen, H J (Bokhoven, C , and) Amounts of Oxides of Nitrogen and Carbon Monoxide in Cigarette Smoke, with and without Inhalation, 458
Nigeria Cotton-Growing in (Sir Frank Engledow), 1248
Night Sky in November, 213 , in December, 609
Nikuni, Prof Ziro, and others Effect of Temperature during Germination on the Crystalline Type of Starch in Soybean Seedlings, 239
Nilsson, Anna Demethylation of the Plant Œstrogen Biochanin *A* in the Rat, 358
Nilsson, Lennart (photography by) Life in the Sea (text by Prof Gosta Jagersten), *review* by Prof C M Yonge, 392
Nilsson, Ulf Serological Evidence of a Chromatographic Sub-fractionation of Human 7*S* γ-Globulin, 1301
Nine-spined and the Three-spined Stickleback Serological Relationships between the (Tadeusz Penczak), 673
Ninhydrin-Reactive Substance (New), from Red Algae (Mitsuo Kuriyama), 969
Nishibori, Dr K Isolation of Echinochrome *A* from the Spines of the Sea Urchin, *Stomopneustes variolaris* (Lamarck), 1293
Nishikawa, Masaru (Getoff, Dr Nikola, and) Behaviour of Neutron-Irradiated Ammonium Sulphate on Thermal Annealing, 61
Nisizawa, Prof Kazutosi (Handa, Nobuhiko, and) Structural Investigation of a Laminaran isolated from *Eisenia bicyclis*, 1078
Nitrate (Urea Cadmium) Crystallographic Data for Urea Calcium Nitrate and (Dr C G C Catesby), 254
Nitrate (Urea Calcium), and Urea Cadmium Nitrate Crystallographic Data for (Dr C G C Catesby), 254
Nitrogen in Sheep Saliva Secretion of (M Somers), 318
Nitrogen (Active) Formation of, using sources of Alternating Current and Direct Current (G G Mannella), 159
Nitrogen (Oxides of), and Carbon Monoxide Amounts of, in Cigarette Smoke, with and without Inhalation (C Bokhoven and H J Niessen), 458
Nitrogen Fixation Effect of Copper Deficiency in White Clover on (F H van der Elst, K J McNaught and W F Rolt), 1315
Nitrogen Fixation (Symbiotic), by Alder (*Alnus glutinosa* Gaertn) Molybdenum and (Dr J H Becking), 1204
Nitrogen-fixing Blue-Green Algae in Australian Rice Soils (Dr J S Bunt), 479
Niven, Prof Ivan, and Zuckerman, Prof Herbert S An Introduction to the Theory of Numbers, *review*, 856
Niwa, Dr Y At the twenty-seventh Conference of the International Federation for Documentation (History and Growth of the Japan Information Centre of Science and Technology), 219
Nixon, Dr J C , and others Recrystallization of Lead and Zinc Sulphides, 516
Njaa, A B K Effect of Derivatives of L-Cysteine on Growth of *Leuconostoc mesenteroides* (8042), 463
Noakes, G R A New Look in Physics Text-Books, *review*, 99
Nobbs, J M At the Third Australian Spectroscopy Conference (Input of Electrical Energy to an Arc Gap between Metal Electrodes) 928
Noble, Ernest P (Weisberger, Prof Austin S , and) Abnormal Globin Formation in Human Megaloblasts, 1261
Noble, Dr Mary At the First British Insecticide and Fungicide Conference (Soil Pests and Diseases of Agricultural Crops), 1140
Nobel Prize for Chemistry awarded to Prof M Calvin, 799
Nobel Prize for Physics awarded to Prof Robert Hofstadter and Prof R L Mossbauer, 799
Nobel Prize for Physiology awarded to Dr Georg von Békesy, 800
Nod Glas Formation (Ordovician), of Merioneth Chitinozoa from the (Prof F H T Rhodes), 275
Nodes (Pulmonary Lymph), of Human Beings Concentration of Inhaled Cerium-144 in (K Liebscher, Dr T Schonfeld and A Schaller), 1308
Nodules (Perennial), on Native Legumes in the British Isles (Dr J S Pate), 376
Nomenclature (Chemical) Chemico-Linguistics—Computer Translation of (A Garfield), 192
Non-Caking Coals Low Temperature Carbonization of, and Briquetting of Coal Fines (Regional Research Laboratory, Hyderabad, Symposium on), 406
Non-Diapause in Spider Mites Relation between Organophosphorus-Resistance and (W Helle), 1314
Non-Directional Radiometers (Two-Sphere) A Method of Calibrating (Dr Walter Koch), 960
Non-Diuretic Benzothiadiazine with Anti-hypertensive Properties (Dr Alan A Rubin, Franklin E Roth and Martin M Winbury), 176 , *erratum*, 802
Non-Goitrogenous Cabbage Cultivation of Goitrogenous and (J Sedlak), 377
Non-Linear Transmission Lines for Millimetre Wave Generation and Reception (Dr D Walsh), 1064
Non-Newtonian Measurements Rotation Viscometers and their Application to (Dr R McKennell), 308
Non-Redundant Stimulation Visual Effects of (Prof D M MacKay), 739
Non-Steroid Inhibitors of Pituitary Gonadotrophic Function (G E Paget, A L Walpole and D N Richardson), 1191
Non-Toxic Plant-Growth Inhibitor from an Antibiotic Fermentation A Potent (Dr L G Nickell and W D Celmer), 1098
Non-Uniform Fields in Dielectrics Rectifying Action of (Dr K C Kao), 650
Nonweiler, Prof T R F Astronautics (Re-entry Orbits), 310
Nora, a New Zero Power Reactor (Norwegian Atomic Energy Institute), 918
Noradrenaline A Central Action of 5-Hydroxytryptamine and (Dr D R Curtis and Dr R Davis), 1083
  Release of, from the Spleen of the Cat by Acetylcholine (K W Brandon and Helen Boyd), 880
Noradrenaline (Tritiated) Fate of, at the Sympathetic Nerve-Endings (G Hertting and J Axelrod), 172
Norepinephrine Particle-bound and Free Catecholamines in Dog Hearts and the Uptake of (A Wegmann and K Kako), 978
Nord, F F (edited by) Advances in Enzymology and related Subjects of Biochemistry, Vol 22, *review* by Dr E C Webb, 854
Norfolk Broads The (British Association for the Advancement of Science, Section E (Geography) and Section K (Botany), Discussion on), 314
Normal Guinea Pigs (Starved and) Variation in Lyoglycogen in (W J C Wilkinson and J H Kugler), 466
Normal Pregnancies Primary Embryonal Sex Ratio in, determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch Méhes), 476
Normal Sheep Liver Metabolism of Propionate by Homogenates of (R M Smith and W S Osborne-White), 868
Normal Uninfected Serum-free Cell Cultures Cytopathic Protective Factor, its Production by (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Normal and Muscular Dystrophic Mice Excretion of Uncrystallized Urinary Calculi composed of Glycolipo-Protein by (C McGaughey), 1267
Normal and Pathological Cerebrospinal Fluid Antithrombin Activity of (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Normal and Regenerating Rat Liver Effects of Irradiation on the Incorporation of Amino-Acid into (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Normal and Tumour Strain Cells Action of Radiation on Synthesis of Deoxyribonucleic Acid in (Dr John Seed), 944, *erratum*, 1241
Norman, Dr L G The Vehicle Driver (Bus Drivers), 1245
Normed Rings (M A Naimark), translated from the first Russian edition by Leo F Boron, *review* by Dr F Smithies, 201

Norrish, Prof R G W The Study of Fast Reactions (Isothermal Reactions of Atoms and Radicals by Flash Photolysis), 1137
North America Transmission of Clover Phyllody Virus by *Aphrodes bicinctus* (Schrank) in (Dr L N Chiykowski), 581
North America (Plant Phenolics Group of) Inaugural Meeting, 418
  Symposium on the Biochemistry of Plant Phenolic Substances, 418
  Election of Officers, 418
North Kenya Banks Plankton on the (J Wickstead), 890
North-east Pacific Occurrence of *Phyllochaetopterus claparedii* McIntosh in the (R Phillips Dales), 1208
Northern Rhodesian Copper Deposits Origin of the, *review* by Prof J H Taylor, 98
Northern Rhodesian Copperbelt The Geology of the (edited by Dr F Mendelsohn), *review* by Prof J H Taylor, 98
Norton, L J , and others α-Manganese Phases containing Technetium-99, 744
Norton, Stata, and Colville, Kenneth I Antagonism of Reserpine by Intraventricular Bretylium, 72
Norway Caesium-137 and Strontium-99 in Precipitation, Soil and Animals in (T Hvinden and A Lillegraven), 1144
Norwegian Atomic Energy Institute Inauguration of *Nora*, a New Zero Power Reactor, 918
Novak, M , and others Interrelationship between Fat and Sugar Metabolism in Infant Rats, 1296
Novel Electrostatic Machine—the Corona Motor (J D N Van Wyk and G J Kuhn), 649
Novel Type of Antioxidant related to Polyporic Acid (Dr G J Bennett and Dr N Uri), 354
Nuclear Accidents A Warning System for (Prof F W Spiers), 31
Nuclear Chromatin Primary Embryonal Sex Ratio in Normal Pregnancies determined by the (Prof F E Szontagh, A Jakobovits and Ch Méhes), 476
Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the Female White Rat during the Œstrual Cycle Variations in the (E Brañez and H Roels), 1043
Nuclear Emulsion (Melted) Autoradiography using (Dr A C Kulangara), 437
Nuclear Energy in O E.E C Countries, 1961-1962 Catalogue of Courses on (Organization for Economic Co-operation and Development), new edition, 405

Nuclear Energy Agency (European), of the Organization for Economic Co-operation and Development Catalogue of Courses on Nuclear Energy in O E E C Countries (1961-1962), new edition, 405
Nuclear Energy Agency (European), of the Organization for European Economic Co-operation Third Report on the Activities of the Agency, 616
Nuclear Energy Society (British) Establishment of the, in succession to the British Nuclear Energy Conference, 1022
Nuclear Engineers Materials for (edited by Dr A B McIntosh and T J Heal), *review*, 392
Nuclear Explosion on October 30, 1961 Round-the-World Sound Waves produced by the, and their Effect on the Ionosphere at Sodankyla (G Rose, J Oksman and E Kataja), 1173
Nuclear Explosions (Russian Large) Microbarograph Records from the (E W Carpenter, G Harwood and T Whiteside), 857
Nuclear Fission The Balance of Energy in (G N Walton), 1062
Nuclear Instruments and Methods Vol 11, No 1, Proceedings of the Second Accelerator Conference, Amsterdam, 1960 (edited by Prof K Siegbahn), 123
Nuclear Magnetic Resonance Spectroscopy of Proteins—the Hydrogen Bonding of Water in Bovine Serum Albumin Solutions (F A Bovey), 324
Nuclear Physics Accelerators for Low-Energy, 1239
  Rutherford Jubilee International Conference on (Dr A Herzenberg), 794
Nuclear Protein of Neoplastic Tissues Binding of *RP2-L*—a, to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870
Nuclear Reactor Stability (Dr A Hitchcock), *review*, 203
Nuclear Research (European Organization for) See *under* CERN
Nuclear Science Ceramics in (Basic Science Section of the British Ceramic Society Meeting on), 21
Nuclear Science, National Institute for Research in Appointment of Dr J Howlett as head of the *Atlas* Computer Laboratory, 918
Nuclear Spin of Protoactinium-231 from Hyperfine Splitting (E W T Richards, A Ridgeley, N J Atherton and H S Wise) 444
Nuclear Structure Proceedings of the International Conference on (Kingston, Canada, 1960), edited by D A Bromley and E W Vogt, *review* by D L Allan, 203
Nuclear Weapons Radioactive Fall-out and the Testing of—Statement by the Medical Research Council, 400
Nuclear-Weapons Tests (Russian), of September 1961 Radioactivity in Rainfall during September 1961 following the (Keith Boddy), 443
Nuclear (Sub-) Preparations from Rat Liver Nuclei Incorporation of ^{14}C-Glycine by (K R Rees, Hazel F Ross and G F Rowland), 171
Nuclei (Haploid and Diploid) A Heterocaryon possessing (Chiyoko Takeichi and Prof Yonosuke Ikeda), 1317
Nuclei (Liver) Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Nuclei (Rat Liver) Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from (K R Rees, Hazel F Ross and G F Rowland), 171
Nucleic Acid Preparations (Purified) Transmission of Mouse Leukaemia with (Dr Esther F Hays), 230
Nucleic Acid Samples Ferromagnetic Inclusions in (W M Walsh, jun , R G Shulman and R D Heidenreich), 1041
Nucleic Acid and Protein Components Dissociation of Foot-and-Mouth Disease Virus into its (F Brown and B Cartwright), 1163
Nucleic Acids Polynucleotides—Natural and Synthetic (Dr Robert F Steiner and Dr Roland F Beers, Jr), *review* by Dr C B Reese, 836
  Specific Partial Hydrolysis of, in Nucleotide Sequence Studies (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038 .
Nucleolar Succinic Dehydrogenase in Mouse Mammary Carcinoma Cells (P De, R Chatterjee and Dr S Mitra), 285
Nucleolus of Intestinal Carcinoma of the Newt Two Types of Ribonucleoprotein in the, following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Nucleoprotein (Thymus), in Solution Effect of Gamma-Rays on (Dr A R Peacocke and Dr B N Preston), 228
Nucleotide Sequence Studies Specific Partial Hydrolysis of Nucleic Acids in (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Nucleotide Sequences (Chromatography and), of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet (T Hudnik-Plevnik and Dr L A Stocken), 554
Nucleotides (Acid-soluble), of *Staphylococcus aureus*—Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of Penicillin (Dr J J Saukkonen), 816
Nucleotides (Adenine), in Ion-Exchange Chromatography Effect of Charcoal on the Behaviour of (U Pethiyagoda), 452
Nucleotides (Adenine), in the Muscles of some Marine Invertebrates Changes in (Ken-ichi Arai and Tsuneyuki Saito), 451
Nucleus (Atomic) Jubilee of the, 505
Nucleus (Ice) Requirements of an (G R Edwards and L F Evans), 448
Nucleus Pulposus ((Prolapsed), of the Human Intervertebral Disk Polysaccharide Content of the (Dr F Happey, Dr A Wiseman and A Naylor), 868
Number of Re-Circulations of Chick Embryo Erythrocytes (L Lemez and Z Rychter), 1298
Numbers An Introduction to the Theory of (Prof Ivan Niven and Prof Herbert S Zuckerman), *review*, 856
Nut (Ground-) Variety, Mani pintar (J McEwen), 92
Nutrition Fish in (Dr C L Cutting), 1013
Nutrition Society Symposium on Agricultural Problems in Developing Countries, 1028
Nutrition Society (Scottish Group) Symposium on Nutrition and Poultry, 615
Nutrition and Dietetics World Review of (edited by Dr Geoffrey H Bourne, assisted by Eileen M H Wilson), Vol 2, *review* by Dr W R Aykroyd, 1006
Nutrition and Poultry (Scottish Group of the Nutrition Society Symposium on), 615
Nutritional Relationships of Fishes Mathematical Theory of, *review* by L Birkett, 297
Nutritional Requirements for the Induced Formation of Malic Enzyme in *Lactobacillus arabinosus* (17-5), (Sheila M Bocks), 89
Nuts (Ground-) Toxicity associated with certain Samples of (Dr M C Lancaster, F P Jenkins and J McL Philp), 1095 , (Dr K Sargeant, Ann Sheridan, J O'Kelly and R A Carnaghan), 1096
Nutten, Dr A J (Belcher, Prof R , and) Quantitative Inorganic Analysis, second edition, *review* by Dr G Kakabadse, 836
Nuzzo, Fiorella, and others Somatic Chromosomes of the Gorilla, 225
Nyholm, Prof R S , and others Eight-Co-ordinate Diarsine Complexes of Quadrivalent Metal Halides, 222

OAK Ridge National Laboratory Technical Publications of the, 1240
Observations on the Feeding Mechanism of the Flea An Apparatus for (M M J Lavoipierre and M Hamachi), 998
Observations (Riometer), during a Solar Eclipse (M A Gordon), 249, *erratum*, 1132
Observations and Experiments in Natural History (Alan Dale), *review* by B J G Maitland, 851
Observatory The Australian National Radio Astronomy, 1019
  The Norman Lockyer (Prof G K T Conn), 108
Observatory (Norman Lockyer) Retirement of D R Barber as superintendent, 112
Observatory (Royal Greenwich) Promotion of B E J Pagel to Senior Principal Scientific Officer, 214
  Changes in Times of International Time Signal, 1023
Obstruction (Chronic), of the Rabbit Appendix Morphological Changes following Transplantation and (J A Williams, W O Griffen, jun , and A Sharma), 877
Occlusion (Aortic), resembling Acute Aortic Embolism Syndrome in Cats Production of (Roy K Imhoff), 979
Occupational Hygiene Society (British) Meeting on the Vehicle Driver, 1245
Occupational Versatility and Planned Procrastination (Prof Alec Rodger), 607
Occurrence of Graywacke in the Lower Siwaliks, Simla Hills (D B Sikka, M N Saxena, S B Bhatia and S P Jain), 61
Occurrence of a Hyperglycaemic Factor in the Corpus Cardiacum of an Insect (J E Steele), 680
Occurrence of Magnesite–Dolomite Sediments in South Australia (Prof A R Alderman and C C von der Borch), 861
Occurrence of *Phyllochaetopterus claparedii* McIntosh in the North-east Pacific (R Phillips Dales), 1208
Occurrence of Sedoheptulose in Carpophores and Basidiospores of *Inocybe* Species (Robert G Benedict, Prof Varro E Tyler, jun , Lynn R Brady and Daniel E Stuntz), 1080
Occurrence in Three Racial Groups Quantitative Sub-Groups of the *B* Antigen in Man and their (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Occurrence of Visceral Lesions Autonomic Nervous System and the (Hiroshi Itoh, Teizo Kasahara, Kazua Amano, Koh Okamoto and Samon Tanabe), 1025
Occurrence (Natural), of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the Eastern Raccoon (Dr L G Clark, J I Kresse, R R. Marshak and C J Hollister), 1312
Oceanic Differentiation Continental and (Prof J D Bernal), 123, 125 ; (Dr Robert S Dietz), 124 , (Prof J Tuzo Wilson), 125
Oceanographic Commission The Intergovernmental (Ronald I Currie), 1015
Oceanography Physical (Prof Albert Defant), *review* by Dr J C Swallow, 101
Odagiri, Satoshi (Koyanagi, Tatsuo, and) Effects of the Sulphur Amino-Acids on the Vitamin A Content in Liver of Rats, 168
O'Donoghue, Prof C H Traite de Zoologie, *review*, 590
Odour and Molecular Vibration Absence of Correlation between (K Buijs, C J H Schutte and F Verster), 751
Oertelis, S J (Lafferty, Dr K J , and) Attachment of Antibody to Influenza Virus, 764
Œstradiol-17-β Enhancement of Steroidogenesis by Rat Adrenal Slices *in vitro* with (Prof Julian I Kitay), 358
Œstrogen Content of Plants as a Function of Conditions of Culture (Prof. R Ferrando, M M Guilleux and A Guerrillot-Vinet), 1205
Œstrogen (Plant), Biochanin *A* in the Rat Demethylation of the (Anna Nilsson), 358
Œstrogens Response of the Reticulo-Endothelial System to Stimulation with (Prof T Nicol, D L J Bilbey, J Cordingley and C Druce), 978
Œstrogens (Urinary Conjugated) Purification of, by Gel Filtration (C G Beling), 326
^{14}C-Œstrone Interaction of, with Tryptophan in the Presence of Peroxidase (Dr P H Jellinck and Louise Irwin), 660
Œstrous-inducing Activity of Testosterone in the Ewe (D R Lindsay and Prof T J Robinson), 761
Œstrual Cycle Variations in the Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the Female White Rat during the (E Brañez and H Roels), 1043
Œstrus (Persistent Vaginal) Luteinizing Hormone in (Dr G P van Rees and Dr J J van der Werff ten Bosch), 876
Ogg, C L , and co-workers Microchemical Techniques (Use of a Dynamic Flow Technique in place of the usual Static Drop Method for the Thermistorized Determination of Molecular Weight), 411
Ogland, J W At the Twelfth International Astronautical Congress (Use of Ultra-violet Light for Communications), 1245
O'Gorman, F A Fur Seals Breeding in the Falkland Islands Dependencies, 914
O'Grady, Dr F W Appointed reader in bacteriology at St Bartholomew's Hospital Medical College, London, 1132
Ohio State University Grant of 499,000 dollars from the United States National Science Foundation, for a 5 5-MeV Van de Graaff machine, 1239
  Symposium on Molecular Structure and Spectroscopy, 1241
Ohman, E Appointed the first full-time officer of the Universal Decimal Classification at The Hague, 219
Öhman, Prof Yngve Polarized Thermal Emission from Narrow Tungsten Filaments, 254
Oil (Kuwait Mineral) 1,2-Benzanthracene Derivatives in a (Dr W. Carruthers and A G Douglas), 256
Oil Pollution of Marine Organisms (Dr M George), 1209

Oil (Volatile Mustard), of *Brassica juncea* Seeds (J S Hemingway, H J Schofield and Dr J G Vaughan), 993
Okamoto, Koh, and others Autonomic Nervous System and the Occurrence of Visceral Lesions, 1025
Okamoto, Michiko, and Kuperman, Prof Albert S Repetitive After-discharge produced by Drugs in Nerves treated with Cetyltrimethylammonium Bromide, 365
O'Kelly, J, and others Toxicity associated with certain Samples of Groundnuts, 1096
Oksman, J, and others Round-the-World Sound Waves produced by the Nuclear Explosion on October 30, 1961, and their Effect on the Ionosphere at Sodankylä, 1173
Okuda, Prof Azuma, and Kobayashi, Michiharu Production of Slime Substance in Mixed Cultures of *Rhodopseudomonas capsulatus* and *Azotobacter vinelandii*, 1207
Old, Lloyd J, and others Chromosomal Lesion associated with Carcinogen-induced Tumours in Mice, 286
Old Red Sandstone of Brown Clee Hill and the Adjacent Area, 1, Stratigraphy (Harold William Ball and David Lawrence Dineley), 2, Palaeontoloy (Errol Ivor White), (Bulletin of the British Museum (Natural History), Geology, Vol 5, No 7), 1250
Oldfield, Prof R C Speech (Development of Techniques for the Analysis of Specific Derangements of Speech), 602
Olduvai, East Africa Age of the Basalt Flow at (Prof G H R von Koenigswald, Prof W Gentner and H J Lippolt), 720
Olefins Incorporation of Molecular Oxygen during Microbial Utilization of (Tomoyuki Ishikura and J W Foster), 892
Olivo-Cochlear Bundle (Efferent) Mode of Action of the, on the Inner Ear (Dr J E Desmedt and Dr P Monaco), 1263
Olkin, Ingram, and others (edited by) Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling, *review* by Dr D E Barton, 846
Olsson, Bertil (Augustinsson Dr Klas-Bertil, and) Sex Hormones as a Possible Factor controlling Biosynthesis of Arylesterase, 969
Olver, Sir Arthur *Obituary* by G Williamson, 17
Olver, F W J (edited by) Bessel Functions, Part 3, Zeros and Associated Values (Royal Society Mathematical Tables, Vol 7), *review* by Prof C. A Coulson, 97
Ommanney, F D The Better Use of the World's Fauna for Food (Sea Fisheries in Tropical Areas), 1113
Oncolipin (Neoplastic Tissue) Interaction between Lysozyme and a Phospholipid of (R Ferrari and S Matracia), 1187
Oncology Conceptual Advances in Immunology and (University of Texas Sixteenth Annual Symposium on Fundamental Cancer Research), 1132
Ontario Museum (Royal) New Mineral and Gem Gallery, 607
O'Nyong-nyong Fever (J D Gillet, M C Williams, J P Woodall, P S Corbet and J M Ellice), 30
Oparin, Academician A I At the Fifth International Congress of Biochemistry, 1115
Ophiocephalus striatus (Bloch) Goblet Cells in the Swim Bladder of (A S Monie), 1313
Ophiodon elongatus (Lingcod) Penetration of Spines from a Marine Diatom into the Gill Tissue of (Dr Gordon R Bell), 279
Opic, Dr Uno Appointed lecturer in applied mathematics at Queen's University, Belfast, 710
'Opinions of the Late and Best Phisitians', *review* by Kenneth Bloor, 848
Oppenheimer, Dr Carl H Appointed research associate professor at the Institute of Marine Science, University of Miami, 710
Optical *F* Absorption Band (Dr Harold A Papazian), 1286
Optical Calibration of some Monodisperse Polystyrene Latexes in Arrays (Dr Herbert E Kubitschek), 1148
Optical Frequencies Proposed Harmonic Generator or Mixer for (Dr K D Froome), 859
Optical Masers Interstellar and Interplanetary Communication by (Dr Peter van de Kamp), 348, (Dr Charles H Townes and Dr Robert N Schwartz), 348
Optical Ruby Masers Mode Characteristics and Coherence in (Dr I D Abella and Dr C H Townes), 957
Oral Administration of *Mycobacterium johnei* Susceptibility of Hamsters to the (N J L Gilmour and J G Brotherston), 1202
Orang-Utan (*Pongo pygmaeus*) Chromosomes of the (Dr Brunetto Chiarelli), 285
Orbit in Domestic Animals Anatomy and Histology of the Eye and (Prof Jack H Prince, Prof Charles D Diesem, Prof Irma Eglitis and Gordon L Ruskell), *review* by Dr E N Willmer, 295
Orbital Predictions for Artificial Satellites of Earth Errors in (Kenneth Moe), 151
Orchids Peruvian (V S Summerhayes), 719
Orchids of Peru (Charles Schweinfurth), 719
Orchids (Native), of Trinidad and Tobago (Dr Richard Evans Schultes), *review* by P Francis Hunt, 831
Orcinol Oxidation Effect of Copper on Products of (Dr T F Slater), 420
Order The Search for—the Development of the Major Ideas in the Physical Sciences from the Earliest Times to the Present (Cecil J Schneer), *review* by Prof Herbert Dingle, 901
Ordish, G At the First British Insecticide and Fungicide Conference (Introduction of Insecticides and Fungicides into Agricultural Practice Overseas), 1141
Ordovician Nod Glas Formation of Merioneth Chitinozoa from the (Prof F H T Rhodes), 275
Orgam, G R Appointed to a Research Fellowship in industrial metallurgy in the University of Birmingham, 406
Organ-Specific Antiserum Apparent Induction of Malignant Tumours by (Prof H N Green), 1201
Organic Chemistry Advanced (Prof G W Wheland), third edition, *review* by Dr D T Lewis, 835
  An Electronic Outline of (Dr S Horwood Tucker), *review* by Dr Neville H P Smith, 7
Organic Chemistry of High Polymers An Introduction to the (Prof Carl S Marvel), *review* by Dr I C McNeill, 591
Organic Compounds Pyrolysis and Gas Chromatography for the Detection of the Benzene Ring in (J H Dhont), 747
Organic Extraction from Fused Uranium Chlorides (M Taube and Z Borkowska), 745
Organic Matter Cycle (Dynamic), in Soils Aspects of the (Welsh Soils Discussion Group Discussion on), 309
Organic Salts Influence of some, on the Absorption of Potassium by Vermiculite (Prof M M Mortland), 481
Organic Silicon Compound (Carbon-Functional), Dimethyldi-(4-hydroxyphenyl)-silane Allergy to a (Dr Sigfrid Fregert and Dr Hans Rorsman), 989
Organisation in the Bacterial Cell Synthesis and (Dr E F Gale), *review* by Dr S Dagley, 489
Organischen Chemie Lehrbuch der (Prof Paul Karrer), 13 Auflage, *review* by K H Overton, 855
Organisms (Marine) Oil Pollution of (Dr M George), 1209
Organization for Economic Co-operation and Development (European Nuclear Energy Agency) Catalogue of Courses on Nuclear Energy in O E E C Countries (1961-1962), new edition, 405
Organization for European Economic Co-operation Report of the Steering Committee for Nuclear Energy and Council Decision on the Establishment of a Supervision and Emergency Warning System in Cases of Increase in Environmental Radioactivity, 31
  New Thinking in School Chemistry, 404
Organization for European Economic Co-operation (European Nuclear Energy Agency) Third Report on the Activities of the Agency, 616
Organization for European Economic Co-operation (Office for Scientific and Technical Personnel) Television for School Science—Report on an O E E C Seminar, Ashridge (1960), 28

Organophosphorus-Resistance and Non-Diapause in Spider Mites Relation between (W Helle), 1314
Organs (Radiosensitive), in Rats exposed to X-Rays Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some (Dr M Quintiliani, M Boccacci and L Tentori), 573
Oriental Termites Contributions to the Systematics of (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Orientation of Quiet Auroral Arcs A Morning Discontinuity in the (Bengt Hultqvist, Alv Egelard and Georg Gustafsson), 956
Origin of Anomalous Rayleigh Scattering Lattice-like Vibrations in Associated Liquids and the (J K Wilmshurst), 1061
Origin of the Dwarf Coconut Palm Cytology and (Dr M S Swaminathan and M C Nambiar), 85
Origin of High Tritium Content of Atmospheric Methane, Hydrogen and Stratospheric Water (Dr Richard Wolfgang), 1279
Origin of Lunar Volcanoes Megashatter Cone Hypothesis of the (A J Cohen), 346
Origin of the Northern Rhodesian Copper Deposits, *review* by Prof J H Taylor, 98
Origin (Biological) Some Physico-Chemical Properties of Paracrystalline Spherulites of (Dr G T Stewart), 624
Origin (Possible), of the Use of Fire by Early Man (D C Arnold), 1318
Origins of Alcoholism (William McCord and Joan McCord, with Jon Gudeman), *review* by Dr W McAdam, 848
Ornamental Trees for Garden and Roadside Planting (S A Pearce), *review* by F P Knight, 852
Orosomucoid in Schizophrenia (Dr M Goodman, Prof E D Luby, Dr C E Frohman and Dr J S Gottlieb), 370
Orowan, Prof E (Argon, Dr A S, and) Lattice Rotation at Slip Band Intersections, 447
Orraca-Tetteh, Dr R The Better Use of the World's Fauna for Food (Habits, Collection and Utilization in the Diet of the Giant African Snail, *Achatina*), 1113
Osborne-White, W S (Smith, R M, and) Metabolism of Propionate by Homogenates of Normal Sheep Liver, 868
Oscillator (Two-level Maser) Detection of Spin Magnetization Variation in a (I M Firth and Dr D Bijl), 860
Oscillators (Classical) Fundamental Relaxation of (Michael Hoare), 63
Oscillatory Flow in an Air-filled Elastic System (Group-Capt J E Malcolm), 875
Osmaston, B B *Obituary*, 705
Osmotic Potential Importance of, as a Component of the Total Potential of the Soil Water on the Movement of Nematodes (C D Blake), 144
Osmotic Value in Pea Stem Sections Effect of Auxin on the (Shizuko Yoda and Joji Ashida), 577
Oster, Prof Gerald, and Broyde, Suse B Photochemical Properties of Water-soluble Chlorophyll, 132
Ostertagia spp in Sheep Effect of Whole-Body Irradiation and Cortisone on the Development of (J D Dunsmore), 139
Ostrow, J Donald, and others Enterohepatic Circulation of Bilirubin, 372
O'Sullivan, Dr D G, and Sadler, Dr P W Agents with High Activity against Type 2 Poliovirus, 341
Other Side of the Moon Atlas of the (edited by N P Barabashov, A A Mikhailov and Yu N Lipskiy), translated into English by Leon Ter-Oganian, *review* by Prof Zdenek Kopal, 839
Outer Atmospheric Asymmetry Confirmation of, postulated to explain the False Zodiacal Light (E R Hope), 742
Outer Space Fourth Colloquium on the Law of, 1244
Outline (An Electronic), of Organic Chemistry (Dr S Horwood Tucker), *review* by Dr Neville H P Smith, 7
Output (Cardiac) New Indirect Fick Procedure for the Determination of (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
Output (Faecal) A New Method of Estimating the Dry-Matter Intake of Grazing Sheep from their (J B Owen), 92
Ova and Serum Proteins (Hen Egg White, Oviduct White, Yolk,) Starch Gel Electrophoresis of (Dr F Steven), 972
Overbeek, Prof J T G Colloids (Drainage of Soap Films), 930
Overton, K H Lehrbuch der Organischen Chemie, *review*, 855
Overvoltage (Hydrogen), at Cathodes of 77 per cent Palladium and 23 per cent Rhodium (J C Barton and Dr F A Lewis), 549
Oviduct White, Yolk, Ova and Serum Proteins (Hen Egg White,) Starch Gel Electrophoresis of (Dr F Steven), 972
Oviposition (Inhibited), by Females of *Gryllus assimilis* (F), induced by Radioactive Males, using L-Methionine-Methyl-^{14}C (Dr A A Abdel-Malek and D K McE Kevan), 681
Owen, J B A New Method of Estimating the Dry-Matter Intake of Grazing Sheep from their Faecal Output, 92

Owen, Dr L N Title of professor of organic chemistry (at the Imperial College of Science and Technology, London) conferred on, 710
Owens, D R, and others Purification of Hydrogen Isotopes by Self-Displacement Chromatography at Low Temperatures, 1067
Owren, Prof P A, and others Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of Human Blood Platelets, 531
Ox Muscles Comparative *in vitro* Activities of Phosphorylase *b* and Cytochrome Oxidase in Preparations from Two (E J Briskey and R A Lawrie), 263
1,3,4-Oxadiazolones (New Tuberculostatic) Biological Spectrum of some, with special reference to Cross-Resistance and Rates of Emergence of Resistance (Prof A E Wilder Smith and Hans Brodhage), 1195
Oxfordshire (Berkshire, Buckingham and) Naturalists' Trust, Ltd Annual Report for 1960, 212
Oxidase (D-Amino-Acid) and 'Substrate-Substitute' Crystallization of the Complex of (Kunio Yagi and Takayuki Ozawa), 70
Oxidase (Cytochrome), in Preparations from Two Ox Muscles Comparative *in vitro* Activities of Phosphorylase *b* and (E J Briskey and R A Lawrie), 263
Oxidase (Cytochrome c), the Terminal Oxidase of *Iris pseudacorus* L (G G Henshaw, D A Coult and D Boulter), 579
Oxidase (Rat Liver Xanthine) Effect of Colchicine on (Dr Ottilia R Affonso, Emilio Mitidieri and Gilberto G Villela), 666
Oxidase (Terminal), of *Iris pseudacorus* L Cytochrome c Oxidase, the (G G Henshaw, D A Coult and D Boulter), 579
β Oxidase (Dopamine) Inhibition of, by Adrenalone (Prof M Goldstein and J F Contrera), 1081
Oxidase Activity in the Saliva of a Plant-Bug (P W Miles and Ann Helliwell) 374
Oxidation of Isocitrate and Metabolism of Fatty Acids in Rabbit-Heart Sarcosomes Relationship between (Dr W C Hulsmann), 1153
Oxidation (Carbon Monoxide) Radiation Effects on Lithium-doped Nickel Oxide Catalysts in (T Braun and I Maxim), 548
Oxidation (Glucose), in the Rat Lens Effect of Insulin on Pathways of (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075
Oxidation (Orcinol) Effect of Copper on Products of (Dr T F Slater), 420
Oxidation Processes in Chemical Manufacture (Society of Chemical Industry Symposium on), 1134
Oxidative Decarboxylation of Indole-3-acetic Acid by Mangani-Versene and by Wheat Leaf Enzyme (Prof R A Abramovitch and K S Ahmed), 259
Oxidative Enzyme Histo- and Cyto- Chemistry Use of Tetrazolium Compounds in (Prof C G Rosa and Kwan-Chung Tsou), 990
Oxidative Phosphorylation Detection of a Possible Intermediate in (Dr C H Suelter, M DeLuca, Dr J B Peter and Prof P D Boyer), 43
Oxide Bronzes Alkali Metal Titanium (A D Wadsley and Sten Andersson), 551
Oxide (Calcium) Electrical Conductivity of, at High Electric Fields (Dr C H B Mee), 350
Oxide (Cuprous), and Sodium Silicate A Coating with Antifouling Properties from the Reaction between (J R Rischbieth and F Marson), 748
Oxide (Magnesium) Production of 'Active', by Heating in Vacuum (R Valverde and J P Saenz), 653
Oxide (Nickel) Catalysts (Lithium-doped) Radiation Effects on, in Carbon Monoxide Oxidation (T Braun and I Maxim), 548
Oxide (Zinc) Thermal Decomposition of Ammonium Perchlorate in presence of (Dr F Solymosi and L Revész), 64
Oxide Medium (Deuterium) Effect of γ-Radiation on *Escherichia coli* grown in (Ernest Pollard), 177
Oxides of Nitrogen and Carbon Monoxide Amounts of in Cigarette Smoke, with and without Inhalation (C Bokhoven and H J Niessen), 458
Oxidized Cytochrome and Chlorophyll C_2^+ in Photosynthesis (Dr H T Witt, A Muller and B Rumberg), 967
Oxidized Flavour in Milk Hormonal Control of (Harald Astrup), 559
Oxygen Effect of Quinones on the Uptake of, by Red Cells (D Lovell and Dr T A J Prankerd), 561
  Electron-Spin Resonance Signals from Lyophilized Bacterial Cells exposed to (Dr M B Lion Dr J S Kirby-Smith and Dr M L Randolph), 34
Oxygen (Molecular) Incorporation of, during Microbial Utilization of Olefins (Tomoyuki Ishikura and J W Foster), 892
Oxygen-carrying Cobalt (II) Histidine Complex Structure of the (A Earnshaw and L F Larkworthy), 1068
Ozawa, Takayuki, (Yagi, Kunio, and) Crystallization of the Complex of D-Amino-Acid Oxidase and 'Substrate-Substitute', 70

PACE, J (McDermott, E E, and) Modification of the Properties of Flour Protein by Thiolated Gelatin 657

Paper Electrophoresis (L P Ribeiro, E Mitidieri and Dr O R Affonso), *review* by Dr G V F Seaman, 593
Papers (Filter), on Planchettes for Radioactive Counting A Simple Flattener for holding (Dr Edward A Smuckler and Prof Earl P Benditt), 191
Papers (Technical), of the Sandia Corporation, 1025
Papierchromatographie Handbuch der (herausgegeben von I M Hais und K Macek), Band 2 Bibliographie und Anwendungen, *review* by Dr R Consden, 1223
Papuans Glucose-6-Phosphate Dehydrogenase Activity in (Dr B P K Ryan and I C Parsons), 477
Paracrystalline Spherulites of Biological Origin Some Physico-Chemical Properties of (Dr G T Stewart), 624
Paradise (Tropical) Birds of, *review* by Dr L B Quesnel, 828
Paradoxical Effect of Phlorizin on Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Paramagnetic Ion Binding in Deoxyribonucleic Acid Solutions Relaxation Enhancement by (J Eisinger, R G Shulman and W E Blumberg), 963
Paramagnetic Resonance (Electron), and Antiferromagnetism in $LaCrO_3$ (L Weinberg and P Larssen), 445
Paranjpe, V N, and others Cotton in India, Vol 4, *review* by Prof S C Harland, 200
Parasite (Acanthocephalan), of the Eider Duck Life-Cycle of an (Dr C Rayski and E A Garden), 185
Parasites Human, *review* by Dr G Lapage, 197
Parasites of Man, *review* by Dr G Lapage, 488
  Introduction to Parasitology, with special reference to the (the late Prof Asa C Chandler and Prof Clark P Read), tenth edition, *review* by Dr G Lapage, 488
Parasites of World Importance (Parasitology Group of the Institute of Biology Autumn Meeting on), 21
Parasites (Animal), in Man (Dr N H Swellengrebel and M M Sterman), *review* by Dr G Lapage, 197
Parasites (Arthropod), of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol I, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
Parasites (Insect) Medicine and, *review* by Prof D S Bertram, 298
Parasitic Nematodes Precipitating Antibodies in the Carpet Snake against (H Timourian, C Dobson and J F A Sprent), 996
Parasitology Introduction to, with special reference to the Parasites of Man (the late Prof Asa C Chandler and Prof Clark P Read), tenth edition, *review* by Dr G Lapage, 488
Parasitology of Fishes (V A Dogiel, G K Petrushevski and Yu I Polyanski), translated by Dr Z Kabata, *review* by Dr Ben Dawes, 832
Parasitology (Russian) Ecological Branch of, *review* by Dr Ben Dawes, 832
Parcells, Dr Alan J Determination of the Amino-Acid Composition of Bovine Growth Hormone, 971
Pardoe, G K C Astronautics (Space Flight Projects based on *Blue Streak*), 312
  At the Twelfth International Astronautical Congress (Blue Streak as First Stage of a Satellite Launcher), 1245
Parikh, C B, and others Cotton in India, Vol 3, *review* by Prof S C Harland, 200
Paris Academy of Sciences Election of Prof N R Dhar as a corresponding member in the Chemistry Section, 1026
Parker, Dr A Biochemical Engineering, 120
Parkes, Prof P C Astronautics, 312
Parkinsonism Arrest of Acceleration of Speech evoked by Thalamic Stimulation in the Course of Stereotaxic Procedures for (Dr G Guiot, and collaborators), 921
Parks, J R (Clowes, Dr M B, and) At the twenty-seventh Conference of the International Federation for Documentation (A Device for the Automatic Identification of Printed Numerals), 219
Parliament Science in, 1129
Parotid Salivation in Sheep Effect of Urea Ingestion on (A D Wilson), 271
Parr, H C M, and Grose, J E H A Technique for Exposing Individual Flies on Insecticidal Deposits, 475
Parrish, E B The Better Use of the World's Fauna for Food (How to obtain Maximum Yield from Traditional Methods of Fishing), 1113
Parry, Gwyneth Chloride Regulation in *Triops*, 468
Parsons, I C (Ryan, Dr B P K and) Glucose-6-Phosphate Dehydrogenase Activity in Papuans, 477

Parsons Scholarship in Marine Engineering (1961) awarded by the Royal Institution of Naval Architects to Alan B Turner, 309
Partial Hydrolysis (Specific), of Nucleic Acids in Nucleotide Sequence Studies (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Participation of Imidazole in Intramolecular Hydrogen Bonding (Prof A Lukton), 422
Particle Accelerators Amsterdam Conference on, 123
Particle Involvement in Fatty Acid Synthesis in Liver and Yeast Systems (S Abraham, I L Chaikoff, W M Bortz, H P Klein and Halina Den), 1287
Particle Movement in Mature Sieve Tubes Transcellular Strands and (Dr R Thaine), 772
Particle-bound and Free Catecholamines in Dog Hearts and the Uptake of Injected Norepinephrine (A Wegmann and K Kako), 978
Particles (Fluorescent) Loss of, in Atmospheric Diffusion Experiments by Comparison with Radioxenon Tracer (A E J Eggleton and N Thompson), 935
Particles (Interplanetary Dust), in the Vicinity of Earth Direct Measurement of (C W McCracken, W M Alexander and M Dubin), 441
Particles (Sub-Cellular) Simplified Technique for Isolation of (Dr David W E Smith), 234
Particles (Sub-Cellular), isolated from the Hepatopancreas of *Carcinus maenas* Respiratory Chain Phosphorylation in (Dr R B Beechey), 975
Partington, Prof J R History of Chemistry, Vol 2, *correction of price*, 213
Partition Isotherms and Gas-Liquid Chromatography (G F Freeguard and R Stock), 257
Pascal Digital Computer (*Philips Technical Review*, Vol 23, No 1), 1024
Pascoe, J E Muscle Receptors (Pharmacological Studies of Spindles), 806
Pask, Gordon Teaching Machines (Principles of an Adaptive Teaching Machine), 106
Pasquill, F Medium Range Diffusion in the Atmosphere (Some Observed Properties of Medium-scale Diffusion in the Atmosphere), 13
Past Climates of the, *review* by Prof F W Shotton, 828
Past Experience of Rats Modification of the Effects of an Amphetamine–Barbiturate Mixture by the (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson), 533
Pate, Dr J S Perennial Nodules on Native Legumes in the British Isles, 376
  Temperature Characteristics of Bacterial Variation in Legume Symbiosis, 637
Patel, G B, and others Cotton in India, Vol 4, *review* by Prof S C Harland, 200
Pateman, J A Elected to a Fellowship at Churchill College, Cambridge, 710
Pathological Cerebrospinal Fluid (Normal and) Antithrombin Activity of (Dr H A Gaertner, J Lisiewicz and Dr J Caen), 1164
Pathological Human Gamma-Globulins Resolution of, by Starch-Gel Electrophoresis (J P Binette and K Schmid), 732
Pathways of Glucose Oxidation in the Rat Lens Effect of Insulin on (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075
Pathways (Mitochondrial) Transamination and the Control of (Dr H Gutfruend, Dr K E Ebner and L Mendiola), 820
Patients with Diabetes Mellitus Absorption and Excretion of Penicillin injected into the Muscles of (Dr L Weinstein and Dr R H Meade), 987
Patients with Essential Hypertension Prolonged Biological Half-Life of Sodium-22 in (Dr Lewis K Dahl, Malcolm G Smilay, Lawrence Silver and Sanford C Spraragen), 267
Patients (Heterozygous Carriers and), with Liver Glycogen Disease (Von Gierke's Disease) Blood Glucose-6-Phosphate in (Dr Joseph E Sokal, Sylvia Fleissner, Edward J Sarcione and Charles U Lowe), 265, (Dr David Yi-Yung Hsia), 266
Patients (Mental) Erythrocyte Cholinesterase-levels in (Dr George L Ellman and Dr Enoch Callaway), 1216
Paton, Prof W D M Chemistry in the Service of Medicine (Early History of Pharmacology), 1017
Patrick, Dr C R (Majer, Dr J R, and) Heat of Formation of the Difluoromethylene Radical, 866
Patterns (Circular Streaming), in a Slime-Mould Plasmodium (Dr Peter A Stewart and Dr Babette T Stewart), 1206
Pattison, Prof F L M, and Dear, R E A Synthesis of the Toxic Principles of *Dichapetalum toxicarium* (18-Fluoro-*cis*-9-Octadecenoic Acid), 1284
Patton, S Microchemical Techniques (Identification of Food Flavours using Gas, Paper and Column Chromatography, and the Study of the Dinitrophenyl-hydrazones of Volatile Keto-Compounds), 412
Paul, Dr John (McCallum, H Morag, and) Lathyrogenic Activity *in vitro*, 273
Paul Instrument Fund Grant of £44,500 to Dr V E Cosslett, to design and construct a very high voltage electron microscope and to explore its applications in biological and metallurgical research, 708
  Grant of £1,000 (in supplement of a previous grant), to Prof D Gabor and Dr D Jones, for work on the development of an electron interference microscope, 708
  Grant of £3,500 to D W Hill, for the construction of an infra-red gas or vapour analyser using interference filters, 708
  Grant of £2,500 to Dr N Kurti, for the construction of a nuclear thermometer for use in the micro-degree Kelvin temperature-range, 708
  Grant of £1,500 (in supplement of a previous grant), to Dr J H Sanders, for the construction of an optical maser, 708
Pauling, Dr Peter, and others Eight-Co-ordinate Diarsine Complexes of Quadrivalent Metal Halides, 222
Pauson, Prof P L Colloids, 929
Payne, C G Colour and Density of Light and Broiler Performance, 769
Pea Stem Sections Effect of Auxin on the Osmotic Value in (Shizuko Yoda and Joji Ashida), 577
Peaceful Uses Applications of Science to, *review* by R. Brightman, 850
Peacock, D B Appointed lecturer in bacteriology at the University of Bristol, 710
Peacock, Dr N J Spectroscopic Studies using Time-Resolved Techniques (Spectroscopic Work on the Fast Pinch Discharges at the Atomic Weapons Research Establishment Plasma Group at Aldermaston), 1033
Peacocke, Dr A R, and Preston, Dr B N Effect of Gamma-Rays on Thymus Nucleoprotein in Solution, 228
Peak Areas in Gas–Liquid Chromatography Quantitative Estimation of (J Dijkstra), 965, (Prof K K Carroll), 965
Pearce, S A Ornamental Trees for Garden and Roadside Planting, *review* by F P Knight, 852
Pearson J E, and Jane, J A Microwave Measurement Techniques (Need for Power Density Monitors to measure Power Densities of the order of 1-20 mW/cm^2 for Health Hazard Purposes), 409
Pearson W B (Mooser, E, and) Ionic-Covalent Bonding in Crystals, 355
Peas (Meteor) Gibberellic Acid and Chlorophyll Content of Leaves of (P Bishop and Prof C P Whittingham), 576
Pease, Daniel C Histological Techniques for Electron Microscopy, *review* by Dr V E Cosslett, 5
Peate, Dr Iorwerth C Elected president of the Society for Folk-Life Studies, 19
Peavler, R J (Ananthanarayanan, Prof N I, and) A New Reversible Solid-State Transformation in Iron–Nickel Alloys in the Invar Range of Compositions, 962
Pedler, Dr A E Appointed to a senior Research Fellowship in the Department of Chemistry in the University of Birmingham, 406
Peeling, Dr E R A Appointed senior lecturer in chemistry at the University of Sussex, 1241
Pegmatitic Carbonatite in a Syenite–Marble Contact Formation of (R D Schuiling), 1280
Peguy, Prof Ch P Precis de Climatologie, *review* by Prof W B Fisher, 1223
Peirson, D H Transfer of Stratospheric Fission Products into the Troposphere, 497
Pell, E (Malissa, H, and) Microchemical Techniques (Complete Automation of the Micro-determination of Carbon, Hydrogen and Sulphur), 411
Pellet, P L, and Millar, D S The Better Use of the World's Fauna for Food (Processing and Preservation of Meat in Under-developed Areas), 1113
Penczak, Tadeusz Serological Relationships between the Nine-spined and the Three-spined Stickleback, 673
Penetration of Spines from a Marine Diatom into the Gill Tissue of Lingcod (*Ophiodon elongatus*), (Dr Gordon R Bell), 279
Penfold, A R and Willis, J L The Eucalypts—Botany, Cultivation, Chemistry and Utilization, *review* by T A Russell, 488
D-Penicillamine as an Antidote to 8-Hydroxyquinoline and Alloxan (Makoto Matsuda and Prof Katashi Makino), 261
Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of (Dr J J Saukkonen), 816
  Antigenicity of, and its relation to Albumin Binding (Dr Toshio Torii and Dr Yoshihi Kohoriuchi), 429
  Spheroplasts of Marine Bacteria induced by the Action of (J R Boring and Prof D Pratt), 773
Penicillin injected into the Muscles of Patients with Diabetes Mellitus Absorption and Excretion of (Dr L Weinberg and Dr R H Meade), 987
Penicillinase New Penicillins Stable towards both Acid and (F P Doyle, A A W Long, J H C Nayler and E R Stove), 1183
Penicillins (New) Survey of (Prof Robert Knox), 492
Penicillins (New), Stable towards both Acid and Penicillinase (F P Doyle A A W Long, J H C Nayler and E R Stove), 1183
Pennella, P, and others Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall, 552
Pennington, Dr R J 5′-Adenylic Acid Deaminase in Dystrophic Mouse Muscle, 884
People Priests and (Dr Conor K Ward), *review* by the Rev J Robinson, 102
People (Heat-acclimatized) Heart-rates and the Sub-lingual Temperatures of (Dr G C Whittow), 1086
Peptidase Activity (α-Glutamyl) Histochemical Characterization of a Unique (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices) (George G Glenner and John E Folk), 339
Peptidases (Glutamyl), in Rat and Guinea Pig Kidney Slices (George G Glenner and John E Folk)—Histochemical Demonstration of γ-Glutamyl Transpeptidase-like Activity, 338, Histochemical Characterization of a Unique α-Glutamyl Peptidase Activity, 339
Peptides released by Digestion with Chymotrypsin (Amino-Acid Sequence of Horse Heart Cytochrome c), (Dr E Margoliash and Prof Emil L Smith), 1121
Peptides, Terminal and Internal, released by Digestion with Trypsin (Amino-Acid Sequence of Horse Heart Cytochrome c), (Dr G Kreil and Prof H Tuppy), 1123
Peptides (Low Molecular Weight) Separation of, from Amino-Acids on 'DEAE-Sephadex' (P R Carnegie), 658
Perception Sensation and (D W Hamlyn), *review* by F I G Rawlins, 593
Perception (Extra-Sensory) A Survey of, *review* by Dr E J Dingwall, 4
Perchlorate (Ammonium) Thermal Decomposition of, in presence of Zinc Oxide (Dr F Solymosi and L Révesz), 64
Perchloric Acid–Naphthoquinone Method for the Histochemical Localization of Cholesterol (Dr C W M Adams), 331
Perel'man, A I Geochemical Landscapes, 114
Perennial Nodules on Native Legumes in the British Isles (Dr J S Pate), 376
Pérès, Prof J Appointed president for 1962 of the International Astronautical Congress, 1244
Performance (Broiler) Colour and Density of Light and (C G Payne), 769
Pericardial (Intra-) Hepatic Intrusion in the Common Dogfish (Dr A S Fuller), 280
Periodic Acid–Schiff Technique Limitations of the, for the Demonstration of Stages of *Eimeria* in Tissues (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Periodic Acid–Schiff Technique for the Demonstration of Extra- and Intracellular Stages of Gregarine and Coccidian Protozoa (Dr J B Jennings), 473
Periodicities Sun–Earth Relations and associated (Irvine Paghis), 346
Peripheral Blood Chromosome Preparations obtained directly from (M A Kinlough and Prof H N Robson), 684

Periplaneta Substances controlling the Rate of Beating of the Heart of (K G Davey), 284
Perkin Centenary Fellowship (Perkin Centenary Trust), 506
Perkin Centenary Trust Awards of the Perkin Centenary Fellowship and Perkin Fellowship Scholarships, 506
Perkin Centenary Scholarships (Perkin Centenary Trust), 506
Permafrost in the Mackenzie River Delta Effect of a Lake on Distribution of (G H Johnston and R J E Brown), 251
Permeability of *Lactobacillus plantarum* Alteration of, caused by Chlorpromazine (Dr Helene A Nathan), 471
Permeability of the Mammary Gland to Sodium-24, Potassium-42, Chlorine-36 and Iodine-131 (P -G Knutsson), 977
Permeability of the Synovial Membrane to Glycoproteins (Lars Sundblad, Dr Eric Jonsson and Erik Nelletbladt), 1192
Peroxidase Interaction of ^{14}C-Œstrone with Tryptophan in the Presence of (Dr P H Jellinck and Louise Irwin), 660
Peroxidase in Pig Thyroid Gland Demonstration and some Properties of (Toichiro Hosoya and Nobuo Ui), 659
Peroxidase Activity Relationship between Tissue Eosinophils and (Tapio Rytomaa and Prof Harald Teir), 271
Peroxidase and Methaemalbumin Haemin–Protein Binding in (Dr A C Maehly), 630
Peroxide-like Substance in Alarmed Mice (V J Horgan and J St L Philpot), 662
Perry, Byrne, and others Simulated Wave-Riding Dolphins, 148
Perry, Frances Water Gardening, third edition, *review* by Dr G Taylor, 392
Persistence of Motility in Bone-Marrow Cells from the Cadaver (Dr I B Porteous), 569
Persistence of Sterols other than Cholesterol in Chicken Tissues (David Kritchevsky and Vittorio Defendi), 71
Persistent Vaginal Œstrus Luteinizing Hormone in (Dr G P van Rees and Dr J J van der Werff ten Bosch), 876
Personnel Management, Institute of Personnel Management Salaries—Report of a Survey undertaken in February–March, 1961, 506
  Annual Report for 1960-61, 1024
Personnel Management Salaries—Report of a Survey undertaken in February–March 1961 (Institute of Personnel Management), 506
Persons acclimatized to Heat Flow of Blood in the Forearm of (Dr G C Whittow), 759
Peru Orchids of (Charles Schweinfurth), 719
Peru (Southern) Epidemiological Surveys on Chagas' Disease in the Village of Matalaque (Felix Naquira, Eleazar Cordova, Cesar Naquira and Enrique Rubin de Celia), 921
  Incidence of Chagas' Disease in the Matalaque Region (Eleazar Cordova), 921
Peruvian Indians Haptoglobin and Transferrin Types in (Dr Eloise R Giblett and Dr William R Best), 1300
Peruvian Orchids (V S Summerhayes), 719
Pests and Diseases (Plant) Chemical Warfare on (W C Moore), 1140
Petch, Prof N J Metallurgy of Beryllium, 1137
Peter, Dr J B , and others Detection of a Possible Intermediate in Oxidative Phosphorylation, 43
Peters, Prof B G Nematology at the Imperial College of Science and Technology, London, 1027
Peterson, G H (McLaren, Prof A D , and) Montmorillonite as a Caliper for the Size of Protein Molecules, 960
Pethiyagoda, U Effect of Charcoal on the Behaviour of Adenine Nucleotides in Ion-Exchange Chromatography, 452
Petioles (Rhubarb) Auxin Activity in Ether-insoluble Fractions of Extracts of (B E S Gunning), 661
Petraitis, Ruth, and others Ultrastructural Alterations during the Crabtree Effect in Rous Sarcoma Cells, 1271
Petroleum, Institute of (Gas Chromatography Discussion Group) Symposium on Gas Chromatography in Medical Research, 717
Petrov, R V , and others Problems of Infection, Immunity and Allergy in Acute Radiation Diseases (translated from the Russian by Lydia Venters , edited by R Clarke), *review* by Dr Hugh D Evans, 6
Petrucci, Dr D Producing Transplantable Human Tissue in the Laboratory, 21
Petrushevski, G K , and others Parasitology of Fishes (translated by Dr Z Kabata), *review* by Dr Ben Dawes, 832
Petten Research Centre of the Reactor Centrum Nederland High-flux Reactor at the, 708
*p*H and Urea Influence of, on the Ultra-violet Fluorescence of several Globular Proteins (Dr R F Steiner and H Edelhoch), 873
Phage Type and Host Plant Relationship between, in *Pseudomonas mors-prunorum* Wormald (J E Crosse and Constance M E Garrett), 379
Phagocytosis Biochemical Aspects of (Dr G H N Iyer, Dr M F Islam and Prof J H Quastel), 535
  Effect of, on the Lysis of *Staphylococcus aureus* (Type 81) by Bacteriophage (Dr J M McKenna and R P Sanderson), 570
Pharmaceutical Conference (British) Election of J C Hanbury as chairman for 1961-62, 21
  Chairman's Address (Dr D C Garratt), 122
Pharmaceutical Control in Britain (Dr D C Garratt), 122
Pharmaceutical Journal Appointment of R Blyth as editor, 609
Pharmaceutical Services The British National Health Service, a Short Survey with particular reference to the (Pharmaceutical Society of Great Britain), 801
Pharmaceutical Society of Great Britain The British National Health Service, a Short Survey with particular reference to the Pharmaceutical Services, 801
Pharmaceutical and Allied Research Laboratories Radioactivity for—a Symposium sponsored by Nuclear Sciences and Engineering Corporation (edited by Abraham Edelmann), *review* by Dr Hugh D Evans 6
Pharmacohynamical Effects of Asarone and β-Asarone (J D Sharma, Dr P C Dandiya, Dr R M Baxter and Dr S I Kandel), 1299
Pharmacology at St Bartholomew's Hospital Medical College, London, 210
Pharmacy (Medicine and) Second British Congress on the History of (Chemistry in the Service of Medicine), (Worshipful Society of Apothecaries of London, in co-operation with the Chemical Society), 1017
  Third British Congress on the History of (The History of British Hospitals), 1241
Phase (Explosive), of Solar Flares Coincidence of the, with 10 7 cm Solar Noise Bursts (Arthur E Covington and Gladys A Harvey), 152
Phase (Sexual), in the Life-Cycle of an Amoeba Evidence for a (M R Droop), 281, *erratum*, 507
Phases in Evolution *review* by Dr L R Cox, 3
Phases of Growth of Algerian Ivy Effect of Temperature and Potassium Gibberellate on (J R Goodin and Prof V T Stoutemyer), 677
Phases (α-Manganese), containing Technetium-99 (D J Lam, J B Darby, jun , J W Downey and L J Norton), 744
R-Phases (New Ternary), with Silicon (D I Bardos, K P Gupta and Prof Paul A Beck), 744
1,10-Phenanthroline and 2,2'-Bipyridyl Five-Covalent Copper(II) Complexes containing (Properties of some Copper Complexes), (Dr C M Harris, T N Lockyer and Hanneke Waterman), 424
Phenazone and Amidopyrine Anti-Asthmatic Effect of (H Herxheimer and E Stresemann), 1089
Phenol Use of, in Determining Chromatographic Purity (B H Koeppen), 360
  Use of, in the Isolation of Erythropoietic Glycoprotein (Peter H Lowy and Geoffrey Keighley), 75
Phenol-treated *Escherichia coli* on Membrane Filters Influence of Adding Salts to the Medium on Counts of (N D Harris and J P Richards), 87
Phenolic (Plant) Substances Biochemistry of (Plant Phenolics Group of North America Symposium on), 418
Phenolics (Plant) Group Symposium on Wood Extractives, 511
Phenolics (Plant) Group of North America Inaugural Meeting, 418
  Symposium on the Biochemistry of Plant Phenolic Substances, 418
  Election of Officers, 418
Phenomena (Inhibitory), and 'Habituation' at the Neuronal Level (B Holmgren and S Frenk), 1294
Phenomenon (Triple Resonance), in Plasmas (T J Bellanca, Prof R S Elliott and J J Erlinger), 543
Phenotype (A Rare), within the *Cm* System (K Henningsen and Jørgen C Nielsen), 476
Phenylalanine as Inhibitor of Transport of Amino-Acids in Brain (K D Neame), 173
2-Phenylazulene Crystal Structure of (Prof B D Sharma and J Donohue), 863
Philips Technical Review Vol 23, No 1, 1025
Phillips, Prof A W , and others Serotonin in the Small Intestine of Conventional and Germ-free Chicks, 380
Phillips, C K Elected to a Fellowship at Churchill College, Cambridge, 710
Phillips, Dr I D J Induction of a Light Requirement for the Germination of Lettuce Seed by Naringenin, and its Removal by Gibberellic Acid, 240
Phillips, Dr J G Endocrinology and Evolution (The Adrenal Gland), 797
Phillips, Dr T R Gas Chromatography in Medical Research, 718
Phillips, Dr T R , and others Purification of Hydrogen Isotopes by Self-Displacement Chromatography at Low Temperatures, 1067
Philosophical Society (American) Memoirs, Vol 51, Population Redistribution and Economic Growth, United States, 1870-1950 (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grebenik, 853
Philosophical Transactions of the Royal Society (Dr W P D Wightman), 23 , (Dr O M Lidwell), 584
Philosophy Evolution of Regeneration, and its Possible Bearing on (Dr R J Spilsbury), 1254 , (Dr A E Needham), 1255
Philosophy of Science (B C Brookes), 508
Philosophy of Science British Society for the Sixth Annual Conference, 508
Philp, J McL , and others Toxicity associated with certain Samples of Groundnuts, 1095
Philpot, J St L (Barnes, J H , and) Protection by Inorganic Condensed Phosphates against the Lethal Effects of X-Rays, 574
Philpot, J St L (Horgan, V J , and) Peroxide-like Substance in Alarmed Mice, 662
Phisitians' 'Opinions of the Late and Best, *review* by Kenneth Bloor, 848
Phlorizin Paradoxical Effect of, on Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Phosphatase (A Zinc-requiring Alkaline), in the Ventral Lobe of the Rat Prostate (Leonora Hopkinson and J C N Wakeley), 357
Phosphates (Adenine and Adenosine) Demonstration of Interaction Products of, with Formaldehyde (Dr D L Woodhouse), 336
Phosphates (Inorganic Condensed) Protection by, against the Lethal Effects of X-Rays (J H Barnes and J St L Philpot), 574
Phospholipase *A* Inactivation of Rous Virus by (H A Drayton), 896
Phospholipid of Neoplastic Tissue (Oncolipin) Interaction between Lysozyme and a (R Ferrari and S Matracia), 1187
Phospholipid Factor Effect of a, on the Activity of Progesterone (Effect of Progesterone on Pregnancy), (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
Phospholipids A Correlation between Surface Charge and Coagulant Action of (Dr A D Bangham), 1197
Phospholipids and Sulpholipids (Biochemical Society and the British Biophysical Society Joint Discussion on), 807
Phosphonic (Alkyl), and Alkyl Phosphonothionic Acids Hydrogen Bonding in (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Phosphonothionic (Alkyl Phosphonic and Alkyl) Acids Hydrogen Bonding in (L C Thomas, Rosemary A Chittenden and H E R Hartley), 1283
Phosphoproteins from Plasma of the Laying Hen Phosphorylserine as a Constituent of (P J Heald), 455
Phosphorus Metabolism in the *Avena* Coleoptile Effect of Indole-3-Acetic Acid (IAA) on (A Sen Gupta and S P Sen), 1291
Phosphorus (Radioactive) Specificity of Plant Feeding in Mosquitoes as determined by (Dr A A Abdel-Malek and Dr W F Baldwin), 178
Phosphorus-32 (Incorporation of), into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays Effects of Iodoacetic Acid on the (Dr M Quintiliani, M Boccacci and L Tentori), 573
Phosphorus-32 Mononucleotide Labelling of the Isolated Rat Diaphragm in the Controlled Absence of Extracellular Glucose Effect of Insulin on the (P Volfin, D Eboue and H Clauser), 166
Phosphorylase *b* and Cytochrome Oxidase in Preparations from Two Ox Muscles Comparative *in vitro* Activities of (E J. Briskey and R A Lawrie) 263

Phosphorylation (Oxidative) Detection of a Possible Intermediate in (Dr C H Suelter, M DeLuca, Dr J B Peter and Prof P D Boyer), 43
Phosphorylation (Respiratory Chain), in Sub-Cellular Particles isolated from the Hepatopancreas of *Carcinus maenas* (Dr R B Beechey), 975
Phosphorylserine as a Constituent of Phosphoproteins from Plasma of the Laying Hen (P J Heald), 455
Photo-Association of Aromatic Hydrocarbons in Fluid Media Evidence for the (Dr B Stevens), 725
Photochemical Products (Atmospheric) ('Smog') Interaction of Light and, within Plants (O C Taylor, W M Dugger, jun , E A Cardiff and E F Darley), 814
Photochemical Properties of Water-soluble Chlorophyll (Prof Gerald Oster and Suse B Broyde), 132
Photochemistry Atmospheric (Sir Harrie Massey and Dr A E Potter), 213
Photoelectric Spectrophotometry Modified Cuvettes for (Dr Malcolm H Smith), 722
Photoisopyrocalciferol Space Group and Unit Cell of the *m*-Bromobenzoate of (Prof G L Hardgrove) 551
Photometric Standards and the Unit of Light (J S Preston), (National Physical Laboratory, Notes on Applied Science No 24), 1250
Photo-Reactivation of Tobacco Mosaic Virus *in vivo* (D J Goodchild), 289
Photosynthesis Oxidized Cytochrome and Chlorophyll C_2^+ in (Dr H T Witt, A Muller and B Rumberg), 967
  Thermal Reaction between Two Light Reactions in (Prof C P Whittingham and P M Bishop), 426
Phyllochaetopterus claparedii McIntosh in the North-east Pacific Occurrence of (R Phillips Dales), 1208
Phyllody Virus (Clover) Transmission of, by *Aphrodes bicinctus* (Schrank) in North America (Dr L N Chiykowski), 581
Physical Chemistry Fast Reactions in (Dr W Gerrard), 1136
Physical Conditions as Important Factors for the Regeneration of Naked Yeast Protoplasts (Dr O Nečas), 580
Physical Gas Dynamics (edited by A S Predvoditelev), translated from the Russian by Dr R C Murray and D R H Phillips, *review* by Dr I S Donaldson, 837
Physical Geography of Asiatic Russia (S P Suslov), translated from the Russian by Noah D Gershevsky , edited by Joseph E Williams, *review* by Prof S I Tomkeieff 200
Physical Laboratory (Dominion), New Zealand Informal Symposium on Quantitative Biology, 25
Physical Methods in Chemical Analysis (edited by Walter G Berl), Vol I, second edition, *review* by Dr D T Lewis, 391
Physical Oceanography (Prof Albert Defant), *review* by Dr J C Swallow, 101
Physical Science Study Committee Laboratory Guide for Physics, *review* by G R Noakes, 99
  Physics, *review* by G R Noakes, 99
Physical Sciences from the Earliest Times to the Present The Search for Order—the Development of the Major Ideas in the (Cecil J Schneer), *review* by Prof Herbert Dingle, 901
Physical Society (Institute of Physics and the) Conference on Spectroscopic Studies using Time-Resolved Techniques, 1032
Physical Society (Netherlands), and the *Groupement Ampere* International Conference on Magnetic and Electric Resonance and Relaxation, 213
Physicians of Philadelphia, College of Alvarenga Prize awarded to Prof Seymour S Kety, 21
Physico-Chemical Properties of Paracrystalline Spherulites of Biological Origin Some (Dr G T Stewart), 624
Physics (Physical Science Study Committee), *review* by G R Noakes, 99
  Cosmic Ray (Latin-American Council for Cosmic Ray Research Third Latin-American Conference and Course on), 121
  Laboratory Guide for (Physical Science Study Committee), *review* by G R Noakes, 99
  Modern (M S Smith), *review* by Prof H Lipson, 854
  Nobel Prize for, awarded to Prof Robert Hofstadter and Prof R L Mossbauer, 799
  Plasma (Danish Atomic Energy Commission Research Establishment, Report No 18), 1025
  Research and Education in (International Atomic Energy Agency, Unesco and the Central Committee for Swedish Technical Assistance International Seminar on), 709
  Theoretical and Experimental (Dr H G Jerrard and Dr D B McNeill), *review* by D H Trevena, 491
Physics, Institute of, and the Physical Society Conference on Spectroscopic Studies using Time-Resolved Techniques, 1032
Physics, American Institute of John T Tate Medal awarded to Dr P Rosbaud, 112
Physics Text-Books A New Look in, *review* by G R Noakes, 99
Physics (Atmospheric and Terrestrial), Journal of Special Supplement No 7, Vistas in Astronomy (edited by Arthur Beer), Vol 3, Part I, Dynamics, Geophysics, Instruments, Solar System , Vol 3, Part 2, Stellar Astronomy, Stellar Evolution, Photometry, Galaxies, Spectroscopy, Cosmology, *review* by Dr A Danjon, 838
Physics (Electrical Engineering or) Research Scholarships in (British Broadcasting Corporation), 115
Physics (Experimental), at the University of Sussex, 707
Physics (High Energy) Proceedings of the 1960 Annual International Conference on (Rochester, 1960), (edited by E C G Sudarshan, J H Tinlot and A C Melissinos), *review* by Dr G H Stafford, 7
Physics (Nuclear) Accelerators for Low-Energy, 1239
  Rutherford Jubilee International Conference on (Dr A Herzenberg), 794
Physics (Theoretical), in the University of Sussex, 504
Physics and Electronics The International Dictionary of, second edition, *review* by J R Tillman, 1111
Physiological (High and) Salt Concentrations Antigen–Antibody Precipitation contrasted in Gels of (Dr Alfred J Crowle and David C Lueker), 50
Physiology Nobel Prize for, awarded to Dr Georg von Bekésy, 800
Physiology (Plant Eco-) Methodology of (Botanical Institute, Montpellier, Symposium on), 1241
Phytophthora palmivora (Butl) Butl Probable Mechanism of Resistance of Varieties of Cocoa to Black Rod Disease caused by (Dr John A Spence), 278
Pickard, Dr O G Education and Training on the Continent of Europe, 719
Pickles, Sir John Presidential Address at the British Electrical Power Convention (Electricity in the Prosperity and Welfare of the Nation), 500
Pig Thyroid Gland Demonstration and some Properties of Peroxidase in (Toichiro Hosoya and Nobuo Ui), 659
Pigeon Liver Inactivation of *A*-Methopterin by the Acetylating Enzyme System from (V Krishnamurthy and Beatriz M Braganca), 68
Pilot Plants in Metallurgical Research and Development Symposium on, held at the National Metallurgical Laboratory, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Pimento Incipient Dioecy in (G P Chapman and S K Glasgow), 1205
Pinus banksiana Influence of Date of Flushing on Flowering in (Philip R Larson), 82
Pioneers of Underwater Sound Award of the Acoustical Society of America presented to Dr Albert B Wood, 507, 710
Pituitary Effect on Synthesis of Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Pituitary Extract (Sheep) Effect of on Hypercholesterolaemia in Intact and Hypophysectomized Rats (Dr Russel M Barakat), 71
Pituitary Gonadotrophic Function Non-steroid Inhibitors of (G E Paget, A L Walpole and D N Richardson), 1191
Pituitary Lobe (Anterior), of the Male Rat at various Ages Growth Hormone Activity of the (R H Bowman), 976
Pituitary Tumours (Mouse) Difference in Metabolism of Labelled Thyroxine between Thyrotropic and Adrenotropic (Dr Sidney C Werner, Eugene M Volpart and Raul Grinberg), 1193
Placenta (Human), and Kidney Closely Related Antigens in (Dr Raymond William Steblay), 1259
Planchettes A Simple Flattener for holding Filter Papers on, for Radioactive Counting (Dr Edward A Smuckler and Prof Earl P Benditt), 191
Planetary Atmosphere with Rayleigh Scattering Tables related to Radiation emerging from a (Kinsell L Coulson, Jitendra V Dave and Zdenek Sekera), *review* by Prof Zdeněk Kopal, 1005
Plankton on the North Kenya Banks (J Wickstead), 890
Plankton (Fossil Micro-) Classification of (Dr C Downie, G L Williams and Dr W A S Sarjeant), 471
Planned Procrastination Occupational Versatility and (Prof Alec Rodger), 607
Planning of Helicopter Stations in the London Area (Report of the Ministry of Aviation Committee on the), 29
Plant Cells Electrolytes and (Prof G E Briggs, Dr A B Hope and Prof R N Robertson), *review* by Dr James F Sutcliffe, 831
Plant Eco-Physiology Methodology of (Botanical Institute, Montpellier, Symposium on), 1241
Plant Feeding in Mosquitoes Specificity of, as determined by Radioactive Phosphorus (Dr A A Abdel-Malek and Dr W F Baldwin), 178
Plant Growth Compounds Effect of, on Uptake of Amino-Acids by Plant Roots (D E Wright), 1044
Plant-Growth Inhibitor (A Potent, Non-Toxic), from an Antibiotic Fermentation (Dr L G Nickell and W D Celmer), 1098
Plant Pests and Diseases Chemical Warfare on (W C Moore), 1140
Plant Phenolic Substances Biochemistry of (Plant Phenolics Group of North America Symposium on), 418
Plant Phenolics Group Symposium on Wood Extractives, 511
Plant Phenolics Group of North America Inaugural Meeting, 418
  Symposium on the Biochemistry of Plant Phenolic Substances, 418
  Election of Officers, 418
Plant Roots Effect of Plant Growth Compounds on Uptake of Amino-Acids by (D E Wright), 1044
Plant Stem Structure of the, in relation to Adventitious Rooting (A Beryl Beakbane), 954
Plant Virology Accumulation of Asparagine in Maize Plants infected by Maize Rough Dwarf Virus and its Significance in (Dr I Harpaz and S W Applebaum), 780
Plant (Host) Relationship between Phage Type and, in *Pseudomonas morsprunorum* Wormald (J E Crosse and Constance M E Garrett), 379
Plant-Bug Oxidase Activity in the Saliva of a (P W Miles and Ann Helliwell), 374
Plant Œstrogen Biochanin *A* in the Rat Demethylation of the (Anna Nilsson), 358
Plantes utiles du Gabon (André Raponda-Walker et Roger Sillans), *review* by T A Russell, 693
Planting (Roadside) Ornamental Trees for Garden and (S A Pearce), *review* by F P Knight, 852
Plants The Growing Tip of, *review* by Dr A Allsopp, 830
  Interaction of Light and Atmospheric Photochemical Products ('Smog') within (O C Taylor, W M Dugger jun , E A Cardiff and E F Darley), 814
  Œstrogen Content of, as a Function of Conditions of Culture (Prof R Ferrando, M M Guilleux and A Guerrillot-Vinet), 1205
  Translocated Heat Injury in (Prof C E Yarwood), 887
Plants (Higher and Lower), and their related Uronic Acid Contents Cation-Exchange capacities of Tissues of (A H Knight, W M Crooke and R H E Inkson), 142
Plants (Lower Archegoniate) Growth and Development of the (Linnean Society of London International Symposium on), 710
Plants (Maize), infected by Maize Rough Dwarf Virus Accumulation of Asparagine in, and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
Plants (Pilot), in Metallurgical Research and Development Symposium on, held at the National Metallurgical Laboratory, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Plants (Tropical) Research with, 418
Plants (Woody), of Ghana with special reference to their Uses (Dr R F Irvine), *review* by W D Clayton, 695
Plasma of the Laying Hen Phosphorylserine as a Constituent of Phosphoproteins from (P J Heald) 455
Plasma (Blood) A Micromethod for the Determination of Bradykininogen in (Dr Carlos R Diniz, Ivan F Carvalho, J Ryan and M Rocha e Silva), 1194
Plasma (Human) Isolation of an α_2-Globulin from (Dr M Steinbuch and Dr J Loeb), 1196
  Role of Hageman Factor in the Activation of Vasodilator Activity in (Dr M E Webster and O D Ratnoff), 180

Plasma Albumin Catabolism in Experimental Nephrosis (Dr Alvin L Sellers, Joseph Katz and Sheldon Rosenfeld), 562
Plasma Iron and Iron-binding Capacity in the Pregnant Rat and Rabbit (E H Morgan), 461
Plasma Membrane 'Glycerol Effect' and the Mechanism linking Excitation of the, with Contraction (Prof Masahiro Fujino, Toshio Yamaguchi and Keishi Suzuki), 1159
Plasma Physics (Danish Atomic Energy Commission Research Establishment, Report No 18), 1025
Plasmas Triple Resonance Phenomenon in (T J Bellanca, Prof R S Elliott and J J Erlinger), 543
Plasmodium (Slime-Mould) Circular Streaming Patterns in a (Dr Peter A Stewart and Dr Babette T Stewart), 1206
Plastics Centenary of (1862-1962), 505
  Fellowships in Engineering Study and Fundamental Research in (Princeton University), 921
Plastics Federation (British), (Plastics Institute and the) Joint Committee to organise events in connexion with a Centenary of Plastics 1862-1962, 505
Plastics Institute and the British Plastics Federation Joint Committee to organize events in connexion with a Centenary of Plastics 1862-1962, 505
Platelets (Human Blood) Adenosine Diphosphate in Red Cells as a Factor in the Adhesiveness of (A Gaarder, Dr J Jonsen, Prof S Laland, Dr A Hellem and Prof P A Owren), 531
Plates (Ice) Formation of Cracks in, by Thermal Shock (L W Gold), 130
Platinum–Alumina Catalysts Valence State of (R J Bertolacini), 1179
Playfair, J H L, and others P_1 Antigen in the Human Foetus, 883
Pleistocene and Holocene Deposits in the Haua Fteah Absolute Age of (Dr C B M McBurney), 685
Podzimek, J, and others Systematic Measurement of Fall-out in Czechoslovakia up to 1961, 398
Poetry and Verse Science in, *review* by T R Henn, 98
Poisner, A M (Douglas, Prof W W, and) Stimulation of Uptake of Calcium-45 in the Adrenal Gland by Acetylcholine, 1299
Polarization (Anode Concentration) Evaluation of Boundary Layer Thickness in Electrolytic Systems from Decay of (Leonard Nanis), 449
Polarized Thermal Emission from Narrow Tungsten Filaments (Prof Yngve Öhman) 254
Polarographical Reduction of some Carbonyl Compounds Role of Keto-Enol Tautomerism in the (Dr P Zuman and Dr J Michl) 655
Polarography Recent Developments in (Dr G W C Milner), 213
Poliovirus (Type 2) Agents with High Activity against (Dr D G O'Sullivan and Dr P W Sadler), 341
Polish Academy of Sciences *Review* of the, Vol 6, No 1 January–March, 801
Political and Economic Planning Annual Report for 1960-61, 307
Politics and Education in Ghana, 1219
Pollard, Ernest Effect of γ-Radiation on *Escherichia coli* grown in Deuterium Oxide Medium, 177
Pollen and Stigmas Influence of the Age of, on Sex Determination in Hemp (Regina Laskowska), 147
Pollution (Oil), of Marine Organisms (Dr M George), 1209
Pollution (Water) Research in Great Britain (F E Bruce), 711
Poly-L-Tryptophan Examinations of Side-Chain Interactions in (Sidney Shifrin), 751
Polyanski, Yu I, and others Parasitology of Fishes (translated by Dr Z Kabata), *review* by Dr Ben Dawes, 832
Polychaete *Fabricia sabella* (Ehr) Development of the (D B Lewis), 80
Polyethylene Glycol and Dyes Behaviour of Protozoa under the Influence of the Synergetic Action of (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Polymer Chemistry, *review* by Dr I C McNeill, 490, 591
  Preparative Methods of (Wayne R Sorenson and Tod W Campbell), *review* by Dr I C McNeill, 490
Polymer Column Fractionation Large-Scale (Manfred J R Cantow, Roger S Porter and Julian F Johnson), 752
Polymer Morphology Contribution of Electron Microscopy to (Electron Microscope Society of America Symposium on), 610
Polymerizations (Solid-State) Effect of Mechanical Stress on some (Dr C H Bamford, Dr G C Eastmond and Dr J C Ward), 1036
Polymers (Ethylene) Technology of, *review* by Prof C E H Bawn, 837
Polymers (High) An Introduction to the Organic Chemistry of (Prof Carl S Marvel), *review* by Dr I C McNeill, 591
Polymers (Molten) Unstable Flow of (J J Benbow, R V Charley and P Lamb), 223
Polymorphism Insect (Prof O W Richards), 412
Polymorphism in Insects (Royal Entomological Society Symposium on), 412
Polymorphism (Haemoglobin), in Fishes (Dr Knud Sick), 894
Polymorphism (Third Molar), and the Timing of Tooth Formation (Stanley M Garn, Arthur B Lewis and Batsheva Bonné), 989
Polynucleotide Field The, *review* by Dr C B Reese 836
Polynucleotides—Natural and Synthetic Nucleic Acids (Dr Robert F Steiner and Dr Roland F Beers, Jr), *review* by Dr C B Reese, 836
Polypeptide Chains of Gorilla Haemoglobin Amino-Acid Composition of the (Emile Zuckerkandl and W A Schroeder), 984
Polypeptide Derivatives Antibacterial Synthetic (Dr K Kovacs, Dr A Kotai, I Szabo and R Mecseki), 190
Polypeptides Cobalt Complexes of Proteins and (Dr Jake Bello and Helene R Bello), 1184
Polyporic Acid A Novel Type of Anti-oxidant related to (Dr G J Bennett and Dr N Uri), 354
Polysaccharide Content of the Prolapsed Nucleus Pulposus of the Human Intervertebral Disk (Dr F Happey, Dr A Wiseman and A Naylor), 868
Polysaccharide Metabolism Role of the Thymus in (G Csaba, G Toth, Prof I Toro, Th Ács and L Csaki), 1304
Polysaccharides (Structural), of Algal Cell Walls Variants in the (Dr Eva Frei and Prof R D Preston), 939
Polystyrene Latexes (Monodisperse), in Arrays Optical Calibration of some (Dr Herbert E Kubitschek), 1148
Polythene, the Technology and Uses of Ethylene Polymers (edited by A Renfrew and Philip Morgan), second edition, *review* by Prof C E H Bawn, 837
Pongo pygmaeus (Orang-Utan) Chromosomes of the (Dr Brunetto Chiarelli), 285
Pontén, Jan, and others Rapid Preparation of Fluorescent Antibodies using Gel-Filtration, 182
Popjak, Dr S Gas Chromatography in Medical Research (Gas-Liquid Radiochromatography), 717
Popper, Hans, and others Nature of Increased Protein and DNA in Chronic Hepatic Injury, 886
Population Bulletin, Vol 17, No 6, Population Trends in the U S S R (Population Reference Bureau, Inc), 1142
Population Redistribution and Economic Growth, United States, 1870-1950 (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grenenik, 853
Population Reference Bureau, Inc *Population Bulletin*, Vol 17, No 6, Population Trends in the U S S R, 1142
Population Structure Molecular Biology and (British Association for the Advancement of Science, Section D (Zoology), and Section K (Botany), Joint Symposium on), 414
Population Trends in the U S S R (Population Reference Bureau, Inc, *Population Bulletin*, Vol 17, No 6), 1142
Populations (Marine), in Icelandic Waters Fluctuations in (G Bodvarsson and J Jonsson), 768
Pore Sizes A Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various (G K Ackers and R L Steere), 436
Porous Media Distribution of Pressure for Flow of Gas through (G J Field and Dr H Watts), 1277
Porphyrin Ring System Detection of Carboxyl Groups in Conjugation with the (P S Clezy), 750
Porphyrins and Chlorophylls Biosynthesis of (Dr K D Cibson Margaret Matthew, Prof A Neuberger and G H Tait), 204
Porte, A L Appointed to a lectureship in chemistry in the University of Glasgow 1132
Porteous, Dr I B Persistence of Motility in Bone-Marrow Cells from the Cadaver, 569
Porter, Dr J G Astronautics (Orbits in the Solar System) 310
Porter, Roger S, and others Large-Scale Polymer Column Fractionation 752
Portugal A Mammalian Fauna from the Kimmeridgian of (Dr Walter G Kuhne) 274
Possible Bearing on Philosophy Evolution of Regeneration, and its (Dr R J Spilsbury), 1254 (Dr A E Needham), 1255
Possible Causes for Production of Isoleucine by *Streptomyces rimosus* (Dr I Horvath I Gado and A Szentirmai), 641
Possible Factor controlling Biosynthesis of Arylesterase Sex Hormones as a (Dr Klas-Bertil Augustinsson and Bertil Olsson), 969
Possible Intermediate in Oxidative Phosphorylation Detection of a (Dr C H Suelter, M DeLuca, Dr J B Peter and Prof P D Boyer), 43
Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei— (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Possible Origin of the Use of Fire by Early Man (D C Arnold) 1318
Possible Relation to Mutagenic Properties of Alkylating Agents Acidic Dissociation of 7 9-Dialkylguanines and its (Dr P D Lawley and P Brookes), 1081
Possible Skin Carcinogens An Early Test for (Olav Hilmar Iversen), 273
Possible Solar Flare Effects in the *F* Region of the Ionosphere (Dr G H Munro), 347, (Dr R W Knecht and Dr K Davies), 348
Possible Spermiogenesis of Guinea Pig Testicular Cells grown *in vitro* Spermatocytogenesis with (Dr Russell T Jordan, Dr Seymour Katsh and Nadia de Stackelburg), 1053
Post Office (General) Retirement of T A Davies as inspector of wireless telegraphy in the Wireless Telegraph Section of the Radio Services Department, 1129
  Appointment of R Billington as inspector of wireless telegraphy in the Wireless Telegraph Section of the Radio Services Department, 1129
Postgraduate Courses at the Imperial College of Science and Technology, London, 115
Potassium Influence of some Organic Salts on the Absorption of, by Vermiculite (Prof M M Mortland), 481
  Modification of the Inotropic Activity of Calcium by (Winifred G Nayler), 268
Potassium in Baker's Yeast Distribution of (Dr W McD Armstrong), 65
Potassium–Argon Age Determinations on Granite from the Island of Mahe in the Seychelles Archipelago (J A Miller and J D Mudie), 1174
Potassium-42, Chlorine-36 and Iodine-131 (Sodium-24,) Permeability of the Mammary Gland to (P -G Knutsson), 977
Potassium Chloride Radio-Luminescence in Sodium Chloride and (S B Hyder and B K Gupta), 60
Potassium Chloride (Crystalline) Incorporation of Trivalent Cations in (Dr Marian E Hills and Prof Allen B Scott), 1066
Potassium Concentrations (Red Blood Cell), medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep Relationships between (Prof J V Evans), 567
Potassium Content (Sodium and), in the Muscles of Hibernating Animals (Dr Einar Eliassen and Helge Leivestad), 459
Potassium Gibberellate Effect of Temperature and, on Phases of Growth of Algerian Ivy (J R Goodin and Prof V T Stoutemyer), 677
Potassium–Argon Ages at Broken Hill, Australia (Dr J F Evernden and Dr J R Richards), 446
Potency (Insecticidal) Effects of 2-Diethylaminoethyl 2,2-Diphenylpentanoate (SKF 525A) on (P S Hewlett, C J Lloyd and Angela N Bates), 1273
Potent Analgetic Antagonist A New (Maxwell Gordon, John J Lafferty, David H Tedeschi, Nathan B Eddy and Everette L May), 1089
Potent Non-Toxic Plant-Growth Inhibitor from an Antibiotic Fermentation (Dr L G Nickell and W D Celmer), 1098
Potential Productivity of Marrow Stem and Thousand-headed Kale (Dr L G G Warne), 579
Potential (Electrical Surface), of Red Blood Cells Agglutination and the (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Potential (Membrane Action), of the Heart Effects of Intensity of Driving Stimulus on the Shape of (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Potential (Osmotic) Importance of, as a Component of the Total Potential of the Soil Water on the Movement of Nematodes (C D Blake), 144

Potential (Total), of the Soil Water Importance of Osmotic Potential as a Component of the, on the Movement of Nematodes (C D Blake), 144
Potential Use in Agriculture Venturicidin, a New Antifungal Antibiotic of (A Rhodes, K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
Potter, Dr A E (Massey, Sir Harrie, and) Atmospheric Photochemistry, 213
Pottery (Medieval Glazed) A Spectroscopic Survey of English and Continental (L C Thomas and J W G Musty), 1143
Potts, Dr J G , and others Life and its Environment in Ancient Seas (Aspects of the Palaeoecology of Marine Faunas in the Upper Carboniferous of the Southern Pennines), 925
Poultry Nutrition and (Scottish Group of the Nutrition Society Symposium on), 615
Powder Milk (Ministry of Agriculture, Fisheries and Food , Department of Agriculture and Fisheries for Scotland , Department of Health for Scotland), 607
Powders (Human, Cow and Rabbit Native Fibrin), as Anticoagulants (Dr A L Copley and Beverly Becher), 568
Powell, A L T , and others A New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of Transient Magnetic Fields, 622
Powell, Prof C F Awarded a Royal Medal of the Royal Society, 707, 905 , work of, 905
Power, Dr E A Appointed to the readership in applied mathematics at University College, London, 922
Power, Ministry of Appointment of C T Melling as a member of the Advisory Council on Research and Development, 115
  Annual Report for 1960 of the Safety in Mines Research Establishment, 709
Power Reactor *Nora*, a New Zero (Norwegian Atomic Energy Institute), 918
Poynter, Dr F N L Chemistry in the Service of Medicine, 1017
Practical Approaches (Fundamental and), to Ageing Protection (Natural Rubber Producers' Research Association Symposium on), 115
Practical Microscopy (Dr C L Duddington), *review* by Dr S Bradbury, 904
Practice of Hydraulic Measurements Hydrometry—Theory and (Prof Adam T Troskolanski), *review* by Prof S P Hutton, 842
Practitioner Vol 187, No 1120, Special issue dealing with Recent Developments in Medical Treatment, 506
Pramer, Prof David (Winkler, E J , and) A Chamber for Culturing and Collecting the Nematode *Panagrellus redivivus*, 472
Prandtl, Ludwig Gesammelte Abhandlungen zur Angewandten Mechanik, Hydro- und Aerodynamik (herausgegeben von Walter Tollmien, Hermann Schlichting und Henry Gortler , schriftlietung F W Riegels), Teile 1-3, *review* by M James Lighthill, 841
Prankerd, Dr T A J (Lovell, D and) Effect of Quinones on the Uptake of Oxygen by Red Cells, 561
Pratt, Prof D (Boring, J R , and) Spheroplasts of Marine Bacteria induced by the Action of Penicillin, 773
Pre-Harvest Prophylaxis for Infestation Control in Stored Food-Grains (S K Majumder, K Krishnamurthy and S Godavari Bai), 375
Pre-Hibernating and Deep-Hibernating Hedgehog Changes of Blood Volume in the (Dr Einar Eliassen), 1047
Pre-Viral Genome in Silkworms A Gene synthesizing Protease and a (Prof Kazuo Yamafugi and Fumiko Yoshihara), 782
Precipitating Antibodies in the Carpet Snake against Parasitic Nematodes (H Timourian, C Dobson and J F A Sprent), 996
Precipitating Antibody to Insulin (Valerie E Jones and Prof A C Cunliffe), 136
Precipitation (Antigen–Antibody), contrasted in Gels of High and Physiological Salt Concentrations (Dr Alfred J Crowle and David C Lueker), 50
Precipitation, Soil and Animals in Norway Caesium-137 and Strontium-99 in (T Hvinden and A Lillegraven), 1144
Précis de Climatologie (Prof Ch P Peguy), *review* by Prof W B Fisher, 1223
Precision Electromagnetic Measurements (United States National Bureau of Standards 1962 International Conference on), 922
Prediction based on Cross-Sectional Analysis Validity of (Gwynneth de la Mare and R Sergean), 1318
Predictions (Orbital), for Artificial Satellites of Earth Errors in (Kenneth Moe), 151
Predvoditelev, A S (edited by) Physical Gas Dynamics (translated from the Russian by Dr R C Murray and D R H Phillips), *review* by Dr I S Donaldson, 837
Pregnancies (Normal) Primary Embryonal Sex Ratio in, determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch Mehes), 476
Pregnancy Effect of Age and, on the Tolerance of Tsetse Flies to Insecticides (G F Burnett), 188
  Effect of Progesterone on—Method of Administration and Effect of Progesterone (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329 , Effect of a Phospholipid Factor on the Activity of Progesterone (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
Pregnant Rat and Rabbit Plasma Iron and Iron-binding Capacity in the (E H Morgan), 461
Preliminary Bionomic Data from West African Fisheries (Trawl Fishing in the Tropical Atlantic), (Alan R Longhurst), 621
Premio Feltrinelli for biological sciences of the Accademia dei Lincei, Rome, awarded to Prof J B S Haldane, 710
Prentice, Dr J E Appointed reader (at King's College, London) in geology, 802
Preparation of Single-Crystal Graphite from Melts (Pei Ching Li), 864
Preparation (Chromosome), from Fresh and Cultured Tissues using a Modification of the Drying Technique (M Fox and Dr I M Zeiss), 1213
Preparation (Rapid), of Fluorescent Antibodies using Gel-Filtration (Johan Killander, Jan Ponten and Lennart Roden), 182
Preparation and Determination of Sulphosalicylo-soluble Proteins using Tannin (W Mejbaum-Katzenellenbogen, W Dobryszycka and B Morawiecka), 262 , *erratum*, 802
Preparation and Use of Case Studies (South London Branch of the British Institute of Management Conference on), 21
Preparations from Two Ox Muscles Comparative *in vitro* Activities of Phosphorylase *b* and Cytochrome Oxidase in (E J Briskey and R A Lawrie), 263
Preparations (Chromosome), obtained directly from Peripheral Blood (M A Kinlough and Prof H N Robson), 684
Preparations (Purified Nucleic Acid) Transmission of Mouse Leukaemia with (Dr Esther F Hays), 230
Preparations (Sub-Nuclear), from Rat Liver Nuclei Incorporation of ^{14}C-Glycine by (K R Rees, Hazel F Ross and G F Rowland), 171
Preparative Methods of Polymer Chemistry (Wayne R Sorenson and Tod W Campbell), *review* by Dr I C McNeill, 490
Preparing *Corynebacterium pyogenes* Toxoid with High Anti-Haemolysin Titre in Rabbits New Method of (Valerie Levy), 189
Preputial Glands (Female Rat), as a Source of β-Glucoronidase (Dr Margaret I Stern), 359
Presence of Bacteria Serum β-Globulin Types in Red Deer and other Species and their Stability in the (V P W Lowe and E I McDougall), 983
Presence of Haptoglobin in Synovial Fluid (Prof Otto W Neuhaus and Virginia P Sogoian), 558
Presence of Penicillin Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of Cytidine Diphosphate in the (Dr J J Saukkonen), 816
Presence of Peroxidase Interaction of ^{14}C-Œstrone with Tryptophan in the (Dr P H Jellinck and Louise Irwin), 660
Presence of Two Iron-Transport Proteins in Serum (Dr M Faber and R Jordal), 181
Presence and Correlation of Fine Structure in Jovian Decametric Radiation (James N Douglas and Harlan J Smith), 741
Present The Search for Order—the Development of the Major Ideas in the Physical Sciences from the Earliest Times to the (Cecil J Schneer), *review* by Prof Herbert Dingle, 901
Pressure for Flow of Gas through Porous Media Distribution of (G J Field and Dr H Watts), 1277
Pressures (Root-) in Palms High (T A Davis), 277
Preston, Dr B N (Peacocke, Dr A R , and) Effect of Gamma-Rays on Thymus Nucleoprotein in Solution, 228
Preston, Dr G B Promoted to Senior Principal Scientific Officer, 214 , work of, 214
Preston, J S Photometric Standards and the Unit of Light (National Physical Laboratory, Notes on Applied Science No 24), 1250
Preston, Prof R D Electron Microscopy, *review*, 1220
Preston, Prof R D (Frei, Dr Eva, and) Variants in the Structural Polysaccharides of Algal Cell Walls, 939
Preventing Lysis of some Marine Bacteria Solute Requirements for (Prof. Robert A MacLeod and Tibor Matula), 1209
Prevention of Freezing Damage to Living Cells by Pyridine *N*-Oxide (T Nash), 360
Prevention by Histidine Cytotoxic Effect of Aminoacetonitrile on Fibroblast Cultures and its (Dr J Mager, Z Fuchs, S Halevy and I Sciaky), 170
Přibil, R , and Vydra, F Microchemical Techniques (Oxidimetric Microtitration of Cobalt), 411
Price, Prof Derek J de Solla Science since Babylon, *review* by Dr W P D Wightman, 825
Price, Prof W C At the Third Australian Spectroscopy Conference (Vibrational Spectroscopy), 927 , (Ionization Potentials of some Simple Radicals and Molecules in terms of their Electronic Structure), 927
Price, W T *Obituary* of Prof Robert Boutflour, 1021
Priestley Lectures Thirty-fifth Annual—Selected Studies in Chemical Kinetics (Prof Farrington Daniels), *review* by Prof J M Coulson, 297
Priests and People (Dr Conor K Ward), *review* by the Rev J Robinson, 102
Primary Embryonal Sex Ratio in Normal Pregnancies determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch. Mehes), 476
Primates (Prosimian) Alkali-resistant Haemoglobins in (Prof John Buettner-Janusch and Joseph B Twichell), 669
Primes Representations of, by Quadratic Forms (prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta), (edited by J C P Miller), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson, 97
Primordia (Leaf) Determination of Cell Numbers in (Dr E J Hewitt and L A Wilson), 578
Prince, Prof Jack H , and others Anatomy and Histology of the Eye and Orbit in Domestic Animals, *review* by Dr E N Willmer, 295
Prince, Dr R H The Study of Fast Reactions (Techniques for the Measurements of Fast Reactions in Solution), 1136
Princeton University Mathematical Series, Vol 26, Riemann Surfaces (Prof Lars V Ahlfors and Prof Leo Sario), *review* by Prof W K. Hayman, 847
  Fellowships in Engineering Study and Fundamental Research in Plastics, 921
Principle (Mach's) Dirac's Cosmology and (Prof R H Dicke), 440 , (Prof P A M Dirac), 441
Principle (Toxic), of *Dichapetalum toxicarium* (18-Fluoro-*cis*-9-Octadecenoic Acid) Synthesis of the (Prof F L M Pattison and R E A Dear), 1284
Printing (Letterpress) Productivity in (Department of Scientific and Industrial Research), 1143
Printing and Furniture Licentiates in (City and Guilds of London Institute), 920
Probability Inductive (John Patrick Day), *review* by F I G Rawlins, 695
Probability Distribution Analyser programmed for Neurophysiological Research (Dr W R Levick, Prof P O Bishop, W O Williams and Prof D G Lampard), 629
Probability Theory (Prof Michel Loeve), second edition, *review* by D G Kendall, 7
Probability and Statistics Contributions to—Essays in Honor of Harold Hotelling (edited by Ingram Olkin, S G Ghurye, Wassily Hoeffding, William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
Probable Mechanism of Resistance of Varieties of Cocoa to Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl (Dr John A Spence), 278
Probine, Dr M C Quantitative Biology (Physical Properties of the Primary Wall of Plant Cells), 25
Problems World Food, *review* by Dr W R Aykroyd, 1006

Problems on Infection, Immunity and Allergy in Acute Radiation Diseases (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Problems in Quantum Mechanics (Dr I I Gol'dman, Dr V D Krivchenkov, V I Kogan and V M Galitskii), *review* by S F Edwards, 1005
Problems in Quantum Mechanics (Dr I I Gol'dman and Dr V D Krivchenkov), edited by Prof B T Geilikman (translated from the Russian by E Marquit and E Lepa), authorised revised edition, *review* by S F Edwards, 1005
Problems of Radioactivity at Water and Sewage Works (Course of lectures on, in the Department of Municipal Engineering of Manchester College of Science and Technology), 609
Problems (Agricultural), in Developing Countries (Nutrition Society Symposium on), 1028
Procedure (New Indirect Fick), for the Determination of Cardiac Output (Dr J G Defares, Dr M E Wise and Prof J W Duyff), 760
Procedures (Stereotaxic), for Parkinsonism Arrest of Acceleration of Speech evoked by Thalamic Stimulation in the Course of (Dr G Guiot, and collaborators), 921
Processes (Combustion) Gas Sampling and Chemical Analysis in (Prof G Tiné), *review* by Dr C F Cullis, 1108
Processes (High-Temperature Melting) A Cold Crucible for (H F Sterling and R W Warren), 745
Processes (Oxidation), in Chemical Manufacture (Society of Chemical Industry Symposium on), 1134
Processing Automatic Data (Derek Wragge Morley), 1024
Processing (Food), in relation to Health (British Association for the Advancement of Science, Section I (Physiology and Biochemistry), Discussion on), 599
Procrastination (Planned) Occupational Versatility and (Prof Alec Rodger), 607
Producing Transplantable Human Tissue in the Laboratory (Dr D Petrucci), 21
Production of 'Active' Magnesium Oxide by Heating in Vacuum (R Valverde and J P Saenz), 653
Production of Aortic Occlusion resembling Acute Aortic *Embolism* Syndrome in Cats (Roy K Imhoff), 979
Production of Chromatid Aberrations by Diepoxybutane and an Iron Chelator (Prof Norman S Cohn), 1093
Production of Collagenase A Simplified Culture Medium for the (Dr G H Warren and Jane Gray), 755
Production of High Molecular Weight Products from the Irradiation of Methane with the 4-MeV Electrons (R W Hummel), 1178
Production of Isoleucine by *Streptomyces rimosus* Possible Causes for (Dr I Horvath, I Gado and A Szentirmai), 641
Production by Normal Uninfected *Serum-free Cell Cultures* Cytopathic Protective Factor, its (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Production of Slime Substance in Mixed Cultures of *Rhodopseudomonas capsulatus* and *Azotobacter vinelandii* (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Production and Properties of Di-fluorocarbene (Dr J P Simons and A J Yarwood), 943
Production (Antibody), in an *in vitro* System Importance of Cell Division for (R W Dutton), 462
Production (Dihydroxyacetone), in *Acetomonas* (Dr J G Carr and J L Shimwell), 683
Production (Submerged Culture), of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Productivity in Letterpress Printing (Department of Scientific and Industrial Research), 1143
Productivity (Potential), of Marrow Stem and Thousand-headed Kale (Dr L G G Warne), 579
Products of the γ-*Radiolysis of Aqueous Cystine Solutions* (Dr D W Grant, S N Mason and M A Link), 352
Products of Orcinol Oxidation Effect of Copper on (Dr T F Slater), 420
Products (Atmospheric Photochemical) ('Smog') Interaction of Light and, within Plants (O C Taylor, W M Dugger, jun, E A Cardiff and E F Darley), 814
Products (Combustion) Sampling and Analysis of, *review* by Dr C F Cullis, 1108
Products (Fission) The Entry of, into Food Chains (edited by J F Loutit and R Scott Russell), *review* by Dr Hugh D Evans, 6
Products (High Molecular Weight), from the Irradiation of Methane with 4-MeV Electrons Production of (R W Hummel), 1178
Products (Interaction), of Adenine and Adenosine Phosphates with Formaldehyde (Dr D L Woodhouse), 336
Products (Long-lived *Fission*), *and Level of Activity in* Milk Analysis of the Relationship between Deposition of (Dr W Anderson, L K Burton and J O Crookall), 1009
Products (Stratospheric Fission) Transfer of, into the Troposphere (D H Peirson), 497
Professional Civil Servants in Britain, 1003
Progesterone Effect of a Phospholipid Factor on the Activity of (Effect of Progesterone on Pregnancy), (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
  Effect of, on Pregnancy—Method of Administration and Effect of Progesterone (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329 ; Effect of a Phospholipid Factor on the Activity of Progesterone (Dr Tapani Luukkainen and Dr Arpad I Csapo), 331
  Method of Administration and Effect of (Effect of Progesterone on Pregnancy), (Dr Arpad I Csapo and Marny A Lloyd-Jacob), 329
Progress Cancer, 1960 (edited by Ronald W Raven), *review* by Dr F J C Roe, 298
Progress in Cancer Research, *review* by Dr F J C Roe, 298
Progress of Cancer Research (D G Arnott, Dr I Hieger and A L Levene), 1251
Progress *in Dielectrics* (edited by Dr J B Birks and Prof J Hart), Vol 3, *review* by V Daniel, 203
Progress in Industry, 689
Progress in Microchemical Methods and Techniques (A J Barnard, jun, and John Y Steel), 410
Prolapsed Nucleus Pulposus of the Human Intervertebral Disk Poly*saccharide Content of the* (Dr F Happey, Dr A Wiseman and A Naylor), 868
Proline Structures and Conformations of some Naturally Occurring Derivatives of (R J Abraham, K A McLauchlan, Shirley Dalby, Prof G W Kenner, R C Sheppard and L F Burroughs), 1150
Prolonged Biological Half-Life of Sodium-22 in Patients with Essential Hypertension (Dr Lewis K Dahl, Malcolm G Smilay, Lawrence Silver and Sanford C Spraragen), 267
Prolonged Storage Stability of Dextran during (Dr W d'A Maycock and Dr C R Ricketts), 174
Promotion of Nature Reserves, Society for the Forty-fourth Annual Report 608
Propagation (Serial), of Types 1, 2, 3 and 4 Dengue Virus in HeLa Cells with Concomitant Cytopathic Effect (Sonja M Buckley), 778
Properties of some Copper Complexes—Five-Covalent Copper (II) Complexes *containing 1,10-Phenanthroline* and 2,2'-Bipyridyl (Dr C M Harris T N Lockyer and Hanneke Waterman), 424 ; The Trigonal-Bipyramidal Configuration of the Iodo *Bis*(2-2'-Bipyridyl) Copper (II) Ion, 425
Properties of Di-fluorocarbene Production and (Dr J P Simons and A J Yarwood), 943
Properties of the Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and Apoprotein Derivatives Structure and (Prof R K Morton), 727
Properties of Flour Protein Modification of the, by Thiolated Gelatin (E E McDermott and J Pace), 657
Properties of Peroxidase in Pig Thyroid Gland Demonstration and some (Toichiro Hosoya and Nobuo Ui), 659
Properties of Xanthine Dehydrogenase in the Silkworm, *Bombyx mori* L (*Yoshiyuki Hayashi*), 756
Properties and Uses of Indian Timbers Identification, *review* by Dr C R Metcalfe, 1110
Properties (Antibiotic), of Mycelium and Metabolites of *Myrothecium roridum* Tode (Andrzej Nespiak, Marian Kocor and Antoni Siewinski), 138
Properties (*Anti-fouling*) A Coating with, from the Reaction between Cuprous Oxide and Sodium Silicate (J R Rischbieth and F Marson), 748
Properties (Anti-hypertensive) A Non-diuretic Benzothiadiazine with (Dr Alan A Rubin, Franklin E Roth and Martin M Winbury), 176 ; *erratum*, 802
Properties (Dielectric), of Solid Secondary Alcohols A Transition in the (J S Dryden and H K Welsh), 255
Properties (Inhibitory), of the Catecholamines (Prof E G McGeer, P L McGeer and H McLennan), 563
Properties (Mutagenic), of Alkylating Agents Acidic Dissociation of 7 9-Dialkylguanines and its Possible Relation to (Dr P D Lawley and P Brookes), 1081
Properties (Photochemical), of Water-soluble *Chlorophyll* (*Prof Gerald* Oster and Suse B Broyde), 132
Properties (Physico-Chemical), of Paracrystalline Spherulites of Biological Origin Some (Dr G T Stewart), 624
Properties (Staining), of Stressed Bone (Prof M A MacConaill), 368
Properties (Surface), of Silver Iodide (Prof A C Zettlemoyer, Noubar Tcheurekdjian and J J Chessick), 653
Prophylactic Trypanocidal Drug (A New), 2,7-di-(m-amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium Chloride Dihydrochloride (*M & B* 4596), (S S Berg, K N Brown, J Hill and W R Wragg), 367
Prophylaxis (Pre-Harvest), for Infestation Control in Stored Food-Grains (S K Majumder, K Krishnamurthy and S Godavari Bai), 375
Propionate Metabolism of, by Homogenates of Normal Sheep Liver (R M Smith and W S Osborne-White), 868
Proposed Harmonic Generator or Mixer for *Optical Frequencies* (Dr K D Froome), 859
Prosimian Primates Alkali-resistant Haemoglobins in (Prof John Buettner-Janusch and Joseph B Twichell), 669
Prosser, Dr A P Colloids (Forces which, in conjunction with Electrostatic Forces, stabilize *all Colloidal Systems*), 930
Prostate (Rat) A Zinc-requiring Alkaline Phosphatase in the Ventral Lobe of the (Leonora Hopkinson and J C N Wakeley), 357
Prostatic Cytochromes (Leonora Hopkinson and F L Jackson), 264
Protease A Gene synthesizing, and a Pre-Viral Genome in Silkworms (Prof Kazuo Yamafugi and Fumiko Yoshihara), 782
Protection Radiation, *review* by Dr Hugh D Evans, 6
Protection by Antioxidants against Lethal Doses of Carbon Tetrachloride (Dr C H Gallagher), 881
Protection by Inorganic Condensed Phosphates against the Lethal Effects of X-Rays (J H Barnes and J St L Philpot), 574
Protection (Ageing) Fundamental and Practical Approaches to (Natural Rubber Producers' Research Association Symposium on), 115
Protection and Recovery Radiation (edited by Alexander Hollaender), *review* by Dr Hugh D Evans, 6
Protective Factor (Cytopathic), *its Production* by Normal Uninfected Serum-free Cell Cultures (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Protein Comparative Effects of Wet and Dry Feeding on the Utilization of, by Calves (A M Raven and K L Robinson), 1256
Protein (Animal), *in the Diet* *Cystine Content* in Hair of Children as influenced by Vitamin A and (Tatsuo Koyanagi and Teru Takanoashi), 457
Protein (Dye-) Conjugates Purification and Concentration of, *by Gel* Filtration (Dr W George and Dr K W Walton), 1188
Protein (*Flour*) *Modification* of the Properties of, by Thiolated Gelatin (E E McDermott and J Pace), 657
Protein (Glycolipo-) Excretion of Uncrystallized Urinary Calculi composed of, by Normal and Muscular Dystrophic Mice (C McGaughey), 1267
Protein (Haemin-) Binding in Peroxidase and Methaemalbumin (Dr A C Maehly), 630
Protein (Increased), and DNA Nature of, in Chronic Hepatic Injury (Dr Emanuel Rubin, Ferenc Hutterer, Elemer Cs Gall and *Hans Popper*), 886
Protein (Nuclear), of Neoplastic Tissues Binding of *RP2-L*—a, to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870

Protein Components (Nucleic Acid and) Dissociation of Foot-and-Mouth Disease Virus into its (F Brown and B Cartwright), 1163
Protein Conjugates (Fluorescent) Purification of—Comparison of Charcoal and 'Sephadex' (Dr J E Fothergill and Dr R C Nairn), 1073
Protein Fibers Ultrastructure of—Collagen, Muscle and Keratin (Electron Microscope Society of America Symposium on), 610
Protein Fractions (Serum), of the Developing Chicken Embryo Comparison of the, by the Technique of Starch-Gel Electrophoresis (A Amin), 356
Protein Molecules Montmorillonite as a Caliper for the Size of (Prof A D McLaren and G H Peterson), 960
Protein Synthesis (Microsomal), produced by Dimethylnitrosamine Counteraction by Cysteine of Glycogenolysis and Inhibition of (Dr P Emmelot and I J Mizrahi), 42
Protein-bound Amino-acids *in vivo* Quantitative Aspects of the Re-Utilization of (Dr H Walter and H Zipper), 1292
Proteinases (Intestinal), in an Insect *Calliphora vomitoria* L (Dr Alastair Fraser Richard A Ring and Robin K Stewart), 999
Proteins General Nature of the Genetic Code for (Dr F H C Crick, Leslie Barnett, Dr S Brenner and Dr R J Watts-Tobin), 1227
  Nuclear Magnetic Resonance Spectroscopy of—the Hydrogen Bonding of Water in Bovine Serum Albumin Solutions (F A Bovey), 324
  Simple Microdiffusion Technique for the Radioiodination of (Dr R N Banerjee and R P Ekins) 746
Proteins of Gastric Juice Agarophoresis and Immuno-electrophoresis of the (M Tenorova, E Stuchlikovi and J Kořinek), 763
Proteins (Auxin-bound) Formation of (Archana Sen Gupta and S P Sen), 1290
Proteins (Globular) Influence of *p*H and Urea on the Ultra-violet Fluorescence of several (Dr R F Steiner and H Edelhoch) 873
Proteins (Iron-Transport), in Serum Presence of Two (Dr M Faber and R Jordal), 181
Proteins (Serum) Starch Gel Electrophoresis of Hen Egg White, Oviduct White, Yolk, Ova and (Dr F Steven), 972
Proteins (Sulphosalicylo-soluble) Preparation and Determination of, using Tannin (W Mejbaum-Katzenellenbogen, W Dobryszycka and B Morawiecka), 262 , *erratum* 802
Proteins and Polypeptides Cobalt Complexes of (Dr Jake Bello and Helene R Bello), 1184
Proteolysis of Thyroglobulin by Thyroid Enzymes (Dr Mary T McQuillan, J D Mathews and Prof V M Trikojus), 333
Protoactinium-231 Nuclear Spin of, from Hyperfine Splitting (E W T Richards, A Ridgeley, N J Atherton and H S Wise), 444
Protoplasts (Yeast) Physical Conditions as Important Factors for the Regeneration of Naked (Dr O Nečas), 580
Protozoa Behaviour of, under the Influence of the Synergetic Action of Polyethylene Glycol and Dyes (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Protozoa (Gregarine and Coccidian) Periodic Acid–Schiff Technique for the Demonstration of Extra- and Intra- cellular Stages of (Dr J B Jennings), 473
Prouvost-Danon, A , and Moussatche, Dr H Influence of Anaerobic Glycolysis on Release of Histamine in the Guinea Pig and Rat Anaphylactic Reaction *in vitro*, 361
Pseudomonas mors-prunorum Wormald Relationship between Phage Type and Host Plant in (J E Crosse and Constance M E Garrett), 379
Psychical Research, *review* by F I G Rawlins, 901
  Williams James on (compiled and edited by Gardner Murphy and Robert O Ballou), *review* by F I G Rawlins, 901
Psychology at Cardiff, 918
Psychology, British Journal of Monograph Supplement No 13, Learning Theory and the Therapy of Neurosis (Ralph Metzner) 405
2-^{14}C-Pteroyl-L-Monoglutamic Acid Conversion of, into Isoxanthopterin in *Drosophila melanogaster* (Dr J A Blair), 757
Public Accounts, Committee of Third Report, Session 1960-61, 691
Public Expenditure Control of, 485
Public Health Science and, 1024
Public Service Scientists in the—Special Promotions, 214
Publications (Technical), of the Oak Ridge National Laboratory, 1240
Pugwash Conference on Science and World Affairs Seventh (International Co-operation in Pure and Applied Science), 1232
Pullman, B Structure, Synthesis and Function of Deoxyribonucleic Acid (Electronic Aspects of Nucleic Acid Structure) 24
Pulmonary Lymph Nodes of Human Beings Concentration of Inhaled Cerium-144 in (K Liebscher, Dr T Schonfeld and A Schaller), 1308
Pumper, Dr R W , and others Utilization of Sheep Red Blood Cells in the Haemadsorption Test for Myxoviruses, 582
  Cytopathic Protective Factor its Production by Normal Uninfected Serum-free Cell Cultures, 1101
Pupal Brain Surgery Effect of, on the Rocking Response of *Automeris* (Dr A D Blest), 373
Pure and Applied Science International Co-operation in (Seventh Pugwash Conference on Science and World Affairs), 1232
Purification of Fluorescent Protein Conjugates—Comparison of Charcoal and 'Sephadex' (Dr J E Fothergill and Dr R C Nairn), 1073
Purification of Hydrogen Isotopes by Self-Displacement Chromatography at Low Temperatures (Dr T R Phillips, D R Owens and A G Hamlin), 1067
Purification of Urinary Conjugated Œstrogens by Gel Filtration (C G Beling), 326
Purification and Concentration of Dye-Protein Conjugates by Gel Filtration (Dr W George and Dr K W Walton), 1188
Purified Growth Hormone Failure of the, to restore the Size of the Kidneys in Hypophysectomized Rats (Dr T Astarabadi), 270
Purified Nucleic Acid Preparations Transmission of Mouse Leukaemia with (Dr Esther F Hays), 230
Purify Blue-Green Algae Use of Antibiotics to (Blue-Green Algae), (Dr Y T Tchan and J Gould), 1276
Purines and Pyrimidines (Methylated) Crystal Structures of Salts of (R F Bryan and K Tomita), 812
Purity (Chromatographic) Use of Phenol in determining (B H Koeppen), 360
Purnell, Dr J H The Study of Fast Reactions (High-speed Gas Chromatography), 1137
Purple Bacteria Biosynthesis of Carotenoids in—a Re-Evaluation based on Considerations of Chemical Structure (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Pursey, D L Appointed to a lectureship in theoretical physics in the University of Glasgow, 1132
Pustular Dermatitis Virus (Contagious) Growth of, in Human Tissue Cultures (Prof A Macdonald and T M Bell), 91
Putnam, A A Vortex Shedding from the End of a Tube as a Result of Buoyancy Effects, 1277
Puzzolanic Activity and Semiconductivity of Fired Kaolin and Kaolinitic Clay (A K Chatterji), 1180
Pyke, Dr Magnus Food Processing in relation to Health (Dietary Protein in relation to Health), 601
Pyridine *N*-Oxide Prevention of Freezing Damage to Living Cells by (T Nash), 360
Pyridoxamine Reversal of Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine for *Candida albicans* by Pyridoxine and (Dr M L Littman and Dr T Miwatani), 1155
Pyridoxine and Pyridoxamine Reversal of Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine for *Candida albicans* by (Dr M L Littman and Dr T Miwatani), 1155
Pyrimidines (Methylated Purines and) Crystal Structures of Salts of (R F Bryan and K Tomita), 812
Pyrolysis and Gas Chromatography for the Detection of the Benzene Ring in Organic Compounds (J H Dhont), 747
Pyrolytic Carbon Formation from Carbon Suboxide (B C Banerjee, T J. Hirt and Prof P L Walker, jun), 450

QUADRATIC Forms Representations of Primes by (prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta), (edited by J C P Miller), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson, 97
Quadrivalent Metal Halides Eight-Co-ordinate Diarsine Complexes of (Dr R J H Clark, Dr Jack Lewis, Prof R S Nyholm, Dr Peter Pauling and Dr G B Robertson), 222
Quantique (l'Électrodynamique) Introduction à (Prof Daniel Kastler), review by Dr P Roman, 1111
Quantitative Aspects of the Re-Utilization of Protein-bound Amino-acids *in vivo* (Dr H Walter and H Zipper), 1292
Quantitative Biology, *review* by Sir Hans Krebs, 591
  Informal Symposium on, at the Dominion Physical Laboratory, New Zealand, 25
Quantitative Estimation of Peak Areas in Gas-Liquid Chromatography (J Dijkstra), 965 , (Prof K K Carroll), 965
Quantitative Hypothesis Role of Water-regulating Mechanisms in Amphibian Morphogenesis—a (Peter Tuft), 1049
Quantitative Inorganic Analysis (Prof R Belcher and Dr A J Nutten), second edition, *review* by Dr G Kakabadse, 836
Quantitative Sub-Groups of the *B* Antigen in Man and their Occurrence in Three Racial Groups (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Quantitative Theory of the Character of Chemical Bonding in Binary Compounds (Prof Edward Gorlich), 133
Quantum Mechanics Introduction to (Prof Robert H Dicke and Dr. James P Wittke), *review* by S F Edwards, 1005
  Problems in (Dr I I Gol'dman and Dr V D Krivchenkov), edited by Prof B T Geilikman (translated from the Russian by E Marquit and E Lepa), authorised revised edition, *review* by S F Edwards, 1005
  Problems in (Dr I I Gol'dman, Dr V D Krivchenkov, V I Kogan and V M Galitskii), *review* by S F Edwards, 1005
  The Teaching of, *review* by S F Edwards, 1005
Quartz Dust Formation of Histamine and Histamine-like Substances from Histidine by (L W Marasas), 872
Quastel, Prof J H , and others Biochemical Aspects of Phagocytosis, 535
Queen Mary College, London Title of reader in pure mathematics conferred on Dr K W Gruenberg, 1132
Queen's University, Belfast Appointment of Dr R H J Sellin as lecturer in civil engineering, 710
  Appointment of F J Smith as lecturer in applied digital mathematics computing, 710
  Appointment of Dr Uno Opic as lecturer in applied mathematics, 710
Quenching (Self-) Geiger–Muller Counters Kinetics of Dissociation of Ethyl Halides in (Prof I Zlotowski and H Wincel), 550
Quesnel, Dr L B Birds of Tropical Paradise, *review*, 828
Quick, Prof Armand J Thromboplastic Activity of Red Cells, 882
Quiet Auroral Arcs A Morning Discontinuity in the Orientation of (Bengt Hultqvist, Alv Egeland and Georg Gustafsson), 956
Quiet and Disturbed Days (Magnetically) Diurnal Variation of High-Altitude Auroral Frequency on (Knut Lassen), 345
Quihillalt, Oscar A Elected president of the International Atomic Energy Agency, 21
Quilliam, Dr J P Appointed to the newly created chair of pharmacology at St Bartholomew's Hospital Medical College, London, 210 work of, 210
Quinchomolium chilense Lam Synergid Haustoria of (Saroj Agarwal), 1313
Quinones Effect of, on the Uptake of Oxygen by Red Cells (D Lovell and Dr T A J Prankerd), 561
Quintiliani, Dr M , and others Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays, 573

RABBIT Transaminase Activity in Arterial Tissue of the (Dhurjati Prasad Chattopadhyay), 660
Rabbit (Foetal) Hormonal Control of the Development of the Thymus of the (J G Bearn), 875
Rabbit (Pregnant Rat and) Plasma Iron and Iron-binding Capacity in the (E H Morgan), 461
Rabbit (Human, Cow and), Native Fibrin Powders as Anticoagulants (Dr A L Copley and Beverly Becher), 568
Rabbit Appendix Morphological Changes following Transplantation and Chronic Obstruction of the (J A Williams, W O Griffen, jun , and A Sharma), 867
Rabbit-Heart Sarcosomes Relationship between Oxidation of Isocitrate and Metabolism of Fatty Acids in (Dr W C Hulsmann), 1153

Rabbit Skin Isolation and Identification of Rhamnose from (Ina Malawista and Prof E A Davidson), 871
Rabbit Ventricular Fibres Evidence for Independence of Voltage of the Membrane Conductance of (Dr Edward A Johnson and J Tille), 663
Rabbits New Method of preparing *Corynebacterium pyogenes* Toxoid with High Anti-Haemolysin Titre in (Valerie Levy), 189
  Transmission of Lapinized Rinderpest Virus by Contact between (Dr G R Scott and C S Rampton), 289
Raccoon (Eastern) Natural Occurrence of *Leptospira icterohaemorrhagiae* in the Eastern Grey Fox and the (Dr L G Clark, J I Kresse, R R Marshak and C J Hollister), 1312
Rachitic Epiphyseal Cartilage of Albino Rat Free Amino-Acids in, and the Influence of Vitamin D (G V G Krishna Rao), 269
Racial Groups (Three) Quantitative Sub-Groups of the *B* Antigen in Man and their Occurrence in (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Rack, R S Agricultural Problems in Developing Countries (Practical Development of Native Fishing Industries in Northern Rhodesia), 1030
Raczkowski, Jan (Lawniczak, Maciej, and) Effect of Temperature on the Strain Recovery in Wood, 583
Radar Establishment (Royal) Resignation of W J Richards as director, 18
  Appointment of Dr G G Macfarlane as director, 18
  Promotion of Dr A F Gibson to Deputy Chief Scientific Officer, 214
Radiation—Use and Control in Industrial Application (Dr Charles Wesley Shilling), *review* by B E Jones, 855
  Action of on Synthesis of Deoxyribonucleic Acid in Normal and Tumour Strain Cells (Dr John Seed), 944, *erratum*, 1241
Radiation emerging from a Planetary Atmosphere with Rayleigh Scattering Tables related to (Kinsell L Coulson, Jitendra V Dave and Zdenek Sekera), *review* by Prof Zdenek Kopal, 1005
γ-Radiation Effect of, on *Escherichia coli* grown in Deuterium Oxide Medium (Ernest Pollard), 177
Radiation (Jovian Decametric) Presence and Correlation of Fine Structure in (James N Douglas and Harlan J Smith), 741
Radiation (Solar Type IV) Decimetre Radio Bursts concurrent with (T Krishnan and R F Mullaly), 58
Radiation (Ultra-Violet), and Desiccation Effect of, on Different Age-Cultures of *Escherichia coli* K12 (I L Mulay and G S Sperti), 773
Radiation (Ultra-Violet and Visible) Emission of, from Metals by the Impact of High-Energy Hydrogen Ions (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Radiation (Whole-Body) The Delayed Effects of—a Symposium jointly sponsored by the Operations Research Office and the Walter Reed Army Institute of Research (edited by Bernard B Watson), *review* by Dr Hugh D Evans, 6
Radiation Botany Vol I, No I, 404
Radiation Diseases (Acute) Problems of Infection, Immunity and Allergy in (N N Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova), translated from the Russian by Lydia Venters, *review* by Dr Hugh D Evans, 6
Radiation Effects on Lithium-doped Nickel Oxide Catalysts in Carbon Monoxide Oxidation (T Braun and I Maxim), 548
Radiation Protection, *review* by Dr Hugh D Evans, 6
Radiation Protection and Recovery (edited by Alexander Hollaender), *review* by Dr Hugh D Evans, 6
Radiation-induced Giant Cells of the Cultured Fibroblast Increase in the Dense Cytoplasmic Bodies in (Dr A F Hayward), 891
Radical (Difluoromethylene) Heat of Formation of the (Dr J R Majer and Dr C R Patrick), 866
Radical (Free-) Formation during Storage of Freeze-dried *Serratia marcescens* (Dr R L Dimmick, R J Heckly and D P Hollis), 776
Radio (Trans-Atlantic) Diamond Jubilee of, 919
Radio Astronomy Observatory The Australian National, 1019
Radio Bursts (Decimetre), concurrent with Solar Type IV Radiation (T Krishnan and R F Mullaly), 58
Radio Bursts (Type II Solar) Spectral Characteristics of (Prof P A Sturrock), 58
Radio Communication (Long-Range), by Satellite Microwave Dipoles, 109
Radio Engineers, British Institution of Clerk Maxwell Premium awarded to Dr G T Wright, 609
  Heinrich Hertz Premium awarded to R A Waldron, 609
  A F Bulgin Premium awarded to Dr A Kraus 609
  Arthur Gay Premium awarded to E Davies, 609
  Leslie McMichael Premium awarded to C H Dix and W E Wilshaw, 609
  Lord Rutherford Award awarded to E C Fellows, 609
  Charles Babbage Award awarded to E M Bradley, 609
Radio-Luminescence in Sodium Chloride and Potassium Chloride (S B Hyder and B K Gupta), 60
Radio Waves Cosmic (I S Shklovsky), translated by Richard B Rodman and Carlos M Varsavsky, *review* by Sir Bernard Lovell, 691
Radioactive Bismuth Isolation of, from Metallic Lead and its Compounds (J R W Kerr, Dr D I Coomber and Dr D T Lewis), 546
Radioactive Counting A Simple Flattener for holding Filter Papers on Planchettes for (Dr Edward A Smuckler and Prof Earl P Benditt), 191
Radioactive Fall-out and the Testing of Nuclear Weapons—Statement by the Medical Research Council, 400
Radioactive Males Inhibited Oviposition of Females of *Gryllus assimilis* (F), induced by, using L-Methionine-Methyl-^{14}C (Dr A A Abdel-Malek and D K McE Kevan), 681
Radioactive Phosphorus Specificity of Plant Feeding in Mosquitoes as determined by (Dr A A Abdel-Malek and Dr W F Baldwin), 178
Radioactive Waste Disposal, *review* by A W Kenny, 846
Radioactivity Problems of, at Water and Sewage Works (Course of lectures on, in the Department of Municipal Engineering of Manchester College of Science and Technology), 609
Radioactivity for Pharmaceutical and Allied Research Laboratories—a Symposium sponsored by Nuclear Sciences and Engineering Corporation (edited by Abraham Edelmann), *review* by Dr Hugh D Evans, 6
Radioactivity in Rainfall during September 1961 following the Russian Nuclear-Weapons Tests of September 1961 (Keith Boddy), 443
Radioactivity in Wool (S S Brar, P F Gustafson, M A Kerrigan, B C Breidenstein, U S Garrigus and W R Usborne), 1094
Radioactivity (Environmental) Report of the Steering Committee for Nuclear Energy and Council Decision on the Establishment of a Supervision and Emergency Warning System in Cases of Increase in (Organization for European Economic Co-operation), 31
Radioiodination of Proteins A Simple Microdiffusion Technique for the (Dr R N Banerjee and R P Ekins), 746
Radiological Defense Laboratory (United States Naval), San Francisco Appointment of Dr Olivier Heroux as scientist-in-residence, 1026
Radiolysis of Liquid Acetone—Effect of Dose-rate and Linear Energy Transfer (R Barker), 62
γ-Radiolysis of Aqueous Cystine Solutions Products of the (Dr D W Grant, S N Mason ard M A Link), 352
Radiometers (Two-Sphere Non-directional) A Method of Calibrating (Dr Walter Koch), 960
Radiometric Standards and Measurements (E J Gillham), (National Physical Laboratory, Notes on Applied Science No 23) 1250
Radioprotective Effects of Reserpine and its *N*-oxide (Dr Thomas J Haley, A M Flesher and L Mavis), 1309
Radiosensitive Organs in Rats exposed to X-Rays Effects of Iodoacetic Acid on Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some (Dr M Quintiliani, M Boccacci and L Tentori), 573
Radiosensitive Stages in the Spermatogenesis of *Drosophila melanogaster* (V A Strangio), 781
Radiosensitivities Mouse Lymphoma Cells with Different (Dr P Alexander and Z B Mikulski), 572
Radioxenon Tracer Loss of Fluorescent Particles in Atmospheric Diffusion Experiments by Comparison with (A E J Eggleton and N Thompson), 935
Radley Research Institute, J A, Reading Co-option of Dr A W Baldwin as a governor, 507
Radouco-Thomas, C, and others (edited by) Proceedings of the First International Congress of Neuro-Psychopharmacology (Rome, 1958), *review* by Prof W Ross Ashby 392
Rain Water Concentration of Chloride in Fresh Waters and (A V Holden), 961
Raindrops Size Distribution of (V N Kelkar), 252
Rainfall during September 1961 Radioactivity in, following the Russian Nuclear-Weapons Tests of September 1961 (Keith Boddy), 443
Ralph, Dr Lincoln The Fourth *R* (Library Association Annual Lecture), 931
Rama Rao, Sri B History of Sciences in Ancient and Medieval India (Zoological Knowledge in the Works of Kalidasa), 27
Ramakoteswara Rao, P, and others Rotational Analysis of ^{45}Cu^{35}Cl Bands, 444
Ramot, Dr Bracha, and others Distribution of Haptoglobin Types in Israel, 765
Rampton, C S (Scott, Dr G R, and) Transmission of Lapinized Rinderpest Virus by Contact Between Rabbits, 289
Rams (Merino) Seminal Degeneration induced in, by the Administration of Stilboestrol Dipropionate (G R Moule and P E Mattner), 364
Randall, D E Bibliography of Tables and Charts for Use in Gas Dynamic Studies, 308
Randall, Prof J T Transferred to the chair of biophysics at King's College, London, 922
Randolph, Dr M L, and others Electron-Spin Resonance Signals from Lyophilized Bacterial Cells exposed to Oxygen, 34
Random Loads Fatigue under (Dr A N May), 158
Rao, Dr C Raghupathi Distribution of Intensity among various Ultrasonic Diffraction Orders, 220
Rao, G V G Krishna Free Amino-Acids in Rachitic Epiphyseal Cartilage of Albino Rat and the Influence of Vitamin D, 269
Rao, V P, and others Cotton in India, Vol 2, *review* by Prof S C Harland, 200
Rapid Preparation of Fluorescent Antibodies using Gel-Filtration (Johan Killander, Jan Ponten and Lennart Roden), 182
Rapidly Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various Pore Sizes A Cell for (G K Ackers and R L Steere), 436
Raponda-Walker, Andre, et Sillans, Roger Les Plantes utiles du Gabon, *review* by T A Russell, 693
Rare Earths Analytical Chemistry of the (Dr R C Vickery), *review* by Dr D T Lewis, 593
Rare Interspecific Jute Hybrid Skewed Recombination in a (Dr M S Swaminathan and R D Iyer), 893
Rare Phenotype within the *Gm* System (K Henningsen and Jørgen C Nielsen), 476
Rat Demethylation of the Plant Œstrogen Biochanin *A* in the (Anna Nilsson), 358
  Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the Central Nervous System of the (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
  Selective Secretion of Circulating Antibodies in the Milk of the (E Ruth I Biswas), 883
Rat (Albino) Free Amino-Acids in Rachitic Epiphyseal Cartilage of, and the Influence of Vitamin D (G V G Krishna Rao), 269
Rat (Female White), during the Œstrual Cycle Variations in the Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the (E Brañez and H Roels), 1043
Rat (Male) Growth Hormone Activity of the Anterior Pituitary Lobe of the, at various Ages (R H Bowman), 976
Rat Adrenal Slices *in vitro* Enhancement of Steroidogenesis by, with Œstradiol-17-β (Prof Julian I Kitay), 358
Rat Anaphylactic Reaction *in vitro* (Guinea Pig and) Influence of Anaerobic Glycolysis on Release of Histamine in the (A Prouvost-Danon and Dr H Moussatche), 361
Rat Brain Effects of Electrical Stimulation of Reticular Formation on the Lactic Acid Content of the (Dr Lj Mihailovic, Lj Krzalic and D Cvetkovic), 1166
Rat Diaphragm (Isolated) Effect of Insulin on the Phosphorus-32 Mononucleotide Labelling of the, in the Controlled Absence of Extracellular Glucose (P Volfin, D Eboue and H Clauser), 166
Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin on Glucose Uptake and Intracellular Accumulation of Amino-Acids in (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Rat Lens Effect of Insulin on Pathways of Glucose Oxidation in the (Dr R Levari, Prof E Wertheimer, Dr E R Berman and Prof W Kornblueth), 1075

Rat Liver (Normal and Regenerating) Effects of Irradiation on the Incorporation of Amino-Acid into (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Rat Liver (Regenerating) Pituitary Effect on Synthesis of Deoxyribonucleic Acid in, following Whole-body X-Irradiation (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Rat Liver Nuclei Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from (K R Rees, Hazel F Ross and G F Rowland), 171
Rat Liver Xanthine Oxidase Effect of Colchicine on (Dr Ottilia R Affonso, Emilio Mitidieri and Gilberto G Villela), 666
Rat Liver and Brain Effects of 7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide on Mitochondria from (Bernhard Kadenbach and Prof Walter Luhrs), 174
Rat Preputial Glands (Female), as a Source of β-Glucuronidase (Dr Margaret I Stern), 359
Rat Prostate A Zinc-requiring Alkaline Phosphatase in the Ventral Lobe of the (Leonora Hopkinson and J C N Wakeley), 357
Rat Red Cells (Incubated), *in vitro* Effect of Hydrocortisone on Uptake of Iron-59 in (Peggy Clark), 667
Rat and Guinea Pig Kidney Slices Glutamyl Peptidases in (George G Glenner and John E Folk)—Histochemical Demonstration of γ-Glutamyl Transpeptidase-like Activity, 338 , Histochemical Characterization of a Unique α-Glutamyl Peptidase Activity, 339
Rat and Rabbit (Pregnant) Plasma Iron and Iron-binding Capacity in the (E H Morgan), 461
Rate of Beating of the Heart of *Periplaneta* Substances controlling the (K G Davey), 284
Rate of Erythropoiesis Increased Iron Absorption without Increase in the (Dr Gerald A Mendel), 878
Rate of Growth of Chicks Effect of Feeding Griseofulvin on (Dr W P Jaffe), 469
Rate of Ribonucleic Acid Biosynthesis Manner of expressing (D G Fraenkel and F C Neidhardt), 677
Rate of Senescence (Dr A E Needham), 579
Rate (Heating) Dependence of Thermo-stimulated Current Curves on (C G Clayton, J B Whittaker, G A Briggs and T G Kelly), 349
Rate Constant and Activation Energy in Solid State Reactions Definition of (W Gomes), 865
Rates of Emergence of Resistance Biological Spectrum of some New Tuberculostatic 1,3,4-Oxadiazolones with special reference to Cross-Resistance and (Prof A. E Wilder Smith and Hans Brodhage), 1195
Ratio (Primary Embryonal Sex), in Normal Pregnancies determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch Méhes), 476
Ratio (Segregation-) Advantage of Abnormal Haemoglobins (L N Went), 382
Ratio (Stopping-Power), for Cavity Ionization Chambers Measurement of (T E Burlin), 545
Ratnoff, O D (Webster, Dr M E , and) Role of Hageman Factor in the Activation of Vasodilator Activity in Human Plasma, 180
Rats Effects of the Sulphur Amino-Acids on the Vitamin A Content in Liver of (Tątsuo Koyanagi and Satoshi Odagiri), 168
  Effects of Thymectomy on the Resistance of, to Drowning and Histamine Stress (Dr A S Weltman and A M Sackler), 460
  Hypertensive Effects of Bradykinin in (H Croxatto and J Belmar), 879
  Modification of the Effects of an Amphetamine–Barbiturate Mixture by the Past Experience of (Dr Hannah Steinberg, Dr Ruth Rushton and Christine Tinson), 533
  Second-Generation Toxicity of Malathion in (Prof W Kalow and A Marton), 464
Rats exposed to X-Rays Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in (Dr M Quintiliani, M Boccacci and L Tentori), 573
Rats (Hypophysectomized) Failure of the Purified Growth Hormone to restore the Size of the Kidneys in (Dr T Astarabadi), 270
Rats (Infant) Interrelationship between Fat and Sugar Metabolism in (P Hahn, O Koldovsky, V Melichar and M Novak), 1296
Rats (Intact and Hypertensive) Effect of Monovalent Cations on the Blood Pressure of (I Bach, S Braun, T Gati, Prof J Sos and A Udvardy), 362
Rats (Intact and Hypophysectomized) Effect of Sheep Pituitary Extract on Hypercholesterolaemia in (Dr Russel M Barakat), 71
Rats (Tumour-bearing) Deiodination of Thyroxine-^{131}I in (J A Stein, M Anbar, S Guttman and N Ernst), 1303
Rats (Young) Generalized Skeletal Response on Local Trauma in, studied by means of ^{45}Ca-Metabolism (Dr Jaromír Kolař and Dr Arnošt Babicky), 1297
Rats and Mice (Laboratory) Feeding of Bamboo Flowers to (V Mahadevan, Dr S S Negi and O N Agarwala), 470
Raus, J (Link, F , and) Multiplication of Mouse-adapted Influenza Virus in Mouse Lungs after Infection with Very Low Doses, 478
Rausen, Dr A R , and others Genetical Evidence for Synthesis of Transferrin in the Foetus, 182
Raven, A M , and Robinson, K L Comparative Effects of Wet and Dry Feeding on the Utilization of Protein by Calves, 1256
Raven, Rev Charles E A Roman Catholic View of Evolution, *review*, 827
Raven, Dr D J (Earland, Dr C , and) Isolation of a Cystine Derivative from Silk, 1185
Raven, Ronald W (edited by) Cancer Progress, 1960, *review* by Dr F J C Roe, 298
Ravetz, J R A Short History of Science, *review*, 825
Raw, Dr F The Soil as an Environment for Animal Life (The Interdependence of the Soil and its Fauna), 316
Rawlins, F I G Sensation and Perception, *review*, 593
  Formal Logic in Retrospect, *review*, 693
  Inductive Probability, *review*, 695
  Psychical Research, *review*, 901
Ray, J C , and others Antigenic Structure of *Entamoeba histolytica*, 893
Ray, S K (Long, R , and) Inhibition of the Formation of 3,4-Benzpyrene during Hydrocarbon Combustion, 353
Raychaudhuri, Dr S P , and Bhattacharyya, Dr A K History of Sciences in Ancient and Medieval India (Agricultural Practices and Soil Science in Ancient India), 27
Rayleigh Scattering Lattice-like Vibrations in Associated Liquids and the Origin of Anomalous (J K Wilmshurst), 1061
  Tables related to Radiation emerging from a Planetary Atmosphere with (Kinsell L Coulson, Jitendra V Dave and Zdenek Sekera), *review* by Prof Zdenek Kopal, 1005
Rays (Cosmic) World-wide Distribution of Diurnal Variation of the Neutron Intensity of (Tsunekichi Kanno), 250
γ-Rays Effect of, on Thymus Nucleoprotein in Solution (Dr A R Peacocke and Dr B N Preston), 228
Rayski, Dr C , and Garden, E A Life-Cycle of an Acanthocephalan Parasite of the Eider Duck, 185
Re-Circulations of Chick Embryo Erythrocytes Number of (L Lemez and Z Rychter), 1298
Re-Educative Treatment of Suppression Amblyopia (Being an abridged English version of Jean Sedan's 'Post Cure de l'Amblyope Réeduque') (T Keith Lyle, Cynthia Douthwaite and Jill Wilkinson), *review* by Prof O L Zangwill, 695
Re-Evaluation based on Considerations of Chemical Structure Biosynthesis of Carotenoids in Purple Bacteria—a (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Re-Evaluation of some Factors in Arteriosclerosis (Dr Hans Kaunitz), 9
Re-Utilization of Protein-bound Amino-acids *in vivo* Quantitative Aspects of the (Dr H Walter and H Zipper), 1292
Reaction between Cuprous Oxide and Sodium Silicate A Coating with Antifouling Properties from the (J R Rischbieth and F Marson), 748
Reaction of the Decomposition of Lead Azide Kinetics of (Dr M Stammler, J E Abel and Dr R C Ling), 626
Reaction (Basophil) A New Test for Detecting Anaphylactic Sensitivity—the (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
Reaction (Guinea Pig and Rat Anaphylactic), *in vitro* Influence of Anaerobic Glycolysis on Release of Histamine in the (A Prouvost-Danon and Dr H Moussatche), 361
Reaction (Iso-immune), at the Surface of Ascites Tumour Cells Intracellular Response to an (D C Dumonde, Clarice M Walter, Lucille Bitansky, Prof G J Cunningham and J Chayen), 1302
Reaction (Thermal), between Two Light Reactions in Photosynthesis (Prof C P Whittingham and P M Bishop), 426
Reaction Silicon-29(n,α)Magnesium-26 at 14 MeV Neutron Energy (Dr W M Deuchars and G P Lawrence), 1278
Reactions (Fast) The Study of (Cambridge Physical Chemistry 1961 Summer School), 1136
Reactions (Fast), in Physical Chemistry (Dr W Gerrard), 1136
Reactions (Light), in Photosynthesis Thermal Reactions between Two (Prof C P Whittingham and P M Bishop), 426
Reactions (Solid State) Definition of Rate Constant and Activation Energy in (W Gomes), 865
Reactivation (Photo-) of Tobacco Mosaic Virus *in vivo* (D J Goodchild), 289
Reactor *Nora*, a New Zero Power (Norwegian Atomic Energy Institute), 918
Reactor Centrum Nederland *Atoomenergie en haar Toepassingen* (Atomic Energy and its Applications), Vol 3, No 6, 19
  High-flux Reactor at the Petten Research Centre, 708
Reactor Handbook (edited by C R Tipton, Jr), Vol 1, Materials, second edition, *review* by B W Mott, 100
Reactor (High-flux), at the Petten Research Centre of the Reactor Centrum Nederland, 708
Reactor (Nuclear) Stability (Dr A Hitchcock), *review*, 203
Reactors Materials for, *review* by B W Mott, 100
Read, Prof Clark P (Chandler, the late Prof Asa C , and) Introduction to Parasitology, with special reference to the Parasites of Man, tenth edition, *review* by Dr G Lapage, 488
Read, W W C (McLaren, Dr D S , and) An Unusual Major Fatty Acid Component in Human Depot Fat, 265
Reagent (Improved Benzidrine Sugar), for Paper Chromatograms (Bock G Chan and Prof J C Cain), 69
Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with Total Temperature to 10,000° K Mach Tables for (K L Goin), 308
Reception (Millimetre Wave Generation and) Non-Linear Transmission Lines for (Dr D Walsh), 1064
Receptors Muscle (University of Hong Kong Symposium on), 805
Receptors (Colicine) Nature of (Dr Anna Mayr-Harting), 191
Recherche Scientifique dans l'Industrie et l'Agriculture, Institut pour l'Encouragement de la (Bruxelles) Rapport Annuel Exercice (1960), 28
Reciprocals of the Integers from 1000 to 9999, with an Appendix on Mechanical Barrel-setting Calculators (T H Redding), *review* by Prof T A A Broadbent, 856
Recombination (Skewed), in a Rare Interspecific Jute Hybrid (Dr M S Swaminathan and R D Iyer), 893
Recording System (High-Speed Direct-), for Electron Diffraction (Dr C W B Grigson), 647
Records (Microbarograph), from the Russian Large Nuclear Explosions (E W Carpenter, G Harwood and T Whiteside), 857
Recovery Radiation Protection and (edited by Alexander Hollaender), *review* by Dr Hugh D Evans, 6
Recovery from Experimental Sendai Virus Infection Influence of Age of Mice on the (Dr Leon Sawicki), 1258
Recovery (Strain), in Wood Effect of Temperature on the (Maciej Lawniczak and Jan Raczkowski), 583
Recrystallization of Lead and Zinc Sulphides (Dr J C Nixon, J D Hayton, D C Lawrie and A E Tynan), 516
Rectifying Action of Non-uniform Fields in Dielectrics (Dr K C Kao), 650
Rectum Cancer of the (edited by Dr Cuthbert E Dukes), *review* by Dr Francis J C Roe, 197
Red Algae New Ninhydrin-Reactive Substance from (Mitsuo Kuriyama), 969
Red Blood Cell (Human) Metabolism of the (Dr D Mendelsohn), 619
Red Blood Cell Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep Relationships between (Prof J V Evans), 567
Red Blood Cells Agglutination and the Electrical Surface Potential of (P Sachtleven and Prof G Ruhenstroth-Bauer), 982
Red Blood Cells (Sheep) Utilization of, in the Haemadsorption Test for Myxoviruses (H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Red Cell Enzyme Deficiency Absence of, in Australian Aborigines (Prof O Budtz-Olsen and Dr Chev Kidson), 765

Red Cells Adenosine Diphosphate in, as a Factor in the Adhesiveness of Human Blood Platelets (A Gaarder, Dr J Jonsen, Prof S Laland, Dr A Hellem and Prof P A Owren), 531
  Effect of Quinones on the Uptake of Oxygen by (D Lovell and Dr T A J Prankerd), 561
  Thromboplastic Activity of (Prof Armand J Quick), 882 , (Dr James A Inglis and Dr June W Halliday), 882
Red Cells (Incubated Rat), *in vitro* Effect of Hydrocortisone on Uptake of Iron-59 in (Peggy Clark), 667
Red Clay on the Floor of the Atlantic Natural Glass from beneath (Dr G D Nicholls and V T Bowen), 156
Red Deer in Sweden, 30
Red Deer and other Species Serum β-Globulin Types in, and their Stability in the Presence of Bacteria (V P W Lowe and E I McDougall), 983
Red Shift The Galactic (Dr A Ward), 858
Red Spider (Fruit Tree) Evaluation of the Activity of some Diphenyl Compounds on Winter Eggs of the (J Meltzer), 474
Redding, T H Reciprocals of the Integers from 1000 to 9999, with an Appendix on Mechanical Barrel-setting Calculators, *review* by Prof T A A Broadbent, 856
Redistribution (Population), and Economic Growth, United States, 1870-1950 (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grebenik, 853
Redman, Prof R O The Natural History of Galaxies, *review*, 838
Reduction (Cell), in the Embryonic Development of the Cestode *Diorchis ransomi* Schultze, 1940 (Krystyna Rybicka), 771
Reduction (Polarographical), of some Carbonyl Compounds Role of Keto-Enol Tautomerism in the (Dr P Zuman and Dr J Michl), 655
Redundant (Non-) Stimulation Visual Effects of (Prof D M MacKay), 739
Reece, I H , and Werner, Prof R L At the Third Australian Spectroscopy Conference (Infra-red Studies on Hydrogen Bonding—Intermolecular Interaction between Carbonyl and Hydroxyl Groups in Solution), 927
Reed, R , and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Experiments to break the Insolubilizing Cross-links of Mature Bovine Collagen after Alkaline Pretreatment), 613
Rees, K R , and others Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from Rat Liver Nuclei, 171
Reese, Dr C B The Polynucleotide Field, *review*, 836
Regenerating Rat Liver Pituitary Effect on Synthesis of Deoxyribonucleic Acid in, following Whole-body X-Irradiation (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Regenerating Rat Liver (Normal and) Effects of Irradiation on the Incorporation of Amino-Acid into (Dr Nirmal K Sarkar, Dr Anima Devi and Dr Louis H Hempelmann), 179
Regeneration Evolution of, and its Possible Bearing on Philosophy (Dr R J Spilsbury), 1254 , (Dr A E Needham), 1255
Regeneration of Naked Yeast Protoplasts Physical Conditions as Important Factors for the (Dr O Nečas), 580
Regeneration (Leaf) Vacuolation and, in *Splachnum ampullaceum* (L) Hedw (Prof Kraft E von Maltzahn)—Formation of Secondary Vacuoles in De-differentiating Cells, 55 , Effect of Kinetin on Attached Leaf Regeneration, 56
Regeneration (Shell), in *Ariophanta* sp Effect of Ribonuclease on (K K Nair and P T Muthe), 674
Regeneration (Wound Tissue) Changes in the Concentration of Ribonucleic Acid during (Martin B Williamson and Wilhelm Guschlbauer), 454
Regional Research Laboratory, Hyderabad Symposium on Low Temperature Carbonization of Non-caking Coals and Briquetting of Coal Fines, 406
Regions of the Central Nervous System of the Rat Distribution of Ribonucleic Acid in Subcellular Fractions of various (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
Regions (Heart Dipole), and the Measurement of Dipole Moment (Dr M R Barber and Dr E J Fischmann), 141
Regulation (Chloride), in *Triops* (Gwyneth Parry), 468
Reid, Prof D D The Vehicle Driver, 1245
Reid, Leslie Teaching Machines, 106
Reindeer Blood and Serum Groups in, compared with those in Cattle (Bo Gahne and Jan Rendel), 529
Rejniak, Leopold, and Komczynski, Prof Ludvik Behaviour of Protozoa under the Influence of the Synergetic Action of Polyethylene Glycol and Dyes, 1203
Related (Closely) Antigens in Human Placenta and Kidney (Dr Raymond William Steblay), 1259
Relation to Albumin Binding Antigenicity of Penicillin and its (Dr Toshio Torii and Dr Yoshihi Kohoriuchi), 429
Relation between Organophosphorus-Resistance and Non-Diapause in Spider Mites (W Helle), 1314
Relation (Possible), to Mutagenic Properties of Alkylating Agents Acidic Dissociation of 7 9-Dialkylguanines and its (Dr P D Lawley and P Brookes), 1081
Relations (Sun–Earth), and Associated Periodicities (Irvine Paghis), 346
Relationship between Deposition of Long-lived Fission Products and Level of Activity in Milk Analysis of the (Dr W Anderson, L K Burton and J O Crookall), 1009
Relationship between 3,4-Dihydroxyphenylethylamine Content and the Genome, *acuminata* (L A Griffiths), 84
Relationship between Oxidation of Isocitrate and Metabolism of Fatty Acids in Rabbit-Heart Sarcosomes (Dr W C Hulsmann), 1153
Relationship between Phage Type and Host Plant in *Pseudomonas morsprunorum* Wormald (J E Crosse and Constance M E Garrett), 379
Relationship between Tissue Eosinophils and Peroxidase Activity (Tapio Rytomaa and Prof Harald Teir), 271
Relationships between Red Blood Cell Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in Merino and Southdown Sheep (Prof J V Evans), 567
Relationships (Moisture Expansion), for a Fired Kaolinite-Hydrous Mica—Quartz Clay (Dr W F Cole), 737
Relationships (Nutritional), of Fishes Mathematical Theory of, *review* by L Birkett, 297
Relationships (Serological), between the Nine-spined and the Three-spined Stickleback (Tadeusz Penczak), 673
Relaxation Magnetic and Electric Resonance and (Netherlands Physical Society and the *Groupement Ampere* International Conference on), 213
Relaxation Enhancement by Paramagnetic Ion Binding in Deoxyribonucleic Acid Solutions (J Eisinger, R G Shulman and W E Blumberg), 963
Relaxation (Contraction–) Extendability of Tendons undergoing (Dr H R Elden and G Webb), 742
Relaxation (Fundamental), of Classical Oscillators (Michael Hoare), 63
Release of Histamine in the Guinea Pig and Rat Anaphylactic Reaction *in vitro* Influence of Anaerobic Glycolysis on (A Prouvost-Danon and Dr H Moussatché), 361
Release of Noradrenaline from the Spleen of the Cat by Acetylcholine (K W Brandon and Helen Boyd), 880
Removal by Gibberellic Acid Induction of a Light Requirement for the Germination of Lettuce Seed by Naringenin, and its (Dr I D J Phillips), 240
Renal Cells (Frog) Cultivation of Monolayer Cultures of (Dr Walter Auclair), 467
Renal Collecting Tubules Antidiuretic Hormone and (Paul Breddy, Grahame F Cooper and Dr Jeffrey M N Boss), 76
Renal Tubular Amino-Acid Transport System (New), and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
Rendel, Jan (Gahne, Bo, and) Blood and Serum Groups in Reindeer compared with those in Cattle, 529
Rendon, Orlando, and others Culture of Human White Cells using Differential Leucocyte Separation, 1214
Renfrew, A , and Morgan, Philip (edited by) Polythene, the Technology and Uses of Ethylene Polymers, second edition, *review* by Prof C E H Bawn, 837
Rennie, J , and Smith, W Formation of Air–Water Froths, 419
Repetitive After-discharge produced by Drugs in Nerves treated with Cetyltrimethylammonium Bromide (Michiko Okamoto and Prof Albert S Kuperman), 365
Replacement of an Alternating Temperature Requirement for Germination by Gibberellic Acid (J M Tager and Brenda Clarke), 83
Representations of Primes by Quadratic Forms (prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta), (edited by J C P Miller), (Royal Society Mathematical Tables, Vol 5), *review* by Prof C A Coulson 97
Reprints Mathematical (Chelsea Publishing Co , New York), 114
Reproduction of Tick-borne Encephalitis Virus in HeLa Cells (Dr H Libikova and Dr P Albrecht), 779
Reprographic Technology, Institute of Inauguration of the, 919
Requirement of Essential Fatty Acids and Avian Atherosclerosis (H Fisher, A S Feigenbaum and H S Weiss), 1310
Requirement (Alternating Temperature), for Germination Replacement of an, by Gibberellic Acid (J M Tager and Brenda Clarke), 83
Requirement (Growth), for Four Soil Amoebae Biotin, a (R N Band), 674
Requirement (Light) Induction of a, for the Germination of Lettuce Seed by Naringenin, and its Removal by Gibberellic Acid (Dr I D J Phillips), 240
Requirements of an Ice Nucleus (G R Edwards and L F Evans), 448
Requirement (Nutritional), for the Induced Formation of Malic Enzyme in *Lactobacillus arabinosus* (17-5), (Sheila M Bocks) 89
Requirements (Solute), for Preventing Lysis of some Marine Bacteria (Prof Robert A MacLeod and Tibor Matula), 1209
Research Building (R Paul Johnson), 809
  Control of Government Expenditure on, 485
  Co-operation in, 785
  Fire, 1960—Report of the Fire Research Board with the Report of the Director of Fire Research (Department of Scientific and Industrial Research and Fire Offices' Committee Joint Fire Research Organization), 1250
  Psychical, *review* by F I G Rawlins, 901
  Safety in Mines, 709
Research Experimental Eye, Vol I, No I, 1240
Research on Agriculture Medal and Award for (Royal Agricultural Society of England), 609
Research on the Chemotherapy of Virus Diseases (Fine Chemicals Group of the Society of Chemical Industry Discussion on), 806
Research in the Leather Industry (R G Mitton), 612
Research in Nuclear Science National Institute for Appointment of Dr J Howlett as head of the *Atlas* Computer Laboratory, 918
Research in Shipbuilding, 919
Research on Tropical Anaemias Grants for (Wellcome Trust), 211
Research with Tropical Plants, 418
Research in the Universities (Rt Hon Viscount Hailsham), 787
Research (Agricultural), Indian Council of Entomological Monographs No I, Contributions to the Systematics of Oriental Termites (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Research (Building) Board Annual Report for 1960 (Department of Scientific and Industrial Research), 809
Research (Cancer) Progress in, *review* by Dr F J C Roe, 298
  Progress of (D G Arnott, Dr I Hieger and A L Levene), 1251
  Sixteenth Annual Symposium on Fundamental—Conceptual Advances in Immunology and Oncology (University of Texas), 1132
Research (Cancer), in the University of Perugia Medical School (Prof Lucio Severi), 217
Research (Clinical) Senior Research Fellowships in (Wellcome Trust), 1026
Research (Cosmic Ray), in Latin America (Dr H Elliot), 121
Research (Cosmic Ray), Latin-American Council for Third Latin-American Conference and Course on Cosmic Ray Physics, 121
Research (Dairy), in Australia, 1131
Research (Forest) Organizations, International Union of Thirteenth Congress (F C Ford-Robertson), 614
  Election of Officers, 615
Research (Fundamental), in Plastics Fellowships in Engineering Study and (Princeton University), 921
Research (Geological and Geographical), in the U S S R , 114
Research (Ionospheric), during the International Geophysical Year, *review* by A F Wilkins, 840
Research (Medical) Gas Chromatography in (Gas Chromatography Discussion Group of the Institute of Petroleum Symposium on), 717
Research (Medical), Fleming Memorial Fund for Grant of £48,000 to the University of Oxford, for the Sir William Dunn School of Pathology, 404

Research (Medical), South African Institute for Publications, No 1, Vol 9, The Arthropod Parasites of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol 1, Chelicereta (edited by F Zumpt), *review* by Dr F A Turk, 1222
Research (Medical), in the British Caribbean, Standing Advisory Committee for Sixth Scientific Meeting, 26
Research (Medical), and the National Institutes of Health, Bethesda, Maryland (Dr Carl R Brewer), 791
Research (Natural Rubber) Conference Proceedings of the (Kuala Lumpur 1960), (sponsored by the Rubber Research Institute of Malaya, with the support of the Government of the Federation of Malaya and the Rubber Producers' Council of the Federation of Malaya), *review* by Dr W F Watson, 491
Research (Neurophysiological) Probability Distribution Analyser programmed for (Dr W R Levick, Prof P O Bishop, W O Williams and Prof D G Lampard) 629
Research (Nuclear), European Organization for See *under* CERN
Research (Psychical) William James on (compiled and edited by Gardner Murphy and Robert O Ballou), *review* by F I G Rawlins, 901
Research (Scientific) Current Trends in (Prof Pierre Auger), *review* by R Brightman 850
Research (Scientific), in Australia, 307
Research (Scientific), in New Zealand, 713
Research (Scientific), in Industry and Agriculture, Institute for the Encouragement of (Brussels) Annual Report for 1960, 28
Research (Space) Russian, 19
Research (Water) Association New Research Station, 803
Research (Water Pollution), in Great Britain (F E Bruce), 711
Research (Wool) Colloquium No 1, Wool Structure (Australian Commonwealth Scientific and Industrial Research Organization), 709
Research and Development Control of Government Expenditure on (House of Commons Debate on), 1239
Research and Development in the Gas Industry, 306
Research and Development in Industry Funds for, 1958 (United States National Science Foundation, Surveys of Science Resources Series, NSF 61-32), 809
Research and Development (Industrial), in the United States, 809
Research and Development (Metallurgical) Symposium on Pilot Plants in, held at the National Metallurgical Laboratory, Jamshedpur, 1960 (edited by R M Krishnan), *review* by E W Voice, 1008
Research and Education in Physics (International Atomic Energy Agency, Unesco and the Central Committee for Swedish Technical Assistance International Seminar on), 709
Research Activities in the Antarctic United States, 919
Research Council (British Columbia) Seventeenth Annual Report, 516
  Grant of 10 000 dollars a year from the Canadian Uranium Research Foundation, for investigation into the use of uranium compounds as toxicant additives to wood impregnants for marine borers, 516
Research Fellowships and Research Studentships Senior Research Fellowships (Zoological Society of London), 211
Research Fellowships (Senior), in Clinical Research (Wellcome Trust), 1026
Research Fellowships (Senior), of the New Zealand Department of Scientific and Industrial Research awarded to Dr B H Howard and to Dr R Melville, 210
Research Fellowships (Senior) Research Fellowships and Research Studentships (Zoological Society of London), 211
Research Grants in Science and Medicine in Canada, 308
Research Institute (Animal Virus Diseases), Pirbright Report for 1956-1960, 714
Research Laboratories (Pharmaceutical and Allied) Radioactivity for—a Symposium sponsored by Nuclear Sciences and Engineering Corporation (edited by Abraham Edelmann), *review* by Dr Hugh D Evans, 6
Research Laboratory (Regional), Hyderabad Symposium on Low Temperature Carbonization of Non-caking Coals and Briquetting of Coal Fines, 406
Research Scholars (Science) of the Royal Commission for the Exhibition of 1851 (1891-1960) Record of the, 1240
Research Scholarships in Electrical Engineering or Physics (British Broadcasting Corporation), 115
Research Studentships Senior Research Fellowships Research Fellowships and (Zoological Society of London), 211
Reserpine Antagonism of by Intraventricular Bretylium (Stata Norton and Kenneth I Colville), 72
Reserpine and its *N*-Oxide Radioprotective Effects of (Dr Thomas J Haley, A M Flesher and L Mavis), 1309
Reserpine-induced Circulatory Failure (Prof Eleanor Zaimis) 521
Resistance Biological Spectrum of some New Tuberculostatic 1 3,4-Oxadiazolones with special reference to Cross-Resistance and Rates of Emergence of (Prof A E Wilder Smith and Hans Brodhage) 1195
Resistance of Rats to Drowning and Histamine Stress Effects of Thymectomy on the (Dr A S Weltman and A M Sackler), 460
Resistance of Varieties of Cocoa to Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl Probable Mechanism of (Dr John A Spence), 278
Resistance (Organophosphorus-) and Non-Diapause in Spider Mites Relation between (W Helle), 1314
Resistivity (High-) Gallium Arsenide Energy-Level Model for (J Blanc and L R Weisberg), 155
Resolution of Pathological Human Gamma-Globulins by Starch-Gel Electrophoresis (J P Binette and K Schmid), 732
Resonance Electron Spin (Chemical Society Symposium on), 1034
Resonance (Electron Paramagnetic), and Antiferromagnetism in $LaCrO_3$ (L Weinberg and P Larssen), 445
Resonance (Magnetic and Electric), and Relaxation (Netherlands Physical Society and the *Groupement Ampere* International Conference on), 213
Resonance Phenomenon (Triple), in Plasmas (T J Bellanca, Prof R S Elliott and J J Erlinger), 543
Resonance Signals (Electron-Spin), from Lyophilized Bacterial Cells exposed to Oxygen (Dr M B Lion, Dr J S Kirby-Smith and Dr M L Randolph), 34
Resonance Spectroscopy (Nuclear Magnetic) of Proteins—the Hydrogen Bonding of Water in Bovine Serum Albumin Solutions (F A Bovey), 324
Resources (The Mineral), of Uganda (compiled and edited by Dr J W Barnes), 921
Resources (Natural) Role of Science in the Development of, with particular reference to Iran, Pakistan and Turkey (Scientific Council of the Central Treaty Organization Symposium on), 609
Respiratory Chain Phosphorylation in Sub-Cellular Particles isolated from the Hepatopancreas of *Carcinus maenas* (Dr R B Beechey), 975
Response of Catfish Barbels to Taste Stimuli (Hideki Tateda), 343
Response of Chloroplast Cytochromes to Light and Substrates (Prof H Lundegårdh), 243
Response of the Reticulo-Endothelial System to Stimulation with Œstrogens (Prof T Nicol, D L J Bilbey, J Cordingley and C Druce), 978
Response (Generalised Skeletal), on Local Trauma in Young Rats studied by means of ^{45}Ca-Metabolism (Dr Jaromir Kolař and Dr Arnošt Babicky), 1297
Response (Intracellular), to an Iso-immune Reaction at the Surface of Ascites Tumour Cells (D C Dumonde, Clarice M Walter, Lucille Bitensky, Prof G J Cunningham and J Chayen), 1302
Response (Motor), of the Isolated Guinea Pig Vas Deferens to Hypogastric Nerve Stimulation Effect of some Smooth Muscle Stimulants on the (Dr Nils O Sjostrand), 1190
Response (Rocking), of *Automeris* Effect of Pupal Brain Surgery on the (Dr A D Blest), 373
Responses of Dwarf Groundsel to Gibberellic Acid Effect of Environment on the (K H Basford), 992
Restriction to Diffusion of Macromolecules A Cell for Rapidly Measuring, through Agar Gels of various Pore Sizes (G K Ackers and R L Steere), 436
Result of Buoyancy Effects Vortex Shedding from the End of a Tube as a (A A Putnam), 1277
Results (Ionospheric), obtained during the International Geophysical Year Some—Proceedings of a Symposium organized by the U R S I /A G I Committee, at Brussels, 1959 (edited by W J G Beynon), *review* by A F Wilkins, 840
Retention (Sulphate), by Acid Soils Nature of (Monica Liu and G W Thomas), 384
Retention Factors (Group), in the Gas–Liquid Chromatography of Steroids (R B Clayton), 524
Reticular Formation Effects of Electrical Stimulation of, on the Lactic Acid Content of the Rat Brain (Dr Lj Mihailović, Lj Krzalic and D Cvetkovic), 1166
Reticulo-Endothelial System Response of the, to Stimulation with Œstrogens (Prof T Nicol, D L J Bilbey, J Cordingley and C Druce), 978
Retinene-I in Insect Tissues (Michael H Briggs), 874
Retrospect Formal Logic in, *review* by F I G Rawlins, 693
Revans Prof R W At the twenty-seventh Conference of the International Federation for Documentation (Documentation of Management) 219
Reversal of Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine for *Candida albicans* by Pyridoxine and Pyridoxamine (Dr M L Littman and Dr T Miwatani), 1155
Reversible Solid-State Transformation (A New), in Iron–Nickel Alloys in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavley), 962
Reversion in *T4rII* Bacteriophage to r^+ induced by Ultra-Violet Irradiation Detecting (Prof C E Folsome and D Levin), 1306
Revesz L (Solymosi, Dr F , and) Thermal Decomposition of Ammonium Perchlorate in presence of Zinc Oxide, 64
Revision of School Science Curricula, 307
Reynolds, Dr G F Appointed reader in analytical chemistry at the Loughborough College of Technology, 115
Reynolds, Prof S R M Sensory Deprivation and Foetal Circulatory Homeostasis, 818
Rhamnose from Rabbit Skin Isolation and Identification of (Ina Malawista and Prof E A Davidson), 871
Rheological Equipment Exhibition of (Cambridge Rheology Club), 308
Rheology, Society of Transactions of the, Vol 5, 1951 (edited by E H Lee), *review* by Dr G W Scott Blair 1008
  Bingham Medal for 1960 awarded to Dr B H Zimm, 1008
Rheology Club (Cambridge) Exhibition of Rheological Equipment, 308
Rhizobium on Clover Seeds Survival of (J F Loneragan, D V Moye and A J Anderson), 526
Rhizobium meliloti Survival of, in Soil Culture (H L Jensen), 682
Rhodes, A , and others Venturicidin, a New Antifungal Antibiotic of Potential Use in Agriculture, 952
Rhodes, Prof F H T Chitinozoa from the Ordovician Nod Glas Formation of Merioneth, 275
Rhodesian (Northern) Copper Deposits Origin of the, *review* by Prof J H Taylor, 98
Rhodesian (Northern) Copperbelt The Geology of the (edited by Dr F Mendelsohn), *review* by Prof J H Taylor, 98
Rhodium (23 per cent) Hydrogen Overvoltage at Cathodes of 77 per cent Palladium and (J C Barton and Dr F A Lewis), 549
Rhodopseudomonas capsulatus and *Azotobacter vinelandii* Production of Slime Substance in Mixed Cultures of (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Rhubarb Petioles Auxin Activity in Ether-insoluble Fractions of Extracts of (B E S Gunning), 661
Ribeiro, L P , and others Paper Electrophoresis, *review* by Dr G V F Seaman, 593
Riboflavin Effect of, on Liver Histomucoid (Luiz A Abreu and R Raposo Abreu), 261
  In vivo and *in vitro* Inhibition of Aromatic Hydroxylation by (K H Harper and Dr G Calcutt), 165
Riboflavin and Liver Sulphydryl-Levels in Mice (Dr G Calcutt, D Doxey and Joan Coates), 164
Ribonuclease Effect of, on Shell Regeneration in *Ariophanta* sp (K K Nair and P T Muthe), 674
Ribonuclease (Deoxyribonuclease and) Action of, on the Growth of Ehrlich Ascites Carcinoma in Mice (Dr Gaston de Lamirande), 52
Ribonuclease (Deuterated) Crystallization of (Dr J Bello and Dr D Harker), 756
Ribonucleic Acid Changes in the Concentration of, during Wound Tissue Regeneration (Martin B Williamson and Wilhelm Guschlbauer), 454
  Distribution of, in Subcellular Fractions of various Regions of the Central Nervous System of the Rat (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456

Ribonucleic Acid Biosynthesis Manner of expressing Rate of (D G Fraenkel and F C Neidhardt), 677
Ribonucleic Acid (Soluble) Conservation of the Biological Activity of a (J H Weil, Prof J P Ebel and R Monier), 169
Ribonucleoprotein Two Types of, in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Rice Soils (Australian) Nitrogen-fixing Blue-Green Algae in (Dr J S Bunt), 479
Ricerche, Consiglio Nazionale della Monografie Matematiche, 7, Lectures on Modern Geometry (Prof Beniamino Segre), *review* by L Roth, 847
Richards, Prof E J Astronautics (Some Problems of Noises in Ballistic Missiles), 312
Richards, Prof E J Astronautics (Some Problems of Noises in Ballistic Missiles), 312
Richards, E W T, and others Nuclear Spin of Protoactinium-231 from Hyperfine Splitting, 444
Richards, J P (Harris, N D, and) Influence of Adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on Membrane Filters, 87
Richards, Dr J R (Evernden, Dr J F, and) Potassium–Argon Ages at Broken Hill, Australia, 446
Richards, Prof O W Insect Polymorphism, 412
Richards, Dr T C Interpretation of Geophysical Surveys, 1244
Richards, W J Resignation as director of the Royal Radar Establishment, 18, work of, 18
Richardson, D N, and others Non-steriod Inhibitors of Pituitary Gonadotrophic Function, 1191
Ricketts, Dr C R (Maycock, Dr W d'A, and) Stability of Dextran during Prolonged Storage, 174
Rickettsia-like Micro organisms (Intracellular), in certain Ticks (M A Roshdy), 186
Riddiford, Dr L Appointed senior lecturer in the Department of Physics in the University of Birmingham, 406
Rideal, Sir Eric Colloids (Colloid Science—a Century of Progress), 930
Ridgeley, A, and others Nuclear Spin of Protoactinium-231 from Hyperfine Splitting, 444
Rieband, Dr F Appointed lecturer in the Department of Mechanical Engineering in the University of Birmingham, 507, 1241
Riegels, F W (schriftlietung) Ludwig Prandtl Gesammelte Abhandlungen zur Angewandten Mechanik, Hydro- und Aerodynamik (herausgegeben von Walter Tollmien, Hermann Schlichting und Henry Gortler), Teile 1-3, *review* by M James Lighthill, 841
Riemann Surfaces (Prof Lars V Ahlfors and Prof Leo Sario), *review* by Prof W K Hayman, 847
  Analysis on, *review* by Prof W K Hayman, 847
Riemann Zeta Function Tables of the (C B Haselgrove, in collaboration with J C P Miller), (Royal Society Mathematical Tables, Vol 6) *review* by Prof C A Coulson, 97
Rietveld, H M, and others X-Ray and Neutron Diffraction Examination of *p*-Diphenylbenzene, 154
Rig (Test) Solid Propellant Rocket Motor (P A Hilton and Co), 608
Rigal, Dr W M Uptake and Incorporation of Tritiated Thymidine in *in vitro* Culture, 768
Rinderpest Virus (Lapinized) Transmission of, by Contact between Rabbits (Dr G R Scott and C S Rampton), 289
Ring, Richard A, and others Intestinal Proteinases in an Insect, *Calliphora vomitoria* L, 999
Ring System (Porphyrin) Detection of Carboxyl Groups in Conjugation with the (P S Clezy), 750
Ringbom, A Microchemical Techniques (Value of Photometric Titrations for Metal Ions present in Small Amounts or at extremely Low Concentrations), 411
Ringnes, T S Secular Variations of Short-lived Sunspots, 151
Rings Normed (M A Naimark), translated from the first Russian edition by Leo F Boron, *review* by Dr F Smithies, 201
Riometer Observations during a Solar Eclipse (M A Gordon), 249, *erratum*, 1132
Rischbieth, J R, and Marson, F A Coating with Antifouling Properties from the Reaction between Cuprous Oxide and Sodium Silicate, 748
River (Mackenzie) Delta Effect of a Lake on Distribution of Permafrost in the (G H Johnston and R J E Brown), 251
River-Names The Grayling Fish and (John Tutin), 1102
Riviere, M At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (John Arthur Wilson Memorial Lecture), 613
Roadside Planting Ornamental Trees for Garden and (S A Pearce), *review* by F P Knight, 852
Robertson Dr G B Crystal and Molecular Structure of Diphenyl (August 5, 593), *erratum*, 1026
Robertson, Dr G B and others Eight-Co-ordinate Diarsine Complexes of Quadrivalent Metal Halides, 222
Robertson, Prof H P *Obituary* by Prof A H Taub, 797
Robertson Dr Randal M Appointed associate director (research) of the United States National Science Foundation, 922
Robertson Prof R N, and others Electrolytes and Plant Cells, *review* by Dr James F Sutcliffe, 831
Robinson, Rev J Priests and People, *review*, 102
Robinson, K L (Raven A M, and) Comparative Effects of Wet and Dry Feeding on the Utilization of Protein by Calves, 1256
Robinson, Sir Robert Chemistry in the Service of Medicine, 1018
Robinson, S J (Hargrave, P, and) Microwave Measurement Techniques (Equipment for Instantaneous Impedance Measurement), 409
Robinson, Prof T J (Lindsay, D R, and) Œstrous-inducing Activity of Testosterone in the Ewe, 761
Robson, Prof H N (Kinlough, M A, and) Chromosome Preparations obtained directly from Peripheral Blood, 684
Rocha e Silva, M, and others A Micromethod for the Determination of Bradykininogen in Blood Plasma, 1194
Rockefeller Foundation The President's Review from the Annual Report, 1960 (G J Harrar), 587
Rocket Motor Test Rig Solid Propellant (P A Hilton and Co), 608
Rocket Propulsion Thirty Years Ago (Paul Adorian), reprint, 308
Rocket Society (American) Spaceflight Report to the Nation, 1244
Rocking Response of *Automeris* Effect of Pupal Brain Surgery on the (Dr A D Blest) 373
Rocks in the Lizard (Cornwall) Area Age Determinations of (J A Miller and D H Green), 1175
Rocks (British Cambrian) Differential Secondary Magnetization in some (D E T Bidgood), 39
Rocks and Minerals used by the British Ceramic Industry (Exhibition of, at the Geological Museum, London), 21
Roden, Lennart, and others Rapid Preparation of Fluorescent Antibodies using Gel-Filtration, 182
Rodger, Prof Alec Occupational Versatility and Planned Procrastination (Inaugural Lecture at Birkbeck College, London), 607
Roe, Dr Francis J C Cancer of the Rectum, *review*, 197
  Progress in Cancer Research, *review*, 298
Roels, H (Brañez, E, and) Variations in the Nuclear Deoxyribonucleic Acid Content in the Adrenal Cortex of the Female White Rat during the Œstrual Cycle, 1043
Rogasch, P E At the Third Australian Spectroscopy Conference (Infra-red Studies on Hydrogen Bonding—Proton Transfer can occur in Systems that are Strongly Hydrogen-bonded), 927
Rogasch, P E (Drummond, L J, and) At the Third Australian Spectroscopy Conference (Spectral Characteristics of the Emission from Active Nitrogen–Chloroform and Active Nitrogen–Methylene Chloride Flames), 928
Rogers, Dr M A T At the twenty-seventh Conference of the International Federation for Documentation (Scientific and Technical Information), 219
Rogoff, Martin H, and Wender, Irving Biologically Active Materials in Coal, 378
Role of Cell Division in Gastrulation of the Viviparous Toothcarp *Xiphophorus helleri* (Prof A Stolk), 374
Role of Experience in Misreaching produced by Visual Cortex Lesions (A Cowey and Dr L Weiskrantz), 1319
Role of Hageman Factor in the Activation of Vasodilator Activity in Human Plasma (Dr M E Webster and O D Ratnoff), 180
Role of Immunization in Communicable Disease Control (United Nations World Health Organization, Public Health Papers No 8), 20
Role of Keto-Enol Tautomerism in the Polarographical Reduction of some Carbonyl Compounds (Dr P Zuman and Dr J Michl) 655
Role of Science in the Development of Natural Resources with particular reference to Iran, Pakistan and Turkey, (Scientific Council of the Central Treaty Organization Symposium on), 609
Role of Stenosis of the Extracranial Cerebral Arteries Cerebral Infarction—the (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Role of the Thymus in Polysaccharide Metabolism (G Csaba, G Toth, Prof I Toro, Th Ács and L Csaki), 1304
Role of Water-regulating Mechanisms in Amphibian Morphogenesis—a Quantitative Hypothesis (Peter Tuft), 1049
Rolt, W F, and others Effect of Copper Deficiency in White Clover on Nitrogen Fixation, 1315
Roman, Dr P Introduction a l'Électrodynamique Quantique, *review*, 1111
Roman Catholic View of Evolution, *review* by the Rev Charles E Raven, 827
Romney Ewes Fibre Follicles in (Dr A B Wildman), 997
Rontgenstrahlinterferenzen (Max von Laue), *review* by Prof H Lipson, 854
Room, Prof T G Elected president of the Australian Mathematical Society, 114
Roonwal, M L, and Sen-Sarma, P K Contributions to the Systematics of Oriental Termites, *review* by W V Harris, 851
Root-Growth Activity of Deoxyribonuclease as related to (Dr R Goutier and M Goutier-Pirotte), 371
Root-Pressures in Palms High (T A Davis) 277
Rootes, D G, and others Limitations of the Periodic Acid–Schiff Technique for the Demonstration of Stages of *Eimeria* in Tissues, 1315
Rooting (Adventitious) Structure of the Plant Stem in relation to (A Beryl Beakbane), 954
Roots (Excised Cotton) Biosynthesis of Gossypol by (Prof F H Smith), 888
Roots (Plant) Effect of Plant Growth Compounds on Uptake of Amino-Acids by (D E Wright), 1044
Roots (Tomato) Effect of Water Movement on Salt Movement through (William Lopushinsky and Paul J Kramer), 994
Rootstock Influence on the Flowering of Seedling Apples (H M Tydeman), 83
Rorsman, Dr Hans (Fregert, Dr Sigfrid, and) Allergy to a Carbon-Functional Organic Silicon Compound Dimethyldi-(4-hydroxyphenyl)-silane, 989
Rosa, Prof C G, and Tsou, Kwan-Chung Use of Tetrazolium Compounds in Oxidative Enzyme Histo- and Cyto- Chemistry, 990
Rosbaud, Dr P Awarded the John T Tate Medal of the American Institute of Physics, 112, work of, 112
Rose, C H Rheological Equipment (The Dye Dilution Curve Recorder), 308
Rose, Dr F L Chemistry in the Service of Medicine (Origin and Rise of the Synthetic Drugs), 1019
Rose G, and others Round-the-World Sound Waves produced by the Nuclear Explosion on October 30, 1961, and their Effect on the Ionosphere at Sodankyla, 1173
Rose, Dr H E Title of professor of powder technology (at King's College, London) conferred on, 1132
Rosenberg, Leon E and others Paradoxical Effect of Phlorizin on Glucose Uptake and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro*, 1085
Rosenblatt, Dr M G, and others Effect of Aldosterone on the Living Cornea *in vitro* 73
Rosenfeld, Sheldon, and others Plasma Albumin Catabolism in Experimental Nephrosis, 562
Rosenhead, Prof L The New Mathematics and Oceanography Building of the University of Liverpool, 1133
Roshdy, M A Intracellular *Rickettsia*-like Micro-organisms in certain Ticks 186
Ross, Hazel F, and others Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from Rat Liver Nuclei, 171
Ross, Dr I G At the Third Australian Spectroscopy Conference (Optical Masers), 928
Ross, Dr I G (McCoy, E F, and) At the Third Australian Spectroscopy Conference (Change of Shape in Electronic Transitions of Polycyclic Aromatic Hydrocarbons) 927

- Rotation (Lattice), at Slip Band Intersections (Dr A S Argon and Prof E Orowan), 447
- Rotation Viscometers and their Application to Non-Newtonian Measurements (Dr R McKennell), 308
- Rotational Analysis of ^{45}Cu^{35}Cl Bands (Prof R K Asundi, P Ramakoteswara Rao and J K Brody), 444
- Rotational Analysis of the $A^2\Pi$–$X^2\Sigma^+$ System of MgCl (E Morgan and Dr R F Barrow), 1182
- Roth, Franklin E, and others A Non-diuretic Benzothiadiazine with Antihypertensive Properties, 176, *erratum*, 802
- Roth, L Modern Geometry, *review*, 847
- Roth, Dr N, and others Growth Hormone Content of Serum in Infants, Children, Adults and Hypopituitary Dwarfs, 1051
- Rothamsted Experimental Station Promotion of Dr B Kassanis to Senior Principal Scientific Officer, 215
  - Promotion of Dr A Kleczkowski to Senior Principal Scientific Officer, 215
- Rothschild, Jennifer, and Howden, Dr G F Effect of Chlorinated Hydrocarbon Insecticides on Insect Choline Acetylase, Condensing Enzyme and Acetylkinase, 283
- Rough Dwarf Virus (Maize) Accumulation of Asparagine in Maize Plants infected by, and its Significance in Plant Virology (Dr I Harpaz and S W Applebaum), 780
- Round-the-World Sound Waves produced by the Nuclear Explosion on October 30, 1961, and their Effect on the Ionosphere at Sodankyla (G Rose, J Oksman and E Kataja), 1173
- Rous Sarcoma Cells Ultrastructural Alterations during the Crabtree Effect in (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
- Rous Virus Inactivation of, by Phospholipase *A* (H A Drayton), 896
- Rowett Research Institute, Aberdeen Grant of £10,500 from the Wellcome Trust, for the purchase of new radiographic equipment, 212
- Rowland, G F, and others Incorporation of ^{14}C-Glycine by Sub-Nuclear Preparations from Rat Liver Nuclei, 171
- Rowlands, Dr I W Appointed by the Zoological Society of London as Senior Research Fellow in reproductive physiology, 211, work of, 211
- Royal Agricultural Society of England Medal and Award for research on Agriculture, 609
- Royal Aircraft Establishment, Farnborough Promotion of Prof J C Cooke to Senior Principal Scientific Officer, 214
  - Promotion of R J Atkinson to Deputy Chief Scientific Officer, and head of the Structures Department, 306
- Royal Astronomical Society and the Geological Society Geophysical Discussion on the Interpretation of Geophysical Surveys, 1242
- Royal Commission for the Exhibition of 1851 Eleventh Report, 1239
  - Record of the Science Research Scholars (1891-1960), 1240
- Royal Dutch Institute of Engineers (Society of Instrument Technology and the) Joint Conference on Measurement and Control Technology, 1241
- Royal Entomological Society Symposium on Polymorphism in Insects, 412
- Royal Free Hospital School of Medicine, London Appointment of J C G Coleridge as reader in physiology, 1132
- Royal Greenwich Observatory Promotion of B E J Pagel to Senior Principal Scientific Officer, 214
  - Changes in Times of International Time Signal, 1023
- Royal Institute of Chemistry Atmospheric Photochemistry (Sir Harrie Massey and Dr A E Potter), 213
  - A Chemist's Introduction to Statistics, Theory of Error and Design of Experiment (Dr D A. Pantony), 213
  - Recent Developments in Polarography (Dr G W C Milner), 213
  - Meldola Medal for 1961 (Society of Maccabaeans), 309
  - Summer School in Analytical Chemistry at the Manchester College of Science and Technology, 608
- Royal Institution Christmas Lectures by Sir Lawrence Bragg (Electricity), 1026
- Royal Institution of Naval Architects Denny Scholarship in Marine Engineering (1961) awarded to David K Brown, 309
  - Parsons Scholarship in Marine Engineering (1961) awarded to Alan B Turner, 309
- Royal Medal of the Royal Society awarded to Prof C F Powell, 707, 905
- Royal Medal of the Royal Society awarded to Sir Wilfrid Le Gros Clark, 707, 906
- Royal Meteorological Society Symposium on Winds and Circulation in the Upper Atmosphere, 12
  - Symposium on Medium Range Diffusion in the Atmosphere, 13
- Royal Military College of Science, Shrivenham Promotion of Dr G B Preston to Senior Principal Scientific Officer, 214
- Royal Ontario Museum New Mineral and Gem Gallery, 607
- Royal Radar Establishment Resignation of W J Richards as director, 18
  - Appointment of Dr G G Macfarlane as director, 18
  - Promotion of Dr A F Gibson to Deputy Chief Scientific Officer, 214
- Royal Scottish Museum (Dr D A Allan), 215
- Royal Society of Edinburgh Election of Officers, 505
- Royal Society of London *Philosophical Transactions* of the (Dr W P D Wightman), 23 (Dr O M Lidwell), 584
  - Mathematical Tables, Vol 5, Representations of Primes by Quadratic Forms (prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta), (edited by J C P Miller), *review* by Prof C A Coulson, 97
  - Mathematical Tables, Vol 6, Tables of the Riemann Zeta Function (C B Haselgrove, in collaboration with J C P Miller), *review* by Prof C A Coulson, 97
  - Mathematical Tables, Vol 7, Bessel Functions (edited by F W J Olver), Part 3, Zeros and Associated Values, *review* by Prof C A Coulson 97
  - Invitation for a delegation from the Academia Sinica in Peking to visit Britain, 211
  - Copley Medal awarded to Sir Hans Krebs, 606, 905
  - Davy Medal awarded to Prof D H R Barton, 606, 906
  - Sylvester Medal awarded to Prof P Hall, 606, 906
  - Hughes Medal awarded to Prof A H Cottrell, 606, 907
  - Royal Medal awarded to Prof C F Powell, 707, 905
  - Royal Medal awarded to Sir Wilfrid Le Gros Clark, 707, 906
  - Leverhulme Tercentenary Medal awarded to Sir Cyril Hinshelwood, 907
  - Activities of the (Sir Howard Florey), 905
  - Anniversary Address, Exchange of Substances between the Blood and Tissues (Sir Howard Florey), 908
  - Election of Officers for 1962, 918
  - The Halley Bay Expedition of the, *review* by Dr R Stoneley, 1004
  - Expedition to Tristan da Cunha, 1129
  - Discussion on Mechanisms of Virus Infections, 1246
- Royal Society International Geophysical Year Antarctic Expedition, Halley Bay, Coats Land, Falkland Islands Dependencies, 1955-1959 (General Editor, Sir David Brunt), Vol 1, Introductions, Aurora and Airglow, Geomagnetism, *review* by Dr R Stoneley, 1004
- Royal Society of Medicine Christmas Lectures, 1026
- Roycroft, J D Awarded a Fellowship in solid-state physics in the University of Glasgow, 1132
- *RP2-L*—a Nuclear Protein of Neoplastic Tissues Binding of, to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870
- Rubber Research Institute of Malaya (sponsored by the, with the support of the Government of the Federation of Malaya and the Rubber Producers' Council of the Federation of Malaya) Natural Rubber Research Conference—Proceedings of the (Kuala Lumpur 1960), *review* by Dr W F Watson, 491
- Rubber (Natural) Producers' Research Association Symposium on Fundamental and Practical Approaches to Ageing Protection, 115
- Rubber (Natural) Research Conference Proceedings of the (Kuala Lumpur 1960), (sponsored by the Rubber Research Institute of Malaya, with the support of the Government of the Federation of Malaya and the Rubber Producers' Council of the Federation of Malaya), *review* by Dr W F Watson, 491
- Rubeanic Acid as Stabilizer of Aqueous Solutions of Ascorbic Acid (Aleksandra Smoczkiewiczowa and Janina Grochmalicka), 161
- Rubin, Dr Alan A, and others A Non-diuretic Benzothiadiazine with Antihypertensive Properties, 176, *erratum*, 802
- Rubin, Dr Emanuel, and others Nature of Increased Protein and DNA in Chronic Hepatic Injury, 886
- Rubin, R P (Douglas, Prof W W, and) Mechanism of Nicotinic Action at the Adrenal Medulla—Calcium as a Link in Stimulus-secretion Coupling, 1087
- Rubin de Celia, Enrique, and others Epidemiological Surveys on Chagas' Disease in the Village of Matalaque, Southern Peru, 921
- Ruby Masers (Optical) Mode Characteristics and Coherence in (Dr I D Abella and Dr C H Townes), 957
- Ruhenstroth-Bauer, Prof G (Sachtleben, P, and) Agglutination and the Electrical Surface Potential of Red Blood Cells, 982
- Rumberg, B, and others Oxidized Cytochrome and Chlorophyll $C_2{}^+$ in Photosynthesis, 967
- Ruminant Dietary Citrate and Hypomagnesaemia in the (A W A Burt and D C Thomas), 1193
- Runeckles, Dr V C Plant Phenolics Group of North America, 418
- Runner Bean Seeds 'Bound' Gibberellin in Mature (A J McComb), 575
- Rush, C A, and Miller, J I Microchemical Techniques (Barium Isopropyl Methylphosphonate as a rigorous Reference Standard for Carbon, Hydrogen, Phosphorus, Barium and Alkoxyl), 411
- Rushton, Dr K R Appointed lecturer in civil engineering at the University of Birmingham, 406
- Rushton, Dr Ruth, and others Modification of the Effects of an Amphetamine–Barbiturate Mixture by the Past Experience of Rats, 533
- Ruskell, Gordon L, and others Anatomy and Histology of the Eye and Orbit in Domestic Animals, *review* by Dr E N Willmer, 295
- Russell, Sir John The Soil as an Environment for Animal Life (Soil contains four groups of Components), 315
  - Honour of Commander of the Order of Agricultural Merit conferred on, by the French Minister of Agriculture on the occasion of the bicentenary of the French Academy of Agriculture, 1132
- Russell, Sir John, and Wright, Dr Norman C (edited by) Hunger—Can it be Averted ?, 417
- Russell, R Scott (edited by J F Loutit and) The Entry of Fission Products into Food Chains, *review* by Dr Hugh D Evans, 6
- Russell, T A Trees of Consequence, *review*, 488
  - Wealth of the Forest, *review*, 693
- Russia (Asiatic) Some Aspects of, *review* by Prof S I Tomkeieff, 200
  - Physical Geography of (S P Suslov), translated from the Russian by Noah D Gershevsky, edited by Joseph E Williams, *review* by Prof S I Tomkeieff, 200
- Russian Large Nuclear Explosions Microbarograph Records from the (E W Carpenter, G Harwood and T Whiteside), 857
- Russian Nuclear-Weapons Tests of September 1961 Radioactivity in Rainfall during September 1961 following the (Keith Boddy), 443
- Russian Parasitology Ecological Branch of, *review* by Dr Ben Dawes, 832
- Russian Space Research, 19
- Rutgers State University Center of Alcohol Studies transferred from Yale University to, 404
- Rutherford (Lord) Award of the British Institution of Radio Engineers awarded to E C Fellows, 609
- Rutherford Jubilee International Conference on Nuclear Physics (Dr A Herzenberg), 794
- Ryan, B Thalassaemia in Melanesia, 75
- Ryan, Dr B P K, and Parsons, I C Glucose-6-Phosphate Dehydrogenase Activity in Papuans, 477
- Ryan, J, and others A Micromethod for the Determination of Bradykininogen in Blood Plasma, 1194
- Rybicka, Krystyna Cell Reduction in the Embryonic Development of the Cestode *Diorchis ransomi* Schultze (1940), 771
- Rychter, Z (Lemez, L, and) Number of Re-Circulations of Chick Embryo Erythrocytes, 1298
- Rytomaa, Tapio, and Teir, Prof Harald Relationship between Tissue Eosinophils and Peroxidase Activity, 27

- SAACKE, R G, and Almquist, Prof J O Freeze-drying of Bovine Spermatozoa, 995
- Saari, Prof E At the Thirteenth Congress of the International Union of Forest Research Organizations (Translations of the Classification, and Terminology), 615
- Sabine, T M, and others X-Ray and Neutron Diffraction Examination of *p*-Diphenylbenzene, 154
- Sabine (Wallace Clement) Award of the Acoustical Society of America given to Dr Leo L Beranek 507 710

Sachtleben, P , and Ruhenstroth-Bauer, Prof G Agglutination and the Electrical Surface Potential of Red Blood Cells, 982
Sackler, A M (Weltman, Dr A S , and) Effects of Thymectomy on the Resistance of Rats to Drowning and Histamine Stress, 460
Sadhu, D P (Chaudhuri, Sukhen, and) Thyroid Activity at Higher Ambient Temperatures, 560
Sadler, Dr P W (Bauer, Dr D J , and) Research on the Chemotherapy of Virus Diseases (Antiviral Action of Derivatives of Isatin β-thiosemicarbazone on Viruses of the Pox Group), 807
Sadler, Dr P W (O'Sullivan, Dr D G , and) Agents with High Activity against Type 2 Poliovirus, 341
Sadri, Katy K , and others Complement-fixing Antibodies to Human Growth Hormone and Sheep Interstitial Cell Stimulating Hormone, 260
Sadron, Ch Structure, Synthesis and Function of Deoxyribonucleic Acid (Macromolecular Structure of DNA), 24
Saenz, J P (Valverde, R , and) Production of 'Active' Magnesium Oxide by Heating in Vacuum 653
Safety in Mines Research Establishment Annual Report for 1960 (Ministry of Power), 709
Sahara The Arthropod Parasites of Vertebrates in Africa South of the (Ethiopian Region), Vol I, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
Saito, Dr S , and others Soluble Collagen in Bone, 758
Saito, Tsuneyuki (Arai, Ken-ichi, and) Changes in Adenine Nucleotides in the Muscles of some Marine Invertebrates, 451
Saito, Tsuneyuki (Tsujino, Isami, and) A New Unsaturated Uronide isolated from Alginase Hydrolysate, 970
Salaries Personnel Management—Report of a Survey undertaken in February–March 1961 (Institute of Personnel Management), 506
Saliva Application of Atomic Absorption Spectroscopy to the Determination of Calcium in (Ernest Newbrun), 1182
Saliva of a Plant-Bug Oxidase Activity in the (P W Miles and Ann Helliwell), 374
Saliva (Mixed), from Sheep (W R McManus), 1161
Saliva (Sheep) Secretion of Nitrogen in (M Somers), 318
Salivation (Parotid), in Sheep Effect of Urea Ingestion (A D Wilson), 271
Salmon (Canadian), caught off Greenland (C J Kerswill and M H A Keenleyside), 279
Salmonella typhimurium after Irradiation with Ultra-Violet Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in (T Hudnik-Plevnik and Dr L A Stocken), 554
Salt Electrolytic Manufacture of Chemicals from (Dr D W F Hardie), *review* by Dr M J Newlands, 902
Salt Concentrations (High and Physiological) Antigen–Antibody Precipitation contrasted in Gels of (Dr Alfred J Crowle and David C Lueker), 50
Salt Deserts of the World Salt Marshes and (Prof V J Chapman), *review* by Prof W T Williams, 833
Salt Marshes and Salt Deserts of the World (Prof V J Chapman), *review* by Prof W T Williams, 833
Salt Movement through Tomato Roots Effect of Water Movement on (William Lopushinsky and Paul J Kramer), 994
Salts Influence of adding, to the Medium on Counts of Phenol-treated *Escherichia coli* on Membrane Filters (N D Harris and J P Richards), 87
Salts of Methylated Purines and Pyrimidines Crystal Structures of (R F Bryan and K Tomita), 812
Salts (Organic) Influence of some, on the Absorption of Potassium by Vermiculite (Prof M M Mortland), 481
Samples of Groundnuts Toxicity associated with certain (Dr M C Lancaster, F P Jenkins and J McL Philp), 1095 , (Dr K Sargeant, Ann Sheridan, J O'Kelly and R A Carnaghan), 1096
Samples (Biological) Estimation of Mass Thickness of, from their Electron Micrographs (M L De), 546
Samples (Nucleic Acid) Ferromagnetic Inclusions in (W M Walsh, jun , R G Shulman and R D Heidenreich), 1041
Sampling and Analysis of Combustion Products, *review* by Dr C F Cullis, 1108
Sampling (Gas), and Chemical Analysis in Combustion Processes (Prof G Tine), *review* by Dr C F Cullis, 1108
Samuel, Prof Pierre (Zariski, Prof Oscar, and) Commutative Algebra, Vol 2, *review* by Prof L S Goddard, 855
Sandage, Dr Allan The Hubble Atlas of Galaxies, *review* by Prof R O Redman, 838
Sandermann, Prof W Wood Extractives (Biogenesis of Terpenes in Plants), 511
Sanders, Dr A G Mechanisms of Virus Infections, 1248
Sanders, Dr H G At the First British Insecticide and Fungicide Conference (Increasingly Important part played by Chemicals in Farming), 1140
Sanders, Dr J H Maser Theory, *review*, 202
  Awarded a grant of £1,500 from the Paul Instrument Fund (in supplement of a previous grant), for the construction of an optical maser, 708
Sanders, J L , and others Pituitary Effect on Synthesis of Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation, 1309
Sanders, Dr L G Thermionic Generation of Electricity (Processes of Ionization and De-ionization in a Diode), 612
Sanderson, A E At the Annual Meeting of the Library Association (Functions of Training College Libraries), 931
Sanderson, R P (McKenna, Dr J M , and) Effect of Phagocytosis on the Lysis of *Staphylococcus aureus* (Type 81) by Bacteriophage, 570
Sandia Corporation *SCR*-299, Bibliography of Tables and Charts for Use in Gas Dynamic Studies (D E Randall), 308
  SCR-288, Mach Tables for Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with Total Temperatures to 10,000° K (K L Goin), 308
  Technical Papers of the, 1025
Sands, Donald E , and others X-Ray Data for the Chrome-Urania System, Cr_2O_3 $2UO_3$, 861
Sandstone (Old Red), of Brown Clee Hill and the Adjacent Area, I, Stratigraphy (Harold William Ball and David Lawrence Dineley) , 2, Palaeontology (Errol Ivor White), (Bulletin of the British Museum (Natural History), Geology, Vol 5, No 7), 1250
Sang, Dr J H Polymorphism in Insects (Environmental Control of Mutant Expression), 414
Sano, Dr Yumiko, and others A New Mutant of Dermovaccinia Virus, 381
Sansone, Prof G , and Gerretsen, Dr Johan Lectures on the Theory of Functions of a Complex Variable, Vol I, Holomorphic Functions, *review* by Prof W K Hayman, 694
Santapau, Prof H Appointed superintendent of the Botanical Survey of India, 606 , work of, 606
Santholzer, Prof W , and others Systematic Measurement of Fall-out in Czechoslovakia up to 1961, 398
Sarajas, H S S , and others Thrombocytosis evoked by Exercise, 721
Sarcione, Edward J , and others Blood Glucose-6-Phosphate in Heterozygous Carriers and Patients with Liver Glycogen Disease (Von Gierke's Disease), 265
Sarcoma Cells (Rous) Ultrastructural Alterations during the Crabtree Effect in (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
Sarcosomes (Rabbit-Heart) Relationship between Oxidation of Isocitrate and Metabolism of Fatty Acids in (Dr W C Hulsmann), 1153
Sargeant, Dr K , and others Toxicity associated with certain Samples of Groundnuts, 1096
Sario, Prof Leo (Ahlfors, Prof Lars V , and) Riemann Surfaces, *review* by Prof W K Hayman, 847
Sarjant, R J Technical Data on Fuel, *review*, 1008
Sarjeant, Dr W A S and others Classification of Fossil Microplankton, 471
Sarkar, Dr Nirmal K , and others Effects of Irradiation on the Incorporation of Amino-Acid into Normal and Regenerating Rat Liver, 179
Sarnoff (David) Award in Electronics of the American Institute of Electrical Engineers presented to Dr C H Townes, 606
Satellite Microwave Dipoles Long-Range Radio Communication by, 109
Satellites Artificial Earth (British Astronomical Association), 802
Satellites (Artificial), of Earth Errors in Orbital Predictions for (Kenneth Moe), 151
Satellites (Selenoid) Exact Determination of the Lunar Mass by means of (Dr E T Benedikt), 442
Saukkonen, Dr J J Acid-soluble Nucleotides of *Staphylococcus aureus*—Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of Penicillin, 816
Saunders, Dr L Phospholipids and Sulpholipids (Behaviour of fairly Concentrated Sols of Lecithins in Water with Salt Solutions), 808
Saunders, Prof O A Appointed a member of the Council for Scientific and Industrial Research, 113
Savage, Dr R J G *Obituary* of M A C Hinton, 916
Savige, Dr W E , and others At the Third Australian Spectroscopy Conference (Electron Paramagnetic Resonance Properties of Cystine and related Compounds after Irradiation with Mercury 2537 Å Radiation and a Sun-lamp (Peak ~ 3100 Å)), 929
Savory, Theodore H Spiders, Men and Scorpions, *review* by Dr E Duffey, 829
Sawicki, E Microchemical Techniques (Present Status of Micro Methods for the sensitive and selective Detection and Determination of Aldehydes and Aldehyde-yielding Substances), 411
Sawicki, E , and co-workers Microchemical Techniques (Highly Sensitive Spectrophotometric Determination of Azuelene), 411
Sawicki, Dr Leon Influence of Age of Mice on the Recovery from Experimental Sendai Virus Infection, 1258
Sawhney, K , and others Cotton in India, Vol 2, and Vol 4, *review* by Prof S C Harland, 200
Sawkill, J Metallurgy of Beryllium, 1138
Sawyer, P O Microchemical Techniques (Value of Photometric Titrations for Metal Ions present in Small Amounts or at extremely Low Concentrations), 411
Saxena, M N , and others Occurrence of Graywacke in the Lower Siwaliks, Simla Hills, 61
Scaife, Dr D E (Graham, Dr J , and) Logand Field for Chromic Ions in the Corundum Lattice, 161
Scale Height (Atmospheric), as a Modifying Influence on Linear Trend of *F*-Region Electron Density with Sunsport Number (Jean M Bullen), 542
Scanning Techniques in Biological and Medical Microscopy (New York Academy of Sciences Conference on), 1030
Scattering (Rayleigh) Lattice-like Vibrations in Associated Liquids and the Origin of Anomalous (J K Wilmshurst), 1061
  Tables related to Radiation emerging from a Planetary Atmosphere with (Kinsell L Coulson, Jitandra V Dave and Zdenek Sekera), *review* by Prof Zdenek Kopal, 1005
Schachter, Dr M Appointed reader (at University College, London), in physiology, 802
Schafer, I A , and others New Renal Tubular Amino-Acid Transport System and a New Hereditary Disorder of Amino-Acid Metabolism, 672
Schaller, A and others Concentration of Inhaled Cerium-144 in Pulmonary Lymph Nodes of Human Beings, 1308
Scharfe, Dr J The Better Use of the World's Fauna for Food (Improvements and Trends of Development in Marine Fishing Methods and Gear), 1114
Schizophrenia Orosomucoid in (Dr M Goodman, Prof E D Luby, Dr C E Frohman and Dr J S Gottlieb), 370
Schlichting, Dr Hermann Boundary Layer Theory, fourth edition, translated by Dr J Kestin, *review* by E J Watson 842
Schlichting, Dr Hermann, und andere (herausgegeben von) Ludwig Prandtl Gesammelte Abhandlungen zur Angewandten Mechanik, Hydro- und Aerodynamik (schriftlietung F W Riegels), Teile 1-3, *review* by M James Lighthill, 841
Schmid, K (Binette, J P , and) Resolution of Pathological Human Gamma-Globulins by Starch-Gel Electrophoresis, 732
Schmid, O J , and Mann, H Action of a Detergent (Dodecylbenzenesulphonate) on the Gills of the Trout, 675
Schmid, Prof Rudi, and others Enterohepatic Circulation of Bilirubin, 372
Schmidt-Kuster, W-J (Wiesner, L , and) Microchemical Techniques (Gas Chromatographic Performance of a New Integrating Counter-detector using a Flow-type Proportional Counter containing a source of Ionizing Radiation and used with a suitable Scaler), 412
Schneer, Cecil J The Search for Order—the Development of the Major Ideas in the Physical Sciences from the Earliest Times to the Present, *review* by Prof Herbert Dingle, 901
Schneider Dr K At the twenty-seventh Conference of the International Federation for Documentation (Use of Electric Typewriters operated by Punched Cards), 219

Schoental, Dr R Interaction of the Carcinogenic *N*-Methyl-Nitrosourethane with Sulphydryl Groups, 670
Schofield, H J , and others Volatile Mustard Oils of *Brassica juncea* Seeds, 993
Scholars (Science Research), of the Royal Commission for the Exhibition of 1851 (1891-1960) Record of the, 1240
Scholarship Commission (Commonwealth) First Annual Report (1959-60), 1130
Scholarship (Denny) in Marine Engineering (1961) awarded by the Royal Institution of Naval Architects to David K Brown, 309
Scholarship (Parsons) in Marine Engineering (1961) awarded by the Royal Institution of Naval Architects to Alan B Turner, 309
Scholarships Perkin Centenary (Perkin Centenary Trust), 506
Scholarships (Research), in Electrical Engineering or Physics (British Broadcasting Corporation), 115

Sen Gupta Archana, and Sen, S P Formation of Auxin-bound Proteins, 1290
  Effect of Indole-3-Acetic Acid (IAA) on Phosphorus Metabolism in the *Avena* Coleoptile, 1291
Sen-Sarma, P K (Roonwal, M L, and) Contributions to the Systematics of Oriental Termites, *review* by W V Harris, 851
Sendai Virus Infection (Experimental) Influence of Age of Mice on the Recovery from (Dr Leon Sawicki), 1258
Senescence A Distinction between Bolting and Flowering Effects on (Prof Jules Janick and A C Leopold), 887
  Rate of (Dr A E Needham), 579
Senior Research Fellowships in Clinical Research (Wellcome Trust), 1026
Sensation and Perception (D W Hamlyn), *review* by F I G Rawlins, 593
Sensitivity (Anaphylactic) A New Test for detecting—the Basophil Reaction (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
Sensory Deprivation and Foetal Circulatory Homeostasis (Prof S R M Reynolds), 818
Separation of Bacteria by Counter-Current Distribution (G David Baird, Per-Åke Albertsson and Bengt v Hofsten), 236
Separation of Low Molecular Weight Peptides from Amino-Acids of 'DEAE-Sephadex' (P R Carnegie), 658
Separation (Chromatographical), of Carbohydrate *O*-Isopropylidene Derivatives (J E G Barnett and Dr P W Kent) 556
Separation (Differential Leucocyte) Culture of Human White Cells using (James Hastings, Stanley Freedman, Orlando Rendon, Herbert L Cooper and Kurt Hirschhorn), 1214
Separation (Electrophoretic), of Conjugated Bilirubin on Paper (Dr E Talafant), 972
Separation, Identification and Determination of the Fatty Acids of Montan Wax (D R Hewett, P J Kipping and P G Jeffery) 65
'Sephadex' Purification of Fluorescent Protein Conjugates—Comparison of Charcoal and (Dr J E Fothergill and Dr R C Nairn), 1073
Sephadex' ('DEAE-) Separation of Low Molecular Weight Peptides from Amino-Acids on (P R Carnegie), 658
Sequence (Amino-Acid) The Complete (Amino-Acid Sequence of Horse, Heart Cytochrome c) (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125

Sequence (Amino-Acid), of Horse Heart Cytochrome *c*—Peptides released by Digestion with Chymotrypsin (Dr E Margoliash and Prof Emil L Smith), 1121 , Peptides, Terminal and Internal, released by Digestion with Trypsin (Dr G Kreil and Prof H Tuppy), 1123 , The Complete Amino-Acid Sequence (Dr E Margoliash, Prof Emil L Smith, Dr Gunther Kreil and Prof Hans Tuppy), 1125
Sequence Studies (Nucleotide) Specific Partial Hydrolysis of Nucleic Acids in (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Sequences (Chromatography and Nucleotide), of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet (T Hudnik-Plevnik and Dr L A Stocken), 554
Sera of various Animals Distribution of Trypsin Inhibitors in the (S Nakamura and T Wakeyama), 1077
Sera of Native Africans Distribution of Group-specific Components (*Gc*) in the (Dr Jan Hirschfeld and Jean Sonnet), 766
Sera (Chimpanzee) Transferrin Differences in (Prof John Buettner-Janusch), 632
Sergean, R (de la Mare, Gwynneth, and) Validity of Prediction based on Cross-Sectional Analysis, 1318
Serial Propagation of Types 1, 2, 3 and 4 Dengue Virus in HeLa Cells with Concomitant Cytopathic Effect (Sonja M Buckley), 778
Serine and Urea (Glycine,) Some Tetrahydropyranyl Derivatives of (S M Amir, Dr M Z Atassi, Dr S A Barker, Dr J S Brimacombe and Dr M C Keith), 1069
Serological Evidence of a Chromatographic Sub-fractionation of Human 7S γ-Globulin (Ulf Nilsson), 1301
Serological Relationships between the Nine-spined and the Three-spined Stickleback(Tadeusz Penczak), 673
Serotonin in the Small Intestine of Conventional and Germ-free Chicks (Prof A W Phillips, H R Newcomb, J E Smith and R Lachapelle), 380
Serratia marcescens Free-Radical Formation during Storage of Freeze-dried (Dr R L Dimmick, R J Heckly and D P Hollis), 776
Serum Growth Hormone Content of, in Infants, Children, Adults and Hypopituitary Dwarfs (Dr J Girard, Dr M Vest and Dr N Roth), 1051
  Presence of Two Iron-Transport Proteins in (Dr M Faber and R Jordal), 181
Serum (Mouse), and Ascitic Fluid Identification of Antibody in β_2-Globulins of (Dr R T Jordan, J Banovitz, I L Trapani and Dan H Campbell), 885
Serum-free Cell Cultures Cytopathic Protective Factor, its Production by Normal Uninfected (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Serum Albumin Solutions (Bovine) Nuclear Magnetic Resonance Spectroscopy of Proteins—the Hydrogen Bonding of Water in (F A Bovey), 324
Serum γ-Globulin in the Guinea Pig Effect of Diethylstilboestrol on the (L M Charles and Prof T Nicol), 565
Serum β-Globulin Types in Red Deer and other Species and their Stability in the Presence of Bacteria (V P W Lowe and E I McDougall), 983
Serum Groups (Blood and), in Reindeer compared with those in Cattle (Bo Gahne and Jan Rendel), 529
Serum Protein Fractions of the Developing Chicken Embryo Comparison of the, by the Technique of Starch-Gel Electrophoresis (A Amin), 356
Serum Proteins Starch Gel Electrophoresis of Hen Egg White, Oviduct White, Yolk, Ova and (Dr F Steven), 972
Service Medal of the Textile Institute awarded to P H S Bell and to J Boyd, 406
Service of Medicine Chemistry in the (Second British Congress on the History of Medicine and Pharmacy), 1017
Service (Public) Scientists in the—Special Promotions, 214
Services (Abstracting) Inventory of (Féderation Internationale de Documentation), 1026
Services (Health), in Small Factories (World Health Organization Regional Office for Europe (United Nations), and the International Labour Organization Conference on), 618
Sesquisulphide (Molybdenum) Structure of (Prof F Jellinek), 1065
Sethi, B L , and others Cotton in India, Vol 2 and Vol 3, *review* by Prof S C Harland, 200
Severi, Prof Lucio Cancer Research in the University of Perugia Medical School, 217
Sewage Works (Water and) Problems of Radioactivity at (Course of lectures on, in the Department of Municipal Engineering of Manchester College of Science and Technology), 609
Sex Determination in Hemp Influence of the Age of Pollen and Stigmas on (Regina Laskowska), 147
Sex Hormones as a Possible Factor controlling Biosynthesis of Arylesterase (Dr Klas-Bertil Augustinsson and Bertil Olsson), 969
Sex Ratio (Primary Embryonal), in Normal Pregnancies determined by the Nuclear Chromatin (Prof F E Szontagh, A Jakobovits and Ch Mehes), 476
Sexual Phase in the Life-Cycle of an Amoeba Evidence for a (M R Droop), 281, *erratum*, 507
Seychelles Archipelago Potassium–Argon Age Determinations on Granite from the Island of Mahe in the (J A Miller and J D Mudie), 1174
Shand, J A , and others Stanford–Pacific Naval Laboratory Conjugate Point Experiment, 319
Shape of Membrane Action Potential of the Heart Effects of Intensity of Driving Stimulus on the (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Sharma, A , and others Morphological Changes following Transplantation and Chronic Obstruction of the Rabbit Appendix, 877
Sharma, Prof B D , and Donohue, J Crystal Structure of 2-Phenylazulene, 863
Sharma, J D , and others Pharmacodynamical Effects of Asarone and β-Asarone, 1299
Shaw, Dr J C Agricultural Problems in Developing Countries (Animal Production Problems), 1029
Shaw, Dr William H R Cation Toxicity and the Stability of Transition-Metal Complexes, 754
Shcherbakov, D I Geochronology Research in the Soviet Union, 114
Shearman, E D R Appointed senior lecturer in electromagnetism in the Department of Electrical Engineering, University of Birmingham, 507, 1241
Shearn, Dr R B Appointed lecturer in chemical engineering at the University of Birmingham, 406
Shedding (Vortex), from the End of a Tube as a Result of Buoyancy Effects (A A Putnam), 1277
Sheep Diet of (G W Arnold), 113
  Effect of Urea Ingestion on Parotid Salivation in (A D Wilson), 271
  Effect of Whole-Body Irradiation and Cortisone on the Development of *Ostertagia* spp in (J D Dunsmore), 139
  Hormones and Electrolyte Excretion in (R Kinne, Dr W V Macfarlane and Prof O E Budtz-Olsen), 1084
  Mixed Saliva from (W R McManus), 1161
Sheep (Grazing) A New Method of Estimating the Dry-Matter Intake of, from their Faecal Output (J V Owen), 92
Sheep (Merino and Southdown) Relationships between Red Blood Cell Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in (Prof J V Evans), 567
Sheep Interstitial Cell Stimulating Hormone Complement-fixing Antibodies to Human Growth Hormone and (Allen Trenkle, N R Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Sheep Liver (Normal) Metabolism of Propionate by Homogenates of (R M Smith and W S Osborne-White), 868
Sheep Pituitary Extract Effect of, on Hypercholesterolaemia in Intact and Hypophysectomized Rats (Dr Russel M Barakat), 71
Sheep Red Blood Cells Utilization of, in the Haemadsorption Test for Myxoviruses(H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Sheep Saliva Secretion of Nitrogen in (M Somers), 318
Sheldon, R W , and others Life and its Environment in Ancient Seas (Aspects of the Palaeoecology of Marine Faunas in the Upper Carboniferous of the Southern Pennines), 925
Shell Regeneration in *Ariophanta* sp Effect of Ribonuclease on (K K Nair and P T Muthe), 674
Shelley, Prof Walter B , and Juhlin, Lennart A New Test for Detecting Anaphylactic Sensitivity—the Basophil Reaction (1056, September 9), *erratum*, 21
Shepherd, J Appointed lecturer in electrical engineering at the University of Edinburgh, 507
Shepley, Kathryn (Morton, Prof R K , and) Crystallization of Cytochrome b_2 Free of the Deoxyribonucleic Acid Component, 639
Sheppard, Dr P M Polymorphism in Insects (Recent Work on Polymorphic Mimetic Swallowtail Butterflies), 413
  Molecular Biology and Population Structure, 414
Sheppard, R C , and others Structures and Conformations of some Naturally Occurring Derivatives of Proline, 1150
Sheridan, Ann, and others Toxicity associated with certain Samples of Groundnuts, 1096
Sheridan, Dr J (Job, B E , and) Microwave Spectrum of Fluoro-Acetonitrile, 160

Sound Waves (Round-the-World), produced by the Nuclear Explosion on October 30, 1961, and their Effect on the Ionosphere at Sodankylä (G Rose, J Oksman and E Kataja), 1173
Soundranayagan, Dr S Appointed lecturer in engineering at the University of Edinburgh, 507
Source of β-Glucuronidase Female Rat Preputial Glands as a (Dr Margaret I Stern), 359
Sources of Alternating Current and Direct Current Formation of Active Nitrogen using (G G Mannella), 159
Sources (New), of Energy (United Nations Conference on), 407
South Richard The Moths of the British Isles, new edition, First Series, Sphingidae, Endromidae, Saturniidae, Notodontidae, Thyatiridae, Drepanidae, Lymantriidae and Noctuidae , Second Series, Lasiocampidae, Arctiidae, Geometridae, Cossidae, Limacodidae, Zygaenidae, Sesiidae and Hepialidae, *review* by A Watson, 830
South African Institute for Medical Research Publications, No 1, Vol 9, The Arthropod Parasites of Vertebrates in Africa South of the Sahara (Ethiopian Region), Vol I, Chelicerata (edited by F Zumpt), *review* by Dr F A Turk, 1222
South Australia Occurrence of Magnesite–Dolomite Sediments in (Prof A R Alderman and C C von der Borch), 861
South Australian Museum Report for 1959-60, 20
  Records of the, Vol 14, No 1, 921
Southdown Sheep (Merino and) Relationships between Red Blood Cell Potassium Concentrations, Medial Corpuscular Fragility and Haemoglobin Type in (Prof J V Evans), 567
Soviet Hydrometeorological Service (R F Zobel), 1141
Soybean Seedlings Effect of Temperature during Germination on the Crystalline Type of Starch in (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
Space (Five) Equation of Motion in (Prof Christopher Gregory), 1320
Space (Outer) Fourth Colloquium on the Law of, 1244
Space Group and Unit Cell of the *m*-Bromobenzoate of Photoisopyrocalciferol (Prof G L Hardgrove), 551
Space Research Russian, 19
Spaceflight Report to the Nation (American Rocket Society), 1244
Spartinetum at Baldoyle in Ireland (Patricia J Boyle and James A Kavanagh), 81
Spawning Mechanism in the Male Lugworm (Dr D I D Howie), 1100
Special Confluent Hypergeometric Functions for Asymptotic Solutions of Differential Equations of the Second Order Tables of Airy Functions and (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Specialists' Conference on Culture Collections, 309
Species of the Teleostean Genus *Lebetus* (P J Miller), 675
Species (Biological), confused under the Name *Culicoides austeni* (Carter, Ingram and McFie), (D H Murphy), 186
Specific Antigens of Human Leucocytes and Thrombocytes (Nechama Gilboa-Garber and Dr A Nelken), 466
Specific Partial Hydrolysis of Nucleic Acids in Nucleotide Sequence Studies (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Specificity of Plant Feeding in Mosquitoes as determined by Radioactive Phosphorus (Dr A A Abdel-Malek and Dr W F Baldwin), 178
Specificity (Substrate), and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Spectra (Infra-red), of Lead and other Carbonates A Difference Band of a Fundamental and a Lattice Mode in the (C J H Schutte and K Buijs), 351
Spectral Characteristics of Type II Solar Radio Bursts (Prof P A Sturrock), 58
Spectrophotometry (Photoelectric) Modified Cuvettes for (Dr Malcolm H Smith), 722
Spectroscopic Studies using Time-Resolved Techniques (Institute of Physics and the Physical Society Conference on), 1032
Spectroscopic Survey of English and Continental Medieval Glazed Pottery (L C Thomas and J W G Musty), 1143
Spectroscopy Molecular Structure and (Ohio State University Symposium on), 1241
  Time-Resolved (Prof J D Craggs), 1032
Spectroscopy Conference Third Australian (Dr R A Durie), 927
Spectroscopy Conference (Western) Ninth Annual (Western Spectroscopy Association), 507
Spectroscopy (Atomic Absorption) Application of, to the Determination of Calcium in Saliva (Ernest Newbrun), 1182

Spectroscopy (Nuclear Magnetic Resonance), of Proteins—the Hydrogen Bonding of Water in Bovine Serum Albumin Solutions (F A Bovey), 324
Spectrum (Biological), of some New Tuberculostatic 1,3,4-Oxadiazolones with special reference to Cross-Resistance and Rates of Emergence of Resistance (Prof A E Wilder Smith and Hans Brodhage), 1195
Spectrum (Microwave), of Fluoro-Acetonitrile (B E Job and Dr J Sheridan), 160
Spectrum Line 4603 Å of Lithium Stark Broadening of the (K C Lapworth), 252
Speech (British Association for the Advancement of Science, Section I (Physiology and Biochemistry) and Section J (Psychology), Joint Symposium on), 601
  Arrest of Acceleration of, evoked by Thalamic Stimulation in the Course of Stereotaxic Procedures for Parkinsonism (Dr G Guiot, and collaborators), 921
Speech-Rate Experimental Alteration of the, 921
Speed (High-) Direct-Recording System for Electron Diffraction (Dr C W B Grigson) 647
Speer, Prof J At the Thirteenth Congress of the International Union of Forest Research Organizations (Forest Economics), 614
  Elected president of the International Union of Forest Research Organizations, 615
Spence, Dr John A Probable Mechanism of Resistance of Varieties of Cocoa to Black Rod Disease caused by *Phytophthora palmivora* (Butl) Butl , 278
Sperm (Herring-) Deoxyribonucleic Acid Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of (Prof A Stolk), 1215
Spermatocytogenesis with Possible Spermiogenesis of Guinea Pig Testicular Cells grown *in vitro* (Dr Russell T Jordan, Dr Seymour Katsh and Nadia de Stackelburg), 1053
Spermatogenesis of *Drosophila melanogaster* Radiosensitive Stages in the (V A Strangio), 781
Spermatozoa (Bovine) Freeze-drying of (R G Saacke and Prof J O Almquist), 995
Spermiogenesis of Guinea Pig Testicular Cells grown *in vitro* Spermatocytogenesis with possible (Dr Russell T Jordan, Dr Seymour Katsh and Nadia de Stackelburg), 1053
Sperti, G S (Mulay, I L , and) Effect of Ultra-Violet Radiation and Desiccation on Different Age-Cultures of *Escherichia coli* K12, 773
Spheroplasts of Marine Bacteria induced by the Action of Penicillin (J R Boring and Prof D Pratt), 773
Spherulites (Paracrystalline), of Biological Origin Some Physico-Chemical Properties of (Dr G T Stewart), 624
Spider (Fruit Tree Red) Evaluation of the Activity of some Diphenyl Compounds on Winter Eggs of the (J Meltzer), 474
Spider Mites Relation between Organophosphorus-Resistance and Non-Diapause in (W Helle), 1314
Spiders, Men and Scorpions (Theodore H Savory), *review* by Dr E Duffey, 829
Spiers, Prof F W A Warning System for Nuclear Accidents, 31
Spiers, H M (edited by) Technical Data on Fuel, sixth edition, *review* by R J Sarjant, 1008
Spilsbury, Dr R J Evolution of Regeneration, and its Possible Bearing on Philosophy, 1254
Spin (Electron-) Resonance Signals from Lyophilized Bacterial Cells exposed to Oxygen (Dr M B Lion, Dr J S Kirby-Smith and Dr M L Randolph), 34
Spin (Nuclear), of Protoactinium-231 from Hyperfine Splitting (E W T Richards, A Ridgeley, N J Atherton and H S Wise), 444
Spin Magnetization Variation in a Two-level Maser Oscillator Detection of (I M Firth and Dr D Bijl), 860
Spin Resonance Electron (Chemical Society Symposium on), 1034
Spines from a Marine Diatom Penetration of, into the Gill Tissue of Lingcod (*Ophiodon elongatus*), (Dr Gordon R Bell), 279
Spines of the Sea Urchin, *Stomopneustes variolaris* (Lamarck) Isolation of Echinochrome A from the (Dr K Nishibori), 1293
Spinner, Dr E At the Third Australian Spectroscopy Conference (Vibrational Spectra and Structures of the Hydrochlorides of the Aminopyridines), 927
Spit, B J (edited by A L Houwink and) Proceedings of the European Regional Conference on Electron Microscopy (Delft, 1960), *review* by Prof R D Preston, 1220
Splachnum ampullaceum (L) Hedw Vacuolation and Leaf Regeneration in (Prof Kraft E von Maltzahn)—Formation of Secondary Vacuoles in De-differentiating Cells, 55 , Effect of Kinetin on Attached Leaf Regeneration, 56
Spleen of the Cat Release of Noradrenaline from the, by Acetylcholine (K W Brandon and Helen Boyd), 880
Spleen Cell Injection (Homologous), in Adult Mice Acquired Tolerance to Homografts produced by (Ronald D Guttmann and J Bradley Aust), 564
Spleen Cells Transfer of Immediate (Anaphylactic) Hypersensitivity by Homologous Bone Marrow or (Dr V Stanković and S Vlahovic), 762
Splitting (Hyperfine) Nuclear Spin of Protoactinium-231 from (E W T Richards, A Ridgeley, N J Atherton and H S Wise), 444
Spores of various Filamentous Fungi Formation of 2-Heptanone from Caprylic Acid by (R F Gehrig and Prof S G Knight), 1185
Spots (Paper Chromatographic) Combustion Analysis of (H Soep), 67
Spotswood, Dr T M At the Third Australian Spectroscopy Conference (Formation of Charge Transfer Complexes during the Bromination of forms of Carbon known to contain relatively High Proportions of Aromatic Structures), 928
Spotts, Dr Charles R and Stanier, Prof R Y Mechanism of Streptomycin Action on Bacteria—a Unitary Hypothesis, 633
Spraragen, Sanford C , and others Prolonged Biological Half-Life of Sodium-22 in Patients with Essential Hypertension, 267
Sprent, J F A , and others Precipitating Antibodies in the Carpet Snake against Parasitic Nematodes, 996
Spring, Dr K H Thermionic Generation of Electricity, 611
Springs The Hidden—an Enquiry into Extra-Sensory Perception (Renée Haynes), *review* by Dr E J Dingwall, 4
Springs (Hot), of Tiberias (Israel) Thermophilic Micro-organism of Uncertain Taxonomic Status from the (David Kahan), 1212
St Bartholomew's Hospital Medical College, London Appointment of Dr J P Quilliam to the newly created chair of pharmacology, 210
  Appointment of Dr F W O'Grady as reader in bacteriology, 1132
Stability Nuclear Reactor (Dr A Hitchcock), *review* , 203
Stability of Dextran during Prolonged Storage (Dr W d'A Maycock and Dr C R Ricketts), 174
Stability in the Presence of Bacteria Serum β-Globulin Types in Red Deer and other Species and their (V P W Lowe and E I McDougall), 983
Stability of Transition-Metal Complexes Cation Toxicity and the (Dr William H R Shaw), 754
Stabilizer of Aqueous Solutions of Ascorbic Acid Rubeanic Acid as (Aleksandra Smoczkiewiczowa and Janina Grochmalicka), 161
Stacey, Prof M , and others Mannosyl D-Glucosamine Hydrochloride Isomers—6-O-Mannosyl D-Glucosamine Hydrochloride (143, July 8, 1961), *erratum*, 710
Stafford, Dr G H Proceedings of the 1960 Annual International Conference on High Energy Physics at Rochester, *review*, 7
Stage (Juvenile), in Cultivated Forms of *Brassica oleracea* (Dr L G G Warne), 889
Stages of *Eimeria* in Tissues Limitations of the Periodic Acid–Schiff Technique for the Demonstration of (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Stages (Extra- and Intra-cellular), of Gregarine and Coccidian Protozoa Periodic Acid–Schiff Technique for the Demonstration of (Dr J B Jennings), 473
Stages (Radiosensitive), in the Spermatogenesis of *Drosophila melanogaster* (V A Strangio), 781
Stahl, F (Weigle, J , and) Structure, Synthesis and Function of Deoxyribonucleic Acid (Code and Replication), 25
Staining Properties of Stressed Bone (Prof M A MacConaill), 368
Stainsby, G , and others At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (Experiments to break the Insolubilizing Cross-links of Mature Bovine Collagen after Alkaline Pretreatment), 613
Stammesgeschichte Grossablaufe der (Prof Arno Hermann Muller), *review* by Dr L R Cox, 3
Stammler, Dr M , and others Kinetics of Reaction of the Decomposition of Lead Azide, 626
Stamp, Prof L Dudley Agricultural Problems in Developing Countries (Climatic Limitations to Development in the Tropics), 1029
Stamp, Prof L Dudley (edited by) A History of Land Use in Arid Regions (Unesco Arid Land Research No 17), 1236
Stanbury, P J Comparison of the Mitochondria of the Small Intestine of Vertebrates, 67
Standard Work (A New), on Cocoa, *review*, 592
Standards, United States National Bureau of Appointment of Dr Ralph P Hudson as head of the Heat Division, 309
  Appointment of Dr Y Beers as chief of the Millimeter-Wave Research Section, 403
  Appointment of Dr R P Madden to the Atomic Physics Division, 507
  Appointment of Dr F Ralph Kotter as chief of the newly established High Voltage Section of the Electricity Division, 710
  Appointment of Dr Thomas R Lawrence as a member of the Metrology Division, 710
  1962 International Conference on Precision Electromagnetic Measurements, 922
  Appointment of J R Johler as chief of the new Applied Electromagnetic Theory Section, 1129
Standards Laboratories National Conference of, 1240
Standards (Photometric), and the Unit of Light (J S Preston), (National Physical Laboratory, Notes on Applied Science No 24), 1250
Standards and Measurements Radiometric (E J Gillham), (National Physical Laboratory, Notes on Applied Science No 23), 1250
Stanford–Pacific Naval Laboratory Conjugate Point Experiment (J E Lokken, J A Shand, Sir C S Wright, L H Martin, N M Brice and R A Helliwell), 319
Stanford University Stanford Studies in Mathematics and Statistics, No 2, Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling (edited by Ingram Olkin S G Ghurye, Wassily Hoeffding William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
Stanier, Prof R Y (Spotts, Dr Charles R , and) Mechanism of Streptomycin Action on Bacteria—a Unitary Hypothesis, 633
Stanier, Prof R Y and others Biosynthesis of Carotenoids in Purple Bacteria—a Re-Evaluation based on Considerations of Chemical Structure, 1168
Stankovic, Dr V and Vlahovic, S Transfer of Immediate (Anaphylactic) Hypersensitivity by Homologous Bone Marrow or Spleen Cells, 762
Staphylococcus aureus Acid-soluble Nucleotides of—Massive Accumulation of a Derivative of Cytidine Diphosphate in the Presence of Penicillin (Dr J J Saukkonen), 816
  Isolation of Histones (?) from (Dr H J Cruft and J L Leaver), 556
Staphylococcus aureus (Type 81) Effect of Phagocytosis on the Lysis of, by Bacteriophage (Dr J M McKenna and R P Sanderson), 570
Staphylococcus pyogenes Acid Extract of Leucocytes and (A G Towers), 272
Starch (Crystalline Type of), in Soybean Seedlings Effect of Temperature during Germination on the (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
Starch-Gel Electrophoresis Comparison of the Serum Protein Fractions of the Developing Chicken Embryo by the Technique of (A Amin), 356
  Resolution of Pathological Human Gamma-Globulins by (J P Binette and K Schmid), 732
Starch Gel Electrophoresis of Hen Egg White, Oviduct White, Yolk, Ova and Serum Proteins (Dr F Steven), 972
Stark Broadening of the Spectrum Line 4603 Å of Lithium (K C Lapworth), 252
Starved and Normal Guinea Pigs Variation in Lyoglycogen in (W J C Wilkinson and J H Kugler), 466
Stasis (Kinetin-induced Meiotic-Prophase Acceleration and), in *Tradescantia* Anthers cultured in Media Deficient in Sugar (Prof G W R Walker and J Dietrich), 889
State and the Freedom of the University, 212
State of Food and Agriculture, 1961 (United Nations, Food and Agriculture Organization), 1028

State University of Iowa Grant of 498,000 dollars from the United States National Science Foundation, for a 5 5-MeV Van de Graaff machine, 1239
Statistical Model for Chemists (Edward L Bauer), *review* by Dr D T Lewis, 102
Statistics An American Tapestry of, *review* by Dr D E Barton, 846
  Contributions to Probability and—Essays in Horor of Harold Hotelling (edited by Ingram Olkin, S G Ghurye, Wassily Hoeffding, William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
Statistics, Theory of Error and Design of Experiment A Chemist's Introduction to (Dr D A Pantony), 213
Statistics (Fire), 1960 United Kingdom—Statistical Analysis of Report of Fires attended by Fire Brigades in the United Kingdom during 1960, 1131
Status (Uncertain Taxonomic) Thermophilic Micro-organism of, from the Hot Springs of Tiberias (Israel), (David Kahan), 1212
Staveley, Ronald (edited by Raymond Irwin and) The Libraries of London, second edition, *review* by R Brightman, 592
Steblay, Dr Raymond William Closely Related Antigens in Human Placenta and Kidney, 1259
Stedman Fifty Years of, *review* by Dr K M Hawkins, 1222
Stedman's Medical Dictionary, twentieth edition, *review* by Dr K M Hawkins, 1222
Steedman, Dr H F Section Cutting in Microscopy, *review* by Dr S Bradbury, 904
Steel, John Y (Barnard, jur , A J , and) Progress in Microchemical Methods and Techniques, 410
Steel, Prof Robert W Applied Geography, 715
Steele, J E Occurrence of a Hyperglycaemis Factor in the Corpus Cardiacum of an Insect, 680
Steere, R L (Ackers, G K , and) A Cell for Rapidly Measuring Restriction to Diffusion of Macromolecules through Agar Gels of various Pore Sizes, 436
Stein, J A , and others Deiodination of Thyroxine-^{131}I in Tumour-bearing Rats, 1303
Steinberg, Dr Hannah, and othes Modification of the Effects of an Amphetamine–Barbiturate Mixture by the Past Experience of Rats, 533
Steinbuch, Dr M , and Loeb, Dr J Isolation of an α_2-Globulin from Human Plasma, 1196
Steiner, Dr Robert F , and Beers, Jr , Dr Roland F Polynucleotides—Natural and Synthetic Nucleic Acids, *review* by Dr C B Reese, 836
Steiner, Dr R F , and Edelhoch, H Influence of *p*H and Urea on the Ultra-violet Fluorescence of several Globular Proteins, 873
Stem (Pea) Sections Effect of Auxin on the Osmotic Value in (Shizuko Yoda and Joji Ashida), 577
Stem (Plant) Structure of the, in relation to Adventitious Rooting (A Beryl Beakbane), 954
Stenosis of the Extracranial Cerebral Arteries Cerebral Infarction—the Role of (Dr Peter O Yates and Dr Edward C Hutchinson), (Medical Research Council, Special Report Series No 300), 319
Stent, G Structure, Synthesis and Function of Deoxyribonucleic Acid (Induced Changes in DNA), 25
Stephen, Dr William I The Laboratory of the Government Chemist, 122
Stereology, International Society for, 115
Stereotaxic Procedures for Parkinsonism Arrest of Acceleration of Speech evoked by Thalamic Stimulation in the Course of (Dr G Guiot, and collaborators), 921
Sterling, H F , and Warren, R W A Cold Crucible for High-Temperature Melting Processes, 745
Sterman, M M (Swellengrebel, Dr N H , and) Animal Parasites in Man, *review* by Dr G Lapage, 197
Stern, Dr Margaret I Female Rat Preputial Glands as a Source of β-Glucuronidase, 359
Steroidogenesis Enhancement of, by Rat Adrenal Slices *in vitro* with Œstradiol-17-β (Prof Julian I Kitay), 358
Steroids Gas Chromatography of Androst-16-en-3α-ol and related (R W R Baker and Dr D B Gower), 1074
  Group Retention Factors in the Gas–Liquid Chromatography of (R B Clayton), 524
Sterols other than Cholesterol Persistence of, in Chicken Tissues (David Kritchevsky and Vittorio Defendi), 71
Steven, Prof D M Shoaling Behaviour in a Mysid, 280
Steven, Dr F Starch Gel Electrophoresis of Hen Egg White, Oviduct White, Yolk, Ova and Serum Proteins, 972
Stevens, Dr B Evidence for the Photo-Association of Aromatic Hydrocarbons in Fluid Media, 724
Stevenson, F M Companionship of the Textile Institute awarded to, 406
Steward, Prof F C Prof A J Eames and the Morphology of the Angiosperms, 8
Steward, S F At the British Electrical Power Convention (British Electrical Manufacture in the National Economy), 502
Stewart, A D G Scanning Techniques in Biological and Medical Microscopy (An Ion Gun built into an Electron Scanning Microscope, to produce Etching of a Specimen Surface during Continuous Electron Imaging), 1031
Stewart, Dr Babette T (Stewart, Dr Peter A , and) Circular Streaming Patterns in a Slime-Mould Plasmodium, 1206
Stewart, C M , and others Seasonal Variation in Alginic Acid, Mannitol, Laminarin and Fucoidin in the Brown Alga, *Ecklonia radiata*, 1208
Stewart, Dr G T Some Physico-Chemical Properties of Paracrystalline Spherulites of Biological Origin 624
Stewart, Dr Peter A , and Stewart, Dr Babette T Circular Streaming Patterns in a Slime-Mould Plasmodium, 1206
Stewart, P A E Astronautics (Advanced Propulsion Systems for Space), 312
  At the Twelfth International Astronautical Congress (An Examination of the Characteristics of Propulsion Systems for Inter-Orbital Transfer), 1244
Stewart, Robin K , and others Intestinal Proteinases in an Insect, *Calliphora vomitoria* L , 999
Stickland, Dr L H Enzymes and Cancer, *review*, 100
Stickleback (Nine-spined and the Three-spined) Serological Relationships between the (Tadeusz Penczak) 673
Stigmas Influence of the Age of Pollen and, on Sex Determination in Hemp (Regina Laskowska), 147
Stilboestrol Dipropionate Seminal Degeneration induced in Merino Rams by the Administration of (G R Moule and P E Mattner), 364
Stimulants (Smooth Muscle) Effect of some, on the Motor Response of the Isolated Guinea Pig Vas Deferens to Hypogastric Nerve Stimulation (Dr Nils O Sjostrand), 1190
Stimulating Hormone (Sheep Interstitial Cell) Complement-fixing Antibodies to Human Growth Hormone and (Allen Trenkle, N R. Moudgal, Katy K Sadri and Dr Choh Hao Li), 260
Stimulation with Œstrogens Response of the Reticulo-Endothelial System to (Prof T Nicol, D L J Bilbey ,J Cordingley and C Druce), 978
Stimulation of Uptake of Calcium-45 in the Adrenal Gland by Acetylcholine (Prof W W Douglas and A M Poisner), 1299
Stimulation (Electrical), of Reticular Formation Effects of, on the Lactic Acid Content of the Rat Brain (Dr Lj Mihailovic, Lj Krzalić and D Cvetkovic), 1166
Stimulation (Hypogastric Nerve) Effect of some Smooth Muscle Stimulants on the Motor Response of the Isolated Guinea Pig Vas Deferens to (Dr Nils O Sjostrand), 1190
Stimulation (Non-Redundant) Visual Effects of (Prof D M MacKay), 739
Stimulation (Self-) of the Brain Effect of X-Irradiation on (Dr Thomas J. Haley, P Bach-y-Rita an N Komesu), 1309
Stimulation (Thalamic), in the Course of Stereotaxic Procedures for Parkinsonism Arrest of Acceleration of Speech evoked by (Dr G Guiot, and collaborators), 921
Stimuli (Taste) Response of Catfish Barbels to (Hideki Tateda), 343
Stimulus (Driving) Effects of Intensity of, on the Shape of Membrane Action Potential of the Heart (T Azuma, H Hayashi, T Kanno and K Matsuda), 1295
Stimulus-secretion Coupling Mechanism of Nicotinic Action at the Adrenal Medulla—Calcium as a Link in (Prof W W Douglas and R P Rubin), 1087
Stock A H , and Uriel, José Esterase of Group *A* Streptococci—Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins *O* and *S* in Agar-Gel, 435
Stock, A H , and others Extracellular Esterase of Group *A* Streptococci—Esterase in Extracellular Concentrates of Group *A* Streptococci and the Homologous Antibody, 434
Stock, R (Freeguard, G F , and) Partition Isotherms and Gas-Liquid Chromatography, 257
Stocken, Dr L A (Hudnik-Plevnik, T , and) Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with Ultra-Violet, 554
Stoker, Prof M Mechanisms of Virus Infections (Intracellular Replication Mechanisms), 1246
Stolk, Prof A Role of Cell Division in Gastrulation of the Viviparous Toothcarp *Xiphophorus helleri*, 374
  Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of Herring-Sperm Deoxyribonucleic Acid, 1215
Stollery, J L Appointed to the readership in aeronautics at the Imperial College of Science and Technology, London, 922
Stolzy, Lewis H (Leggett, James E , and) Anaerobiosis and Sodium Accumulation, 991
Stomopneustes variolaris (Lamarck) (Sea Urchin) Isolation of Echinochrome *A* from the Spines of the (Dr K Nishibori), 1293
Stoneley, Dr R The Halley Bay Expedition of the Royal Society, *review*, 1004
Stopping-Power Ratio for Cavity Ionization Chambers Measurement of (T E Burlin), 545
Storage of Freeze-dried *Serratia marcescens* Free-Radical Formation during (Dr R L Dimmick, R J Heckly and D P Hollis), 776
Storage (Food) Toxic Chemicals in Agriculture and, 1130
Storage (Prolonged) Stability of Dextran during (Dr W d'A Maycock and Dr C R Ricketts), 174
Stored Food-Grains Pre-Harvest Prophylaxis for Infestation Control in (S K Majumder, K Krishnamurthy and S Godavari Bai), 375
Storey, Dr H At the Thirteenth Congress of the International Union of Forest Research Organizations (Forestry Influences), 614
Stoutemyer, Prof V T (Goodir, J R , and) Effect of Temperature and Potassium Gibberellate on Phases of Growth of Algerian Ivy, 677
Stove, E R , and others New Penicillins Stable towards both Acid and Penicillinase, 1183
Strachey, C Scientific Side of Computer Language, 22
Strain Recovery in Wood Effect of Temperature on the (Maciej Lawniczak and Jan Raczkowski), 583
Strains of *Neurospora crassa* Effect of Kinetin on the Fertility of some (Barry O Lee), 288
Strands (Transcellular), and Particle Movement in Mature Sieve Tubes (Dr. R Thaine), 772
Strangers' Hall, Norwich, 1132
Strangio, V A Radiosensitive Stages in the Spermatogenesis of *Drosophila melanogaster*, 781
Stratospheric Fission Products Transfer of, into the Troposphere (D H. Peirson), 497
Stratospheric Water Origin of High Tritium Content of Atmospheric Methane, Hydrogen and (Dr Richard Wolfgang), 1279
Stratton, G Burder (edited by, assisted by Marcia A Edwards) The Zoological Record, Vol 95, Records of Zoological Literature relating chiefly to the Year 1958, *review* by Dr Edward Hindle, 903
Streaming Patterns (Circular), in a Slime-Mould Plasmodium (Dr Peter A. Stewart and Dr Babette T Stewart), 1206
Street, Prof H E Biology in Britain, 416
Streptococci (Group *A*) Esterase in Extracellular Concentrates of, and the Homologous Antibody (Extracellular Esterase of Group *A* Streptococci), (Aaron H Stock, Jose Uriel and Pierre Grabar), 434
  Extracellular Esterase of—Esterase in Extracellular Concentrates of Group *A* Streptococci and the Homologous Antibody (Aaron H. Stock Jose Uriel and Pierre Grabar), 434 , Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins *O* and *S* in Agar-Gel (A H Stock and Jose Uriel), 435
Streptolysins *O* and *S* in Agar-Gel Electrophoretic Mobility and Detection of Haemolytic Activity of (Extracellular Esterase of Group *A* Streptococci), (A H Stock and Jose Uriel), 435
Streptomyces rimosus Possible Causes for Production of Isoleucine by (Dr I Horvath, I Gado and A Szentirmai), 641

Streptomycin Action on Bacteria Mechanism of—a Unitary Hypothesis (Dr Charles R Spotts and Prof R Y Stanier), 633
Stresemann, E (Herxheimer, H , and) Anti-Asthmatic Effect of Phenazone and Amidopyrine, 1089
Stress in Cattle Diuresis due to (R S Anderson), 460
Stress Concentration Effects in Tertiary Creep (Dr P W Davies and B Wilshire), 1281
Stress (Histamine) Effects of Thymectomy on the Resistance of Rats to Drowning and (Dr A S Weltman and A M Sackler), 460
Stress (Mechanical) Effect of, on some Solid-State Polymerizations (Dr C H Bamford, Dr G C Eastmond and Dr J C Ward), 1036
Stress Fatigue (High- and Low-) Difference between (N E Frost), -46
Stressed Bone Staining Properties of (Prof M A MacConaill), 368
Stresses and Friction Effective Contact (Dr D H Trollope), (July 22, 376), *errata*, 213
Stretch, Dr R Animal Behaviour (Experiments on the Early Experience of Animals), 209
Strong Electrical Fields Effect of on the Boiling Points of some Alcohols (Richard K Lyon), 1285 (Dr P K Katti and M M Chaudhri) 1286
Strontium-99 (Caesium-137 and), in Precipitation, Soil and Animals in Norway (T Hvinden and A Lillegraven), 1144
Stroud, Dr D B E , and others Mannosyl D-Glucosamine Hydrochloride Isomers—6-O-Mannosyl D-Glucosamine Hydrochloride (143, July 8, 1961), *erratum*, 710
Structural Concrete (Prof Kurt Billig), *review* by Prof A W Hendry 7
Structural Investigation of a Laminaran isolated from *Eisenia bicyclis* (Nobuhiko Handa and Prof Kazutosi Nisizawa), 1078
Structural Polysaccharides of Algal Cell Walls Variants in the (Dr Eva Frei and Prof R D Preston), 939
Structure Wool (Australian Commonwealth Scientific and Industrial Research Organization Wool Colloquium No 1), 709
Structure of Alpha-Keratin (Prof S Krimm), 810
Structure of Asparagine Monohydrate (G Kartha and A de Vries), 862
Structure of the 5,6-DimethylBenzimidazolylcobamide Coenzyme (Dr P Galen Lenhert and Dorothy Crowfoot Hodgkin), 937
Structure of the Eye—Proceedings of the Symposium held during the Seventh International Congress of Anatomists, New York, 1960 (edited by George K Smelser), *review* by Dr E N Willmer, 295
Structure of Metals before 1890 A History of Metallography—the Development of Ideas on the (Prof Cyril Stanley Smith), *review* by Prof F C Thompson, 843
Structure of Molybdenum Sesquisulphide (Prof F Jellinek), 1065
Structure of the Oxygen-carrying Cobalt (II) Histidine Complex (A Earnshaw and L F Larkworthy), 1068
Structure of the Plant Stem in relation to Adventitious Rooting (A Beryl Beakbane), 954
Structure, Life-History and Distribution of *Gnetum*, *review* by Dr C R Metcalfe, 1006
Structure (Antigenic), of *Entamoeba histolytica* (A Sen, S N Ghosh, S Mukerjee and J C Ray), 893
Structure (Chemical) Biosynthesis of Carotenoids in Purple Bacteria—a Re-Evaluation based on Considerations of (Synnøve Liaaen Jensen, Dr Germaine Cohen-Bazire and Prof R Y Stanier), 1168
Structure (Crystal), of 2,5-Dimethyl-Dithio-Furophthene, a Homologue of Thio-Thiophthene (Dr M Mammi, R Bardi, G Traverso and S Bezzi), 1282
Structure (Crystal), of 2-Phenylazulene (Prof B D Sharma and J Donohue), 863
Structure (Crystal) Analysis The Theory of (A I Kitaigorodskii), translated from the Russian by David and Katherine Harker, *review* by Dr M M Woolfson, 904
Structure (Crystal and Molecular), of Diphenyl (Dr G B Robertson), (August 5, 593), *erratum*, 1026
Structure (Fine), of the Arteriolar Nerves in the Guinea Pig Pancreas (Dr J D Lever and Dr A C Esterhuizen), 566
Structure (Fine), in Jovian Decametric Radiation Presence and Correlation of (James N Douglas and Harlan J Smith), 741
Structure (Fine), of Viruses (Electron Microscope Society of America Symposium on), 611
Structure (Molecular), and Spectroscopy (Ohio State University Symposium on), 1241
Structure (Nuclear) Proceedings of the International Conference on (Kingston, Canada, 1960), edited by D A Bromley and E W Vogt, *review* by D L Allan, 203
Structure (Population) Molecular Biology and (British Association for the Advancement of Science, Section D (Zoology) and Section K (Botany), Joint Symposium on), 414
Structure and Properties of the Flavohaemoprotein, Cytochrome b_2 (L(+)-Lactate Dehydrogenase of Baker's Yeast), and of Haemoprotein, Flavoprotein and Apoprotein Derivatives (Prof R K Morton), 727
Structure, Synthesis and Function of Deoxyribonucleic Acid (Société de Chimie Physique Discussion on), 24
Structures (Crystal), of Salts of Methylated Purines and Pyrimidines (R F Bryan and K Tomita), 812
Structures and Conformations of some Naturally Occurring Derivatives of Proline (R J Abraham, K A McLauchlan, Shirley Dalby, Prof G W Kenner, R C Sheppard and L F Burroughs), 1150
Stuart, Dr J T Promoted to Senior Principal Scientific Officer, 214 , work of, 214
Stuchlíkova, E , and others Agarophoresis and Immuno-electrophoresis of the Proteins of Gastric Juice, 763
Student Mental Health—Report of a Conference held in London, 1961 (World University Service), 620
Students for Technical Experience International Association for the Exchange of Fourteenth Annual Report, 1130
Students for Technical Experience, International Association for the Exchange of (United Kingdom) Report for 1960-61, 1131
Studentships (Research) Senior Research Fellowships, Research Fellowships and (Zoological Society of London), 211
Studies in Endocrinology, *review* by Sir Solly Zuckerman, 834
Studies in Paleobotany (Prof Henry N Andrews, Jr), *review* by Dr Alan Wesley, 852
Studies (Alcohol), Center for Transferred from Yale University to Rutgers State University, 404
Studies (Case) The Preparation and Use of (South London Branch of the British Institute of Management Conference on), 21
Studies (Folk-Life), Society for Establishment of the, 19
  Election of Officers, 19
Studies (Gas Dynamic) Bibliography of Tables and Charts for Use in (D E Randall), 308
Studies (Nucleotide Sequence) Specific Partial Hydrolysis of Nucleic Acids in (Dr D W Verwoerd, Dr H Kohlhage and Dr W Zillig), 1038
Studies (Selected), in Chemical Kinetics (Prof Farrington Daniels), *review* by Prof J M Coulson, 297
Studies (Spectroscopic), using Time-Resolved Techniques (Institute of Physics and the Physical Society Conference on), 1032
Study of the Desk Worker Morale in the Civil Service, a (Nigel Walker), 1003
Study of Development and Growth, Society for the Symposium on Cytodifferentiation and Macromolecular Synthesis, 802
Study of Diabetes, *review*, 391
Study of Fast Reactions (Cambridge Physical Chemistry 1961 Summer School), 1136
Study of Social Insects, International Union for the Fourth Congress, 801
Study (Autoradiographic), of Cell Migration during Histogenesis of Cerebral Cortex in the Mouse (Dr J B Angevine jun , and R L Sidman), 766
Stuntz, Daniel E , and others Occurrence of Sedoheptulose in Carpophores and Basidiospores of *Inocybe* Species, 1080
Sturrock, Prof P A Spectral Characteristics of Type II Solar Radio Bursts, 58
Sub-cellular Component of *Corynebacterium diphtheriae* having the Capacity to Bind Anti-Toxin (Prof M Yoneda and M Matsuda), 642
Sub-Cellular Fractions of various Regions of the Central Nervous System of the Rat Distribution of Ribonucleic Acid in (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
Sub-Cellular Particles Simplified Technique for Isolation of (Dr David W E Smith), 234
Sub-Cellular Particles isolated from the Hepatopancreas of *Carcinus maenas* Respiratory Chain Phosphorylation in (Dr R B Beechey), 975
Sub-Fractionation (Chromatographic), of Human 7S γ-Globulin Serological Evidence of a (Ulf Nilsson), 1301
Sub-Groups (Quantitative), of the *B* Antigen in Man and their Occurrence in Three Racial Groups (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Sub-Lingual Temperatures of Heat-acclimatized People Heart-rates and the (Dr G C Whittow), 1086
Sub-molecular Biology Introduction to a (Prof Albert Szent-Gyorgyi), *review* by Prof D D Eley, 852
Sub-Nuclear Preparations from Rat Liver Nuclei Incorporation of ^{14}C-Glycine by (K R Rees, Hazel F Ross and G F Rowland), 171
Subbarayappa, Dr B V History of Sciences in Ancient and Medieval India (Indian Atomism), 27
Sublimation of Ice Crystals at Low Temperatures Investigation with the Electron Microscope of the (Prof Tokio Nei), 1177
Submerged Culture Production of Lysergic Acid α-Hydroxyethylamide by *Claviceps paspali* Stevens and Hall Formation of 2,3-Dihydroxybenzoic Acid in Fermentation Liquors during the (F Arcamone, Prof E B Chain, A Ferretti and P Pennella), 552
Suboxide (Carbon) Pyrolytic Carbon Formation from (B C Banerjee, T J Hirt and Prof P L Walker, jun), 450
Substance (New Ninhydrin-Reactive), from Red Algae (Mitsuo Kuriyama), 969
Substance (Slime) Production of, in Mixed Cultures of *Rhodopseudomonas capsulatus* and *Azotobacter vinelandii* (Prof Azuma Okuda and Michiharu Kobayashi), 1207
Substances Effect of Gibberellic Acid, Kinetin and other, on Seed Dormancy (B Frankland), 678
  Exchange of, between the Blood and Tissues (Sir Howard Florey), 908
Substances controlling the Rate of Beating of the Heart of *Periplaneta* (K G Davey), 284
Substances (Histamine-like) Formation of Histamine and, from Histidine by Quartz Dust (L W Marasas), 872
Substances (Plant Phenolic) Biochemistry of (Plant Phenolics Group of North America Symposium on), 418
Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
'Substrate-Substitute' Crystallization of the Complex of D-Amino-Acid Oxidase and (Kunio Yagi and Takayuki Ozawa), 70
Substrates Response of Chloroplast Cytochromes to Light and (Prof H Lundegardh), 243
Substractive Gas Chromatography Behaviour of 5A Molecular Sieve in (E R Adlard and B T Whitham), 966
Succinic Dehydrogenase (Nucleolar), in Mouse Mammary Carcinoma Cells (P De, R Chatterjee and Dr S Mitra), 285
Sudarshan, E C G , and others (edited by) Proceedings of the 1960 Annual International Conference on High Energy Physics at Rochester, *review* by Dr G H Stafford, 7
Suelter, Dr C H , and others Detection of a Possible Intermediate in Oxidative Phosphorylation, 43
Suess, Prof H E , and others Isotopic Composition of Atmospheric Hydrogen and Methane, 648
Sugar Kinetin-induced Meiotic-Prophase Acceleration and Stasis in *Tradescantia* Anthers cultured in Media Deficient in (Prof G W R Walker and J Dietrich), 889
Sugar Metabolism (Fat and), in Infant Rats Interrelationship between (P Hahn, O Koldovsky, V Melichar and M Novak), 1296
Sugar Reagent (Improved Benzidrine), for Paper Chromatograms (Bock G Chan and Prof J C Cain), 69
Sugden, Dr T M The Study of Fast Reactions (Recent Developments in the Collision and Transition State Theories), 1136
Sullivan, Dr J V , and others At the Third Australian Spectroscopy Conference (Factors affecting the Cathodic Sputtering of various Metals), 929
4-Sulphanilamido-6-methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,536)—Two New Long-acting Sulphonamides (Dr R Clarkson and Dr A R Martin), 523
Sulphate Transport and Metabolism by *Desulphovibrio desulphuricans* (Prof C Furusaka), 427
Sulphate (Ammonium) Behaviour of Neutron-Irradiated, on Thermal Annealing (Dr Nikola Getoff and Masaru Nishikawa), 62

Sulphate Retention by Acid Soils Nature of (Monica Liu and G W Thomas), 384
Sulphides (Lead and Zinc) Recrystallization of (Dr J C Nixon, J D Hayton, D C Lawrie and A E Tynan), 516
Sulpholipids Phospholipids and (Biochemical Society and the British Biophysical Society Joint Discussion on), 807
Sulphonamides (Long-acting) 4-Sulphanilamido-6-Methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,526)—Two New (Dr R Clarkson and Dr A R. Martin) 523
α-Sulphoquinovosides Hydrolysis of, by β-Galactosidase (Isao Shibuya and Prof A A Benson), 1186
Sulphosalicylo-soluble Proteins Preparation and Determination of, using Tannin (W Mejbaum-Katzenellenbogen, W Dobryszycka and B Morawiecka), 262 , *erratum*, 802
Sulphur Amino-Acids Effects of the, on the Vitamin A Content in Liver of Rats (Tatsuo Koyanagi and Satoshi Odagiri) 168
Sulphydryl Groups Interaction of the Carcinogenic *N*-Methyl-Nitrosourethane with (Dr R Schoental), 670
Sulphydryl (Liver) Levels in Mice Riboflavin and (Dr G Calcutt, D Doxey and Joan Coates), 164
Summer School in Analytical Chemistry at the Manchester College of Science and Technology (Royal Institute of Chemistry), 608
Summer School in Theoretical Chemistry (University of Oxford), 609
Summerhayes, V S Peruvian Orchids 719
Sun–Earth Relations and Associated Periodicities (Irvine Paghis), 346
Sundberg Prof V At the Thirteenth Congress of the International Union of Forest Research Organizations (Operational Efficiency), 615
Sundblad, Lars and others Permeability of the Synovial Membrane to Glyco-proteins, 1192
Sunspot Number Atmospheric Scale Height as a Modifying Influence on Linear Trend of *F*-Region Electron Density with (Jean M Bullen), 542
Sunspots (Short-lived) Secular Variations of (T S Ringnes), 151
Supply Water (Prof Jack Hurshleifer, James C de Haven and Prof Jerome W Milliman) *review* by Prof W G V Balchin, 853
Suppression Amblyopia Re-educative Treatment of (Being an abridged English version of Jean Sédan's 'Post Cure de l Amblyope Rééduqué'), (T Keith Lyle, Cynthia Douthwaite and Jill Wilkinson), *review* by Prof O L Zangwill, 695
'Suramin' Inhibition of Lysozyme by (Dr Iwo Lominski and Samuel Gray), 683
Surface of Ascites Tumour Cells Intracellular Response to an Iso-immune Reaction at the (D C Dumonde, Clarice G Walter, Lucille Bitansky, Prof G J Cunningham and J Chayen), 1302
Surface Charge and Coagulant Action of Phospholipids A Correlation between (Dr A D Bangham), 1197
Surface Granulation in Myeloid Leucocytes (Dr A D McCutcheon), 684
Surface Potential (Electrical), of Red Blood Cells Agglutination and the (P Sachtleben and Prof G Ruhenstroth-Bauer), 982
Surface Properties of Silver Iodide (Prof A C Zettlemoyer, Noubar Tcheurekdhian and J J Chessick), 653
Surface Temperature (Sea) in Coastal Waters of the British Isles (F E Lumb), 153
Surface Waters of the Sea Bioluminescence in the (Richard H Backus, Charles S Yentsch and Asa Wing), 518
Surfaces Riemann (Prof Lars V Ahlfors and Prof Leo Sario), *review* by Prof W K Hayman, 847
Surfaces (Riemann) Analysis on, *review* by Prof W K Hayman 847
Surgery (Pupal Brain) Effect of, on the Rocking Response of *Automeris* (Dr A D Blest), 573
Survey of Antibiotic Literature, *review* by Dr B K Kelly, 589
Survey of Astronomy, *review* by Dr A Danjon, 838
Survey of Extra-Sensory Perception, *review* by Dr E J Dingwall, 4
Survey of New Penicillins (Prof Robert Knox), 492
Survey (A Spectroscopic) of English and Continental Medieval Glazed Pottery (L C Thomas and J W G Musty), 1143
Surveys (Epidemiological), on Chagas' Disease in the Village of Matalaque, Southern Peru (Felix Naquira, Eleazar Cordova, Cesar Naquira and Enrique Rubin de Celia), 921
Surveys (Geophysical) Interpretation of (Royal Astronomical Society and the Geological Society Geophysical Discussion on), 1242
Survival of *Rhizobium* on Clover Seeds (J F Loneragan, D V Moye and A J Anderson), 526
Survival of *Rhizobium meliloti* in Soil Culture (H L Jensen), 682
Susceptibility of Hamsters to the Oral Administration of *Mycobacterium johnei* (N J L Gilmour and J G Brotherston), 1202
Suslov, S P Physical Geography of Asiatic Russia (translated from the Russian by Noah D Gershevsky , edited by Joseph E Williams), *review* by Prof S I Tomkeieff, 200
Susskind Prof C , and Vogelhut, P O Microwave Measurement Techniques (Cavity-perturbation Measurements of the Effect of Microwave Radiation on Proteins), 408
Sutcliffe, Dr James F Electrolytes and Plant Cells, *review*, 831
Sutcliffe, Dr R C Changes of Climate, 1139
Sutherland, I W Appointed lecturer in bacteriology at the University of Edinburgh, 507
Suzuki, Keishi, and others 'Glycerol Effect' and the Mechanism linking Excitation of the Plasma Membrane with Contraction, 1159
Suzuta, Dr T (Mori, Dr W , and) Auto-Immunization and Liver Cirrhosis, 41
Svehla, G (Erdey, L , and) Microchemical Techniques (Chronometric Determination of Metal Ions based on their Catalysis of suitable Reactions), 411
Swain, Dr T (Bate-Smith, Dr E C , and) Wood Extractives (Systematic Distribution of Phenolic Substances in Plants) 511
Swallow, Dr J C Physical Oceanography, *review*, 101
Swaminathan, Dr M S , and Iyer, R D Skewed Recombination in a Rare Interspecific Jute Hybrid, 893
Swaminathan, Dr M S and Nambiar, M C Cytology and Origin of the Dwarf Coconut Palm, 85
Swan, Dr G A Biochemistry of Plant Phenolic Substances (Melanin and its Formation), 418
Sweany, Henry C Histoplasmosis, 114
Sweat Acetylcholine in, in Fibrocystic Disease of the Pancreas (Dr Edward L Eyerman, Dr Robert J Hurley and Dr Richard L Irwin), 77
Sweden The Red Deer in, 30
Swedish Seed Association (F R Horne), 110
Swedish Technical Assistance (Central Committee for), and others International Seminar for Research and Education in Physics, 709
Sweet Pea Lathyrism Dissecting Aneurisms of the Large Arteries of Chick Embryos due to (Z Zahoř and M Machova), 532
Swellengrebel, Dr N H , and Sterman, M M Animal Parasites in Man, *review* by Dr G Lapage, 197
Swierszczewski, Dr S Appointed to a Research Fellowship in nuclear physics in the University of Birmingham, 406
Swim Bladder of *Ophiocephalus striatus* (Bloch) Goblet Cells in the (A S Monie), 1313
Syenite–Marble Contact Formation of Pegmatitic Carbonatite in a (R D Schuiling), 1280
Sylvester Medal of the Royal Society awarded to Prof P Hall, 606, 906 ; work of, 906
Symbiosis (Legume) Temperature Characteristics of Bacterial Variation in (Dr J S Pate), 637
Symbiotic Nitrogen Fixation by Alder (*Alnus glutinosa* Gaertn) Molybdenum and (Dr J H Becking), 1204
Symons, D B A Appointed to a Research Studentship by the Zoological Society of London, 211
Symons, Prof M C R Spectroscopic Studies using Time-Resolved Techniques (Use of Electron Resonance in Identifying the Products of Radiation Damage in some Inorganic Oxy-salts), 1034
Sympathetic Nerve-Endings Fate of Tritiated Noradrenaline at the (G Hertting and J Axelrod), 172
Synapses (Molluscan Central) Cholinergic Transmission Mechanisms for both Excitation and Inhibition in (Dr L Tauc and Dr H M Gerschenfeld), 366
Syndrome (Acute Aortic Embolism), in Cats Production of Aortic Occlusion resembling (Roy K Imhoff), 979
Synergetic Action of Polyethylene Glycol and Dyes Behaviour of Protozoa under the Influence of the (Leopold Rejniak and Prof Ludvik Komczynski), 1203
Synergid Haustoria of *Quinchamalium chilense* Lam (Saroj Agarwal), 1313
Synovial Fluid Presence of Haptoglobin in (Prof Otto W Neuhaus and Virginia P Sogoian), 558
Synovial Membrane Permeability of the, to Glycoproteins (Lars Sundblad, Dr Eric Jonsson and Erik Nettelbladt), 1192
Synthesis of Deoxyribonucleic Acid in Normal and Tumour Strain Cells Action of Radiation on (Dr John Seed), 944, *erratum*, 1241
Synthesis of Deoxyribonucleic Acid in Regenerating Rat Liver following Whole-body X-Irradiation Pituitary Effect on (the late D M Gould, K W Floyd, Prof R W Whitehead and J L Sanders), 1309
Synthesis of the Toxic Principle of *Dichapetalum toxicarium* (18-Fluoro-*cis*-9-Octadecenoic Acid), (Prof F L M Pattison and R E A Dear), 1284
Synthesis of Transferrin in the Foetus Genetical Evidence for (Dr A R Rausen, Dr P S Gerald and Dr L K Diamond), 182
Synthesis (Fatty Acid), in Liver and Yeast Systems Particle Involvement in (S Abraham, I L Chaikoff, W M Bortz, H P Klein and Halina Den), 1287
Synthesis (Macromolecular) Cytodifferentiation and (Society for the Study of Development and Growth Symposium on), 802
Synthesis (Microsomal Protein), produced by Dimethylnitrosamine Counteraction by Cysteine of Glycogenolysis and Inhibition of (Dr P Emmelot and I J Mizrahi), 42
Synthesis and Function (Structure,), of Deoxyribonucleic Acid (Sociéte de Chimie Physique Discussion on), 24
Synthesis and Organisation in the Bacterial Cell (Dr E F Gale), *review* by Dr S Dagley, 489
Synthesizing the Vitamin Biosynthesis of L-Ascorbic Acid—Missing Steps in Animals incapable of (I B Chatterjee, N C Kar, N C Ghosh, and Prof B C Guha) 163
Synthetic Detergents Fourth Progress Report of the Standing Technical Committee on (Ministry of Housing and Local Government), 1142
Synthetic Drugs Antibiotics and the Newer (Bradford Chemical Society, the Department of Chemical Technology of the Bradford Institute of Technology, and the Yorkshire Council for Further Education Symposium on), 1132
Synthetic Nucleic Acids Polynucleotides—Natural and (Dr Robert F Steiner and Dr Roland F Beers, Jr), *review* by Dr C B Reese, 836
Synthetic Polypeptide Derivatives Antibacterial (Dr K Kovacs, Dr A Kotai, I Szabo and R Mecseki), 190
Syper, L (Bobranski, B , and) Microchemical Techniques (Paper Chromatography applied to the Identification of Drugs containing Unsaturated Radicals following Reaction with Mercuric Acetate), 412
System (Acetylating Enzyme) from Pigeon Liver Inactivation of A-Methopterin by the (V Krishnamurthy and Beatriz M Braganca), 68
System (Air-filled Elastic) Oscillatory Flow in an (Group-Capt J E Malcolm), 875
System (Autonomic Nervous), and the Occurrence of Visceral Lesions (Hiroshi Itoh, Teizo Kasahara, Kazua Amano, Koh Okamoto and Samon Tanabe), 1025
System (Central Nervous), of the Rat Distribution of Ribonucleic Acid in Subcellular Fractions of various Regions of the (T Borkowski, S Harth, R Mardell and Prof P Mandel), 456
System (*Gm*) A Rare Phenotype within the (K Henningsen and Jørgen C Nielsen), 476
System (High-Speed Direct-Recording), for Electron Diffraction (Dr C W B Grigson), 647
System (*in vitro*) Importance of Cell Division for Antibody Production in an (R W Dutton), 462
System (New Renal Tubular Amino-Acid Transport), and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
System (Reticulo-Endothelial) Response of the, to Stimulation with Œstrogens (Prof T Nicol, D L J Bilbey, J Cordingley and C Druce), 978
System (A Warning), for Nuclear Accidents (Prof F W Spiers), 31
Systematic Measurement of Fall-out in Czechoslovakia up to 1961 (Prof W Santholzer, G Macku and J Podzimek), 398
Systematics of Man (Dr B G Campbell), 710
Systematics of Oriental Termites Contributions to the (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Systematics Association Lecture on the Systematics of Man (Dr B. G Campbell), 710

Systems (Electrolytic) Evaluation of Boundary Layer Thickness in, from Decay of Anode Concentration Polarization (Leonard Nanis), 449
Systems (Liver and Yeast) Particle Involvement in Fatty Acid Synthesis in (S Abraham, I L Chaikoff, W M Bortz, H P Klein and Halina Den), 1287
Szabo, I, and others Antibacterial Synthetic Polypeptide Derivatives, 190
Szent-Gyorgyi, Prof Albert Introduction to a Submolecular Biology, *review* by Prof D D Eley, 853
Szentirmai, A, and others Possible Causes for Production of Isoleucine by *Streptomyces rimosus*, 641
Szontagh, Prof F E, and others Primary Embryonal Sex Ratio in Normal Pregnancies determined by the Nuclear Chromatin, 476

TABLE of Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$$

for Complex Argument (V N Faddeyeva and N M Terent'ev), edited by V A Fok, (translated from the Russian by D G Fry), *review* by Prof C A Coulson, 97
Tables Mathematical, *review* by Prof C A Coulson, 97
Tables of Airy Functions and Special Confluent Hypergeometric Functions for Asymptotic Solutions of Differential Equations of the Second Order (A D Smirnov), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Tables of the Blue Sky Theory and, *review* by Prof Zdenek Kopal, 1005
Tables related to Radiation emerging from a Planetary Atmosphere with Rayleigh Scattering (Kinsell L Coulson, Jitendra V Dave and Zdenek Sekera), *review* by Prof Zdenek Kopal, 1005
Tables of the Riemann Zeta Function (C B Haselgrove, in collaboration with J C P Miller), (Royal Society Mathematical Tables, Vol 6), *review* by Prof C A Coulson, 97
Tables (Mach), for Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with Total Temperatures to 10,000° K (K L Goin), 308
Tables and Charts for Use in Gas Dynamic Studies Bibliography of (D E Randall), 308

  Ultra-Violet (Television Microscopy), (Dr R Barer and J Wardley), 1060
Temperature Effect of, on the Strain Recovery in Wood (Maciej Lawniczak and Jan Raczkowski), 583
Temperature of the Environment Flagellar Changes in *Escherichia coli* induced by (Dr Robert B Morrison and Jean McCapra), 774
Temperature during Germination Effect of, on the Crystalline Type of Starch in Soybean Seedlings (Dr Susumu Hizukuri, Michiko Fujii and Prof Ziro Nikuni), 239
Temperature and Potassium Gibberellate Effect of, on Phases of Growth of Algerian Ivy (J R Goodin and Prof V T Stoutemyer), 677
Temperature (Ambient), and Depot Fat Iodine Number in Children (I Macdonald), 363
Temperature (High-) Induction Furnaces Design of Laboratory (P H Dundas), 114
Temperature (High-) Melting Processes A Cold Crucible for (H F Sterling and R W Warren), 745
Temperature (Low) Carbonization of Non-caking Coals and Briquetting of Coal Fines (Regional Research Laboratory, Hyderabad, Symposium on), 406
Temperature (Sea Surface), in Coastal Waters of the British Isles (F E Lumb), 153
Temperature Characteristics of Bacterial Variation in Legume Symbiosis (Dr J S Pate), 637
Temperature Requirement (Alternating), for Germination Replacement of an, by Gibberellic Acid (J M Tager and Brenda Clarke), 83
Temperatures (Higher Ambient) Thyroid Activity at (Sukhen Chaudhuri and D P Sadhu), 560
Temperatures (Low) Investigation with the Electron Microscope of the Sublimation of Ice Crystals at (Prof Tokio Nei), 1177
  Purification of Hydrogen Isotopes by Self-Displacement Chromatography at (Dr T R Phillips, D R Owens and A G Hamlin), 1067
Temperatures (Sub-lingual), of Heat-acclimatized People Heart-rates and the (Dr G C Whittow), 1086
Temperatures (Total), to 10,000°K Mach Tables for Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with (K L Goin), 308
Tendons undergoing Contraction–Relaxation Extendability of (Dr H R Elden and G Webb), 742
Tennant, Smithson (1761-1815), (Dr A E Wales), 1224
Tenorova, M , and others Agarophoresis and Immuno-electrophoresis of the Proteins of Gastric Juice, 763
Tentori, L , and others Effects of Iodoacetic Acid on the Incorporation of Phosphorus-32 into the Deoxyribonucleic Acid of some Radiosensitive Organs in Rats exposed to X-Rays, 573
Terent'ev, N M (Faddeyeva, V N , and) Table of Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$$

for Complex Argument (edited by V A Fok), translated from the Russian by D G Fry, *review* by Prof C A Coulson, 97
Terminal Oxidase of *Iris pseudacorus* L Cytochrome *c* Oxidase, the (G G Henshaw, D A Coult and D Boulter), 579
Termites (Oriental) Contributions to the Systematics of (M L Roonwal and P K Sen-Sarma), *review* by W V Harris, 851
Ternary *R*-Phases (New), with Silicon (D I Bardos, K P Gupta and Prof Paul A Beck), 744
Terrestrial Physics (Atmospheric and), Journal of Special Supplement No 7, Vistas in Astronomy (edited by Arthur Beer), Vol 3, Part 1, Dynamics, Geophysics, Instruments, Solar System , Vol 3, Part 2, Stellar Astronomy, Stellar Evolution, Photometry, Galaxies, Spectroscopy, Cosmology, *review* by Dr A Danjon, 838
Tertiary Creep Stress Concentration Effects in (Dr P W Davies and B Wilshire), 1281
Tess, B R , and others Utilization of Sheep Red Blood Cells in the Haemadsorption Test for Myxoviruses, 582
Test (An Early), for Possible Skin Carcinogens (Olav Hilmar Iversen), 273
Test (Haemadsorption), for Myxoviruses Utilization of Sheep Red Blood Cells in the (H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Test (A 'Microspot'), for Antigens and Antibodies (Dr Joseph G Feinberg), 985
Test (A New), for Detecting Anaphylactic Sensitivity—the Basophil Reaction (Prof Walter B Shelley and Lennart Juhlin), (1056, September 9), *erratum*, 21
Test Facilities (Hypervelocity) Mach Tables for Real Gas Equilibrium Flow of Air in, with Total Temperatures to 10,000°K (K L Goin), 308
Test Rig Solid Propellant Rocket Motor (P A Hilton and Co), 608
Testicular Cells (Guinea Pig), grown *in vitro* Spermatocytogenesis with Possible Spermiogenesis of (Dr Russell T Jordan, Dr Seymour Katsh and Nadia de Stackelburg), 1053
Testicular Cells (Guinea Pig), grown in Cell Culture Antigenicity of, as determined by the Isolated Ileum Technique (Dr Seymour Katsh and Dr Russell T Jordan), 770
Testing of Nuclear Weapons Radioactive Fall-out and the—Statement by the Medical Research Council, 400
Testosterone A Carcinogenic Action of, provoking Uterine Tumours in Mice (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
  Œstrous-inducing Activity of, in the Ewe (D R Lindsay and Prof T J Robinson), 761
Tests for Liver Dysfunction in Dogs (Celia M Hoe), 1045
Tests (Russian Nuclear-Weapons), of September 1961 Radioactivity in Rainfall during September 1961 following the (Keith Boddy), 443
Tetrachloride (Carbon) Protection by Antioxidants against Lethal Doses of (Dr C H Gallagher), 881
Tetrahydropyranyl Derivatives of Glycine, Serine and Urea Some (S M. Amir, Dr M Z Atassi, Dr S A Barker, Dr J S Brimacombe and Dr M C Keith), 1069
Tetramer (A Cyclic), of Chloral (Maximo Baron), 258
Tetrazolium Compounds Use of, in Oxidative Enzyme Histo- and Cyto-Chemistry (Prof C G Rosa and Kwan-Chung Tsou), 990
Tett, H C Appointed a member of the Council for Scientific and Industrial Research, 113
Text-Book of Inorganic Chemical Analysis, *review* by Dr G Kakabadse, 836
Text-Books (Physics) A New Look in, *review* by G R Noakes, 99
Textile Institute Institute Medal awarded to K W L Kenchington, 406
  Service Medal awarded to P H S Bell and to J Boyd, 406
  Companionship awarded to C E Harrison and to F M Stevenson, 406
Thaine, Dr R Transcellular Strands and Particle Movement in Mature Sieve Tubes, 772
Thalamic Stimulation in the Course of Stereotaxic Procedures for Parkinsonism Arrest of Acceleration of Speech evoked by (Dr G Guiot, and collaborators), 921
Thalassaemia in Melanesia (B Ryan), 75
Theorell, Prof Hugo, and McKee, Dr J S McKinley Mechanism of Action of Liver Alcohol Dehydrogenase, 47 , *erratum*, 710
Theoretical Chemistry Summer School in (University of Oxford), 609
Theoretical Physics in the University of Sussex, 504
Theoretical and Experimental Physics (Dr H G Jerrard and Dr D B. McNeill), *review* by D H Trevena, 491
Theory Boundary Layer (Dr Hermann Schlichting), fourth edition, translated by Dr J Kestin, *review* by E J Watson, 842
  Maser, *review* by Dr J H Sanders, 202
  Probability (Prof Michel Loeve), second edition, *review* by D G Kendall, 7
Theory of Boundary Layers, *review* by E J Watson, 842
Theory of Crystal Structure Analysis (A I Kitaigorodskii), translated from the Russian by David and Katherine Harker, *review* by Dr M M Woolfson 904
Theory of Error and Design of Experiment A Chemist's Introduction to Statistics, (Dr D A Pantony), 213
Theory of Functions of a Complex Variable Lectures on the (Prof G. Sansone and Dr Johan Gerretsen), Vol 1, Holomorphic Functions, *review* by Prof W K Hayman, 694
Theory of Numbers An Introduction to the (Prof Ivan Niven and Prof. Herbert S Zuckerman), *review*, 856
Theory (Function), and its Applications, *review* by Prof W K Hayman, 694
Theory (Laminar Boundary-Layer) New Methods in (Dr D Meksyn), *review* by E J Watson, 842
Theory (Learning), and the Therapy of Neurosis (Ralph Metzner), 405
Theory (Maser) Elements of (Arthur A. Vuylsteke), *review* by Dr J H. Sanders, 202
Theory (Mathematical), of Nutritional Relationships of Fishes, *review* by L Birkett, 297
Theory (A Quantitative), of the Character of Chemical Bonding in Binary Compounds (Prof Edward Gorlich), 133
Theory and Design of Inductance Coils (Dr V G Welsby), second edition, *review* by Prof A H M Arnold, 845
Theory and Practice of Hydraulic Measurements Hydrometry— (Prof. Adam T Troskolanski), *review* by Prof S P Hutton, 842
Theory and Tables of the Blue Sky, *review* by Prof Zdenek Kopal, 1005
Therapy of Neurosis Learning Theory and the (Ralph Metzner), 405
Thermal Annealing Behaviour of Neutron-Irradiated Ammonium Sulphate on (Dr Nikola Getoff and Masaru Nishikawa), 61
Thermal Decomposition of Ammonium Perchlorate in presence of Zinc Oxide (Dr F Solymosi and L Revesz), 64
Thermal Emission (Polarized), from Narrow Tungsten Filaments (Prof. Yngve Ohman), 254
Thermal Reaction between Two Light Reactions in Photosynthesis (Prof. C P Whittingham and P M Bishop), 426
Thermal Shock Formation of Cracks in Ice Plates by (L W Gold), 130
Thermionic Conversion of Heat to Electricity (R V Harrowell), 611
Thermionic Generation of Electricity (Central Electricity Generating Board Symposium on), 611
Thermophilic Micro-organisms Factor converting Mesophilic into (Edward H Sie, Dr Harry Sobotka and Herman Baker), 86
Thermophilic Micro-organism of Uncertain Taxonomic Status from the Hot Springs of Tiberias (Israel), (David Kahan), 1212
Thermoreceptors The Electro-physiology of (Prof Herbert Hensel), 309
Thermo-stimulated Current Curves Dependence of, on Heating Rate (C G Clayton, J B Whittaker, G A Briggs and T G Kelly), 349
Thickness (Boundary Layer), in Electrolytic Systems Evaluation of, from Decay of Anode Concentration Polarization (Leonard Nanis), 449
Thickness (Mass), of Biological Samples Estimation of, from their Electron Micrographs (M L De), 546
Thinking (New), in School Chemistry (Organization for European Economic Co-operation), 404
Thio-Thiophthene Crystal Structure of 2,5-Dimethyl-Dithio-Furophthene, a Homologue of (Dr M Mammi, R Bardi, G Traverso and S Bezzi), 1282
Thiocysteamine Detection and Distribution of Enzymes for oxidizing (D Cavallini, C De Marco and B Mondovi), 557
Thiolated Gelatin Modification of the Properties of Flour Protein by (E E McDermott and J Pace), 657
Third Molar Polymorphism and the Timing of Tooth Formation (Stanley M. Garn, Arthur B Lewis and Batsheva Bonné), 989
Thirty Years Ago Rocket Propulsion (Paul Adorian), reprint, 308

Thompson, N B W Appointed lecturer in physical metallurgy at the University of Birmingham, 406
Thomson, Sir George The Inspiration of Science (First Thomson Lecture of the Society of Instrument Technology), 696
Thomson, Dr W A R Chemistry in the Service of Medicine (Progress from Antisepsis to Antibiotics), 1019
Thomson Lecture of the Society of Instrument Technology First (Sir George Thomson), 696
Thorp, J A Thermionic Generation of Electricity (Auxiliary Ion Sources in Caesium Diodes), 612
Thorsen, A C, and Berlincourt, T G de Haas–van Alphen Effect in InBi, 959
Thousand-headed Kale (Marrow Stem and) Potential Productivity of (Dr L G G Warne), 579
Three Racial Groups Quantitative Sub-Groups of the *B* Antigen in Man and their Occurrence in (Mary B Gibbs, Colonel Joseph H Akeroyd and Julia J Zapf), 1196
Three-spined Stickleback (Nine-spined and the) Serological Relationships between the (Tadeusz Penczak), 673
Thring, Prof M W Conventional Methods of Converting Heat into Electricity (Producing Electricity directly from Fast-moving Plasmas), 702
Thrombocytes (Human Leucocytes and) Specific Antigens of (Nechama Gilboa-Garber and Dr A Nelken), 466
Thrombocytosis evoked by Exercise (H S S Sarajas, A Konttinen and M H Frick), 721
Thromboplastic Activity of Red Cells (Prof Armand J Quick), 882, (Dr James A Inglis and Dr June W Halliday), 882
Thrust Mechanics Application of Palaeomagnetism to (D K Norris and R F Black), 933
Thymectomy Effects of, on the Resistance of Rats to Drowning and Histamine Stress (Dr A S Weltman and A M Sackler), 460
Thymidine (Tritiated) Induction of Tumours in Mice with (Hermann Lisco, Renato Baserga and Walter E Kisieleski), 571
  Uptake and Culture of, in *in vitro* Culture (Dr W M Rigal), 768
Thymus Role of the, in Polysaccharide Metabolism (G Csaba, G Toth, Prof I Toro, Th Ács and L Csaki), 1304
Thymus of the Foetal Rabbit Hormonal Control of the Development of the (J G Bearn), 875
Thymus Nucleoprotein in Solution Effect of Gamma-Rays on (Dr A R Peacocke and Dr B N Preston), 228
Thyroglobulin Proteolysis of, by Thyroid Enzymes (Dr Mary T McQuillan, J D Mathews and Prof V M Trikojus), 333
Thyroid Activity at Higher Ambient Temperatures (Sukhen Chaudhuri and D P Sadhu), 560
Thyroid Enzymes Proteolysis of Thyroglobulin by (Dr Mary T McQuillan, J D Mathews and Prof V M Trokojus), 333
Thyroid Gland (Pig) Demonstration and some Properties of Peroxidase in (Toichiro Hosoya and Nobuo Ui), 659
Thyrotropic and Adrenotropic Mouse Pituitary Tumours Difference in Metabolism of Labelled Thyroxine between (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Thyroxine (Labelled) Difference in Metabolism of, between Thyrotropic and Adrenotropic Mouse Pituitary Tumours (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Thyroxine-^{131}I in Tumour-bearing Rats Deiodination of (J A Stein, M Anbar, S Guttmann and N Ernst), 1303
Tiberias (Israel) Thermophilic Micro-organism of Uncertain Taxonomic Status from the Hot Springs of (David Kahan), 1212
Tibiotarsi (Embryonic Chick), cultivated *in vitro* Effect of L-Glutamic Acid on the Weight of (Dr J D Biggers), 664
Tick-borne Encephalitis Virus in HeLa Cells Reproduction of (Dr H Libikova and Dr P Albrecht), 779
Ticks Intracellular *Rickettsia*-like Micro-organisms in certain (M A Roshdy), 186
Tille, J (Johnson, Dr Edward A, and) Evidence for Independence of Voltage of the Membrane Conductance of Rabbit Ventricular Fibres, 663
Tilley, B J Awarded a B B C Research Scholarship, 115
Tillman, J R The International Dictionary of Physics and Electronics, *review*, 1111
Timbers (Indian) Identification, Properties and Uses of, *review* by Dr C R Metcalfe, 1110
Time Signal (International) Changes in Times of (Royal Greenwich Observatory), 1023
Time-Resolved Spectroscopy (Prof J D Craggs), 1032
Time-Resolved Techniques Spectroscopic Studies using (Institute of Physics and the Physical Society Conference on), 1032
Times of International Time Signal Changes in (Royal Greenwich Observatory), 1023
Timing of Tooth Formation Third Molar Polymorphism and the (Stanley M Garn, Arthur B Lewis and Batsheva Bonne), 989
Timms, A B At the Third Australian Spectroscopy Conference (Spectrographic Determination of Hafnium/Zirconium Ratios), 928
Timourian, H, and others Precipitating Antibodies in the Carpet Snake against Parasitic Nematodes, 996
Tine, Prof G Gas Sampling and Chemical Analysis in Combustion Processes, *review* by Dr C F Cullis, 1108
Tinlot, J H, and others (edited by) Proceedings of the 1960 Annual International Conference on High Energy Physics at Rochester, *review* by Dr G H Stafford, 7
Tinson, Christine, and others Modification of the Effects of an Amphetamine–Barbiturate Mixture by the Past Experience of Rats, 533
Tip (The Growing), of Plants, *review* by Dr A Allsopp, 830
Tipton, Jr, C R (edited by) Reactor Handbook, Vol I, Materials, second edition, *review* by B W Mott, 100
Tissue (Arterial), of the Rabbit Transaminase Activity in (Dhurjati Prasad Chattopadhyay), 660
Tissue (Connective), and Intestine Alterations in, produced by Hypervitaminosis A in *Xenopus laevis* (Gerald Weissmann), 235
Tissue (Gill), of Lingcod (*Ophiodon elongatus*) Penetration of Spines from a Marine Diatom into the (Dr Gordon R Bell), 279
Tissue (Human) A New Method for Local Chemical Analysis of (Robert C Mellors and Kenneth G Carroll), 1090
  Producing Transplantable, in the Laboratory (Dr D Petrucci), 21
Tissue (Neoplastic) (Oncolipin) Interaction between Lysozyme and a Phospholipid of (R Ferrari and S Matracia), 1187
Tissue (Nervous) Cytology of (Papers on, at the Annual General Meeting of the Anatomical Society of Great Britain and Ireland), 406
Tissue (Wound) Regeneration Changes in the Concentration of Ribonucleic Acid during (Martin B Williamson and Wilhelm Guschlbauer), 454
Tissue Culture of Human Bone Marrow treated with Human Deoxyribonucleic Acid Formation of Different Haemoglobins in (Prof Lorraine M Kraus), 1055
Tissue Cultures (Human) Growth of Contagious Pustular Dermatitis Virus in (Prof A Macdonald and T M Bell), 91
Tissue Eosinophils and Peroxidase Activity Relationship between (Tapio Rytomaa and Prof Harald Teir), 271
Tissues Exchange of Substances between the Blood and (Sir Howard Florey), 908
  Limitations of the Periodic Acid–Schiff Technique for the Demonstration of Stages of *Eimeria* in (P L Long, D G Rootes and Dr C Horton-Smith), 1315
Tissues of Higher and Lower Plants and their related Uronic Acid Contents Cation-Exchange Capacities of (A H Knight, W M Crooke and R H E Inkson), 142
Tissues (Chicken) Persistence of Sterols other than Cholesterol in (David Kritchevsky and Vittorio Defendi), 71
Tissues (Fresh and Cultured) Chromosome Preparation from, using a Modification of the Drying Technique (M Fox and Dr I M Zeiss), 1213
Tissues (Insect) Retinene-I in (Michael H Briggs), 874
Tissues (Neoplastic) Binding of *RP2-L*—a Nuclear Protein of—to Deoxyribonucleic Acid (Paul Byvoet and Prof Harris Busch), 870
Titanium Getters (Impure) Evolution of Hydrocarbons from (L Holland, L Laurenson and P G W Allen), 749
Titanium Oxide Bronzes Alkali Metal (A D Wadsley and Sten Andersson), 551
Tobacco—Experimental and Clinical Studies, a Comprehensive Account of the World Literature (Prof P S Larson, Prof H B Haag and Prof H Silvette), *review* by Kenneth Bloor, 848
Tobacco Indian (Indian Central Tobacco Committee), *review*, 1007
Tobacco Mosaic Virus Movement of, through Epidermis of *Nicotiana glutinosa* Leaves (Dr D G Kontaxis), 581
  Photo-Reactivation of, *in vivo* (D J Goodchild), 289
Tobago (Trinidad and) Birds of (Dr G A C Herklots), *review* by Dr L B Quesnel, 828
  Native Orchids of (Dr Richard Evans Schultes), *review* by P Francis Hunt, 831
Todd, Sir Alexander Chemistry in the Service of Medicine (Long-standing Relationship between Chemistry and Medicine), 1019
Tolerance Cellular Dose and Age of Host in the Induction of (Dr L Brent and Dr G Gowland), 1265
Tolerance of Tsetse Flies to Insecticides Effect of Age and Pregnancy on the (G F Burnett), 188
Tolerance (Acquired), to Homografts produced by Homologous Spleen Cell Injection in Adult Mice (Ronald D Guttmann and J Bradley Aust), 564
Tolles, W E, and Mansberg, H P Scanning Techniques in Biological and Medical Microscopy (The 'Cytoanalyser' for the Mass Screening of Cervical and Vaginal Smears, to aid in the Early Diagnosis of Cancer), 1031
Tollmien, Walter, und andere (herausgegeben von) Ludwig Prandtl Gesammelte Abhandlungen zur Angewandten Mechanik, Hydro- und Aerodynamik (schriftlietung F W Riegels), Teile 1-3, *review* by M James Lighthill, 841
Tomato Mosaic Virus Infection Influence of, on the Hollow Fruit Condition of Tomatoes (D J Harrison), 90
Tomato Roots Effect of Water Movement on Salt Movement through (William Lopushinsky and Paul J Kramer), 994
Tomatoes Influence of Tomato Mosaic Virus Infection on the Hollow Fruit Condition of (D J Harrison), 90
Tomita, K (Bryan R F, and) Crystal Structures of Salts of Methylated Purines and Pyrimidines, 812
Tomkeieff, Prof S I Some Aspects of Asiatic Russia, *review*, 200
Tongue-Worms of African Vertebrates The Mites and, *review* by Dr F A Turk, 1222
Tooth Formation Third Molar Polymorphism and the Timing of (Stanley M Garn, Arthur B Lewis and Batsheva Bonne), 989
Toothcarp *Xiphophorus helleri* (Viviparous) Role of Cell Division in Gastrulation of the (Prof A Stolk), 374
Torii, Dr Toshio, and Kohoriuchi, Dr Yoshihi Antigenicity of Penicillin and its relation to Albumin Binding, 429
Tōro, Prof I, and others Role of the Thymus in Polysaccharide Metabolism, 1304
Tortonese, Dr Enrico Mediterranean Fishes of the Family Istiophoridae, 80
Total-Body X-Irradiation Enhanced Effect of, in Mice under Mild Hypothermia (Dr H J G Bloom and K B Dawson), 232
Total Potential of the Soil Water Importance of Osmotic Potential as a Component of the, on the Movement of Nematodes (C D Blake), 144
Total Temperatures to 10,000° K Mach Tables for Real Gas Equilibrium Flow of Air in Hypervelocity Test Facilities with (K L Goin), 308
Toth, G, and others Role of the Thymus in Polysaccharide Metabolism, 1304

Tottle, Prof C R *Obituary* of Dr T P Colclough, 706
Towers, A G Acid Extract of Leucocytes and *Staphylococcus pyogenes*, 272
Townes, Dr C H Presented with the David Sarnoff Award in Electronics of the American Institute of Electrical Engineers, 606 , work of, 606
Townes Dr C H (Abella, Dr I D , and) Mode Characteristics and Coherence in Optical Ruby Masers 957
Townes, Dr C H , and Schwartz, Dr Robert N Interstellar and Interplanetary Communication by Optical Masers, 348
Toxic Chemicals in Agriculture and Food Storage, 1130
Toxic Principle of *Dichapetalum toxicarium* (18-Fluoro-*cis*-9-Octadecenoic Acid) Synthesis of the (Prof F L M Pattison and R E A Dear), 1284
Toxicity of 5-Fluorouracil and 5-Fluorodeoxyuridine Reversal of, for *Candida albicans* by Pyridoxine and Pyridoxamine (Dr M L Littman and Dr T Miwatani) 1155
Toxicity associated with certain Samples of Groundnuts (Dr M C Lancaster, F P Jenkins and J McL Philp), 1095 , (Dr K Sargeant, Ann Sheridan, J O'Kelly and R A Carnaghan) 1096
Toxicity (Cation), and the Stability of Transition-Metal Complexes (Dr William H R Shaw) 754
Toxicity (Second-Generation), of Malathion in Rats (Prof W Kalow and A Marton), 464
Toxin (Anti-) A Subcellular Component of *Corynbacterium diphtheriae* having the Capacity to Bind (Prof M Yoneda and M Matsuda), 642
Toxoid (*Corynebacterium pyogenes*), with High Anti-Haemolysin Titre in Rabbits New Method of preparing (Valerie Levy), 189
Toyoura, Etsuko, and others Acylase Activity of Ascites Tumour Cells on Dichloroacetyl Derivatives of Amino-Acids, 468
Tracer (Radioxenon) Loss of Fluorescent Particles in Atmospheric Diffusion Experiments by Comparison with (A E J Eggleton and N Thompson), 935
Tradescantia Anthers cultured in Media Deficient in Sugar Kinetin-induced Meiotic-Prophase Acceleration and Stasis in (Prof G W R Walker and J Dietrich), 889
Training in France Education and (British Association for Commercial and Industrial Education Report on), 920
Training of Industrial Food Scientists and Technologists in the United Kingdom (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 302
Training (Education and), on the Continent of Europe (British Association for Commercial and Industrial Education Conference on), 718
Traité de Zoologie (publié sous la direction de Pierre-P Grassé), Tome 5, Fasc 1, Annélides, Myzostomides, Sipunculiens, Echiuriens, Priapuliens, Endoproctes, Phoronidiens , Tome 5, Fasc 2, Bryozoaires, Brachiopodes, Chetognathes, Pogonophores, Mollusques (Géneralites, Aplacophores, Polyplacophores, Monoplacophores, Bivalves), *review* by Prof C H O'Donoghue, 590
Trans-Caffeic Acid isolated from *Coleus rhenaltianus* Growth-stimulating Activity of (Dr J C Vendrig and K Buffel), 276
Transaminase Activity in Arterial Tissue of the Rabbit (Dhurjati Prasad Chattopadhyay), 660
Transamination and the Control of Mitochondrial Pathways (Dr H Gutfreund, Dr K E Ebner and L Mendio'a), 820
Transatlantic Radio Diamond Jubilee of, 919
Transcellular Strands and Particle Movement in Mature Sieve Tubes (Dr R Thaine), 772
Transduction versus Transformation of Linked Markers in *Bacillus subtilis* Comparison of (Erela Ephrati-Elizur and Maurice S Fox), 433
Transfer of Immediate (Anaphylactic) Hypersensitivity by Homologous Bone Marrow or Spleen Cells (Dr V Stanković and S Vlahović), 762
Transfer of Stratospheric Fission Products into the Troposphere (D H Peirson), 497
Transfer (Linear Energy) Radiolysis of Liquid Acetone—Effect of Dose-rate and (R Barker), 62
Transferase (Nicotinamide Mononucleotide–Adenylyl), of Liver Nuclei Substrate Specificity and Inhibition of—Possible Mechanism of Effect of 6-Mercaptopurine on Tumour Growth (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Transferrin in the Foetus Genetical Evidence for Synthesis of (Dr A R Rausen, Dr P S Gerald and Dr L K Diamond), 182
Transferrin Differences in Chimpanzee Sera (Prof John Buettner-Janusch), 632
Transferrin Types (Haptoglobin and), in Peruvian Indians (Dr Eloise R Giblett and Dr William R Best), 1300
Transferrins Multiple Haemoglobins and, in a Macaque Sibship (Prof J Buettner-Janusch, J B Twichell, Bert Yuan-Shu Wong and Gertrude Van Wagenen), 948
Transformation of Linked Markers in *Bacillus subtilis* Comparison of Transduction versus (Erela Ephrati-Elizur and Maurice S Fox) 433
Transformation (A New Reversible Solid-State), in Iron–Nickel Alloys in the Invar Range of Compositions (Prof N I Ananthanarayanan and R J Peavley), 962
Transient Magnetic Fields A New Application of the Faraday Magneto-Optical Effect for Diagnostic Measurements of (R D Medford, W H W Fletcher, J D Herbert and A L T Powell), 622
Transition in the Dielectric Properties of Solid Secondary Alcohols (J S Dryden and H K Welsh), 255
Transition-Metal Complexes Cation Toxicity and the Stability of (Dr William H R Shaw), 754
Transitions (Auto-Ionizing), in Krypton Experimental Detection of, by Electron Impact (John F Burns), 651
Translation (Computer), of Chemical Nomenclature Chemico-Linguistics— (A Garfield), 192
Transliteration Cyrillic, 405
Translocated Heat Injury in Plants (Prof C E Yarwood), 887
Transmission of Clover Phyllody Virus by *Aphrodes bicinctus* (Schrank) in North America (Dr L N Chiykowski), 581
Transmission of Lapinized Rinderpest Virus by Contact between Rabbits (Dr G R Scott and C S Rampton), 289
Transmission of Mouse Leukaemia with Purified Nucleic Acid Preparations (Dr Esther F Hays) 230
Transmission Lines (Non-Linear), for Millimetre Wave Generation and Reception (Dr D Walsh), 1064
Transmission Mechanisms (Cholinergic), for both Excitation and Inhibition in Molluscan Central Synapses (Dr L Tauc and Dr H M Gerschenfeld), 366
Transpeptidase-like Activity (γ-Glutamyl) Histochemical Demonstration of (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 338
Transplantable Human Tissue Producing, in the Laboratory (Dr D Petrucci), 21
Transplantation and Chronic Obstruction of the Rabbit Appendix Morphological Changes following (J A Williams, W O Griffen, jun , and A Sharma), 877
Transport of Amino-Acids in Brain Phenylalanine as Inhibitor of (K D Neame), 173
Transport System (New Renal Tubular Amino-Acid), and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
Transport and Metabolism (Sulphate), by *Desulphovibrio desulphuricans* (Prof C Furusaka), 427
Trapani, I L , and others Identification of Antibody in β_2-Globulins of Mouse Serum and Ascitic Fluid, 885
Trauma (Local), in Young Rats Generalized Skeletal Response on, studied by means of ^{45}Ca-Metabolism (Dr Jaromír Kolař and Dr Arnošt Babicky), 1297
Travel Grants Fulbright, 406
Travers, Prof M W *Obituary* by Prof D H Everett, 1127
Traverso, G , and others Crystal Structure of 2,5-Dimethyl-Dithio-Furophthene, a Homologue of Thio-Thiophthene, 1282
Trawl Fishing in the Tropical Atlantic—Catch-rates and Composition (R H Lowe (McConnell) and Alan R Longhurst, 620 , Preliminary Bionomic Data from West African Fisheries (Alan R Longhurst), 621
Treasury Grant, Academic Year 1959-1960 Return from Universities and Colleges in receipt of (University Grants Committee), 617, 786
Treatment (Medical) Recent Developments in (*Practitioner*, Vol 187, No 1120), 506
Treatment (Re-Educative), of Suppression Amblyopia (Being an abridged English version of Jean Sédan's ‘Post Cure de l'Amblyope Rééduque'), (T Keith Lyle, Cynthia Douthwaite and Jill Wilkinson), *review* by Prof O L Zangwill, 695
Treaty Organization (Central), Scientific Council of the Symposium on the Role of Science in the Development of Natural Resources with particular reference to Iran, Pakistan and Turkey, 609
Tree (Cork) Cork and the (Dr Giles B Cooke), *review* by F N Howes, 852
Tree (Fruit) Red Spider Evaluation of the Activity of some Diphenyl Compounds on Winter Eggs of the (J Meltzer), 474
Trees of Consequence, *review* by T A Russell, 488
Trees (Ornamental), for Garden and Roadside Planting (S A Pearce), *review* by F P Knight, 852
Tregellas-Williams, Dr J At the Third Australian Spectroscopy Conference (Methods for increasing the Discrimination between Similar Infra-red Spectra), 927
Trehalose in the Cellular Slime Mould *Dictyostelium mucoroides* (James S Clegg and Michael F Filosa), 1077
Treisman, Dr M At the Sixth Annual Conference of the British Society for the Philosophy of Science (Explanation in Psychology), 508
Trends (Current), in Scientific Research (Prof Pierre Auger), *review* by R Brightman, 850
Trenkle, Allen, and others Complement-fixing Antibodies to Human Growth Hormone and Sheep Interstitial Cell Stimulating Hormone, 260
Trevena, D H Theoretical and Experimental Physics, *review*, 491
Trichothecin and Crotocin Enzymic Inactivation of (Dr I Horvath and J M Varga), 88
Trigonal-Bipyramidal Configuration of the Iodo *Bis*(2-2′-Bipyridyl) Copper (II) Ion (Properties of some Copper Complexes), (Dr G A Barclay and C H L Kennard), 425
Trikojus, Prof V M , and others Proteolysis of Thyroglobulin by Thyroid Enzymes, 333
Trinidad and Tobago Birds of (Dr G A C Herklots), *review* by Dr L. B Quesnel, 828
  Native Orchids of (Dr Richard Evans Schultes), *review* by P Francis Hunt, 831
Trinity College, Dublin Appointment of Dr R G S Hudson to the chair of geology and mineralogy, 1022
Triops Chloride Regulation in (Gwyneth Parry), 468
Triphosphatase (Actomyosin Adenosine), from Fresh, Frozen and Freeze-dried Beef Comparative Effects of 2,4-Dinitrophenol on the (L J N Cole), 1288
Triple Resonance Phenomenon in Plasmas (T J Bellanca, Prof R S Elliott and J J Erlinger), 543
Tristan da Cunha (Special Exhibition at the Geological Museum, London), 403
  Royal Society Expedition to, 1129
Tritiated Noradrenaline Fate of, at the Sympathetic Nerve-Endings (G Hertting and J Axelrod), 172
Tritiated Thymidine Induction of Tumours in Mice with (Hermann Lisco, Renato Baserga and Walter E Kisieleski), 571
  Uptake and Incorporation of, in *in vitro* Culture (Dr W M Rigal), 768
Tritium Content (High), of Atmospheric Methane, Hydrogen and Stratospheric Water Origin of (Dr Richard Wolfgang), 1279
Trivalent Cations in Crystalline Potassium Chloride Incorporation of (Dr Marian E Hills and Prof Allen B Scott), 1066
Trollope, Dr D H Effective Contact Stresses and Friction (July 22, 376), *errata*, 213
Tropical Anaemias Grants for Research on (Wellcome Trust), 211
Tropical Atlantic Trawl Fishing in the—Catch-rates and Composition (R H Lowe (McConnell) and Alan R Longhurst), 620 , Preliminary Bionomic Data from West African Fisheries (Alan R Longhurst), 621
Tropical Paradise Birds of, *review* by Dr L B Quesnel, 828
Tropical Plants Research with, 418
Tropical Products Institute Open Days (B R Smith), 923
Tropical Products Institute Committee Report of the, with the Report of the Tropical Products Institute (Department of Scientific and Industrial Research), 418
Troposphere Transfer of Stratospheric Fission Products into the (D H Peirson), 497
Troskolanski, Prof Adam T Hydrometry—Theory and Practice of Hydraulic Measurements, *review* by Prof S P Hutton, 842

Trout Action of a Detergent (Dodecylbenzenesulphonate) on the Gills of the (O J Schmid and H Mann), 675
Trypanocidal Drug (A New Prophylactic), 2,7-di-(*m*-amidinophenyldiazoamino)-10-ethyl-9-phenyl-phenanthridinium Chloride Dihydrochloride (*M & B* 4596), (S S Berg, K N Brown, J Hill and W R Wragg), 367
Trypsin Peptides, Terminal and Internal, released by Digestion with (Amino-Acid Sequence of Horse Heart Cytochrome c), (Dr G Kreil and Prof H Tuppy), 1123
Trypsin Inhibitor in Wholewheat Flour (G Shyamala, Barbara M Kennedy and Prof R L Lyman), 360
Trypsin Inhibitors in the Sera of various Animals Distribution of (S Nakamura and T Wakeyama), 1077
Tryptophan Interaction of ^{14}C-Œstrone with, in the Presence of Peroxidase (Dr P H Jellinck and Louise Irwin), 660
Tsetse Flies Effect of Age and Pregnancy on the Tolerance of, to Insecticides (G F Burnett), 188
Tsou, Kwan-Chung (Rosa, Prof C G, and) Use of Tetrazolium Compounds in Oxidative Enzyme Histo- and Cyto- Chemistry, 990
Tsujino, Isami, and Saito, Tsuneyuki A New Unsaturated Uronide isolated from Alginase Hydrolysate, 970
Tube Vortex Shedding from the End of a, as a Result of Buoyancy Effects (A A Putnam), 1277
Tube Investments Research Laboratory Appointment of Dr J W Menter as director, 21
Tuberculostatic 1,3,4-Oxadiazolones (New) Biological Spectrum of some, with special reference to Cross-Resistance and Rates of Emergence of Resistance (Prof A E Wilder Smith and Hans Brodhage), 1195
Tubes (Sieve) Transcellular Strands and Particle Movement in Mature (Dr R Thaine), 772
Tubular Amino-Acid Transport System (New Renal), and a New Hereditary Disorder of Amino-Acid Metabolism (Dr C R Scriver, I A Schafer and M L Efron), 672
Tubules (Renal Collecting) Antidiuretic Hormone and (Paul Breddy, Grahame F Cooper and Dr Jeffrey M N Boss), 76
Tucker, Dr S Horwood An Electronic Outline of Organic Chemistry, *review* by Dr Neville H P Smith, 7
Tuft, Peter Role of Water-regulating Mechanisms in Amphibian Morphogenesis—a Quantitative Hypothesis, 1049
Tumour Cells (Ascites) Acylase Activity of, on Dichloroacetyl Derivatives of Amino-Acids (Yukio Kameda, Katsuhiko Matsui, Yukio Kimura and Etsuko Toyoura), 468
  Intracellular Response to an Iso-immune Reaction at the Surface o (D C Dumonde, Clarice G Walter, Lucille Bitensky, Prof G J Cunningham and J Chayen), 1302
Tumour Growth Substrate Specificity and Inhibition of Nicotinamide Mononucleotide–Adenylyl Transferase of Liver Nuclei—Possible Mechanism of Effect of 6-Mercaptopurine on (Dr M R Atkinson, J F Jackson and Prof R K Morton), 946
Tumour Strain Cells (Normal and) Action of Radiation on Synthesis of Deoxyribonucleic Acid in (Dr John Seed), 944, *erratum*, 1241
Tumour-bearing Rats Deiodination of Thyroxine-^{131}I in (J A Stein, M Anbar, S Guttmann and N Ernst), 1303
Tumours in Mice Induction of, with Tritiated Thymidine (Hermann Lisco, Renato Baserga and Walter E Kisieleski), 571
Tumours (Ascites) Types of Cell in (Dr John O Laws), 78
Tumours (Carcinogen-induced), in Mice Chromosomal Lesion associated with (June Lee Biedler, Lloyd J Old and Dr Donald A Clarke), 286
Tumours (Malignant) Apparent Induction of, by Organ-Specific Antiserum (Prof H N Green), 1201
Tumours (Mouse Pituitary) Difference in Metabolism of Labelled Thyroxine between Thyrotropic and Adrenotropic (Dr Sidney C Werner, Eugene M Volpert and Raul Grinberg), 1193
Tumours (Uterine), in Mice A Carcinogenic Action of Testosterone, provoking (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
Tungsten Filaments (Narrow) Polarized Thermal Emission from (Prof Yngve Öhman), 254
Tuplin, Prof W A The Mechanics of Vibration, *review*, 844
Tuppy, Prof H (Kreil, Dr G, and) Amino-Acid Sequence of Horse Heart Cytochrome c—Peptides, Terminal and Internal, released by Digestion with Trypsin, 1123
Tuppy, Prof H, and others Amino-Acid Sequence of Horse Heart Cytochrome *c*—The Complete Amino-Acid Sequence, 1125
Turcan, J R Appointed to a Research Fellowship in engineering production in the University of Birmingham, 406
Turk, Dr F A The Mites and Tongue-Worms of African Vertebrates, *review*, 1222
Turkey (Iran, Pakistan and) Role of Science in the Development of Natural Resources with particular reference to (Scientific Council of the Central Treaty Organization Symposium on), 609
Turley, H G At the Seventh Biennial Conference of the International Union of Leather Chemists Societies (American and European Practice in Chrome Tanning), 613
Turn-over (Mast Cell), in Adult Mice (Prof Bruce E Walker), 980
Turnbull R M Awarded a Fellowship in physics in the University of Glasgow, 1133
Turner, Alan B Awarded the Parsons Scholarship in Marine Engineering (1961) by the Royal Institution of Naval Architects, 309
Turner, C R Astronautics (Communication Satellites), 312
Turner, L W *Obituary* of H V Griffiths, 504

Tutin, John The Grayling Fish and River-Names, 1102
Twenty-five Years of Television, 606
Twenty-five Years of B B C Television (Sir Harold Bishop), 1240
Twichell Joseph B (Buettner-Janusch, Prof John, and) Alkali-resistant Haemoglobins in Prosimian Primates, 669
Twichell, Joseph B, and others Multiple Haemoglobins and Transferrins in a Macaque Sibship, 948
Twigg, G H Oxidation Processes in Chemical Manufacture (Liquid-phase Oxidation by Molecular Oxygen), 1135
Two Iron-Transport Proteins in Serum Presence of (Dr M Faber and R. Jordal), 181
Two-Level Maser Oscillator Detection of Spin Magnetization Variation in a (I M Firth and Dr D Bijl), 860
Two Light Reactions in Photosynthesis Thermal Reaction between (Prof. C P Whittingham and P M Bishop), 426
Two New Long-acting Sulphonamides 4-Sulphanilamido-6-Methoxy and 6-Ethoxy Pyrimidine (I C I Nos 32,525 and 33,536)— (Dr R Clarkson and Dr A R Martin, 523
Two Ox Muscles Comparative *in vitro* Activities of Phosphorylase *b* and Cytochrome Oxidase in Preparations from (E J Briskey and R A Lawrie), 263
Two-Sphere Non-directional Radiometers A Method of Calibrating (Dr. Walter Koch), 960
Two Types of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Tydeman, H M Rootstock Influence on the Flowering of Seedling Apples, 83
Tyler, jun, Prof Varro E, and others Occurrence of Sedoheptulose in Carpophores and Basidiospores of *Inocybe* Species, 1080
Tynan, A E, and others Recrystallization of Lead and Zinc Sulphides, 516
Type (New), of Blocking Agent against 5-Hydroxytryptamine 5-Hydroxy-3-indoleacetamidine—a (Dr Laszlo Gyermek) 465
Type (A Novel) of Antioxidant related to Polyporic Acid (Dr G J Bennett and Dr N Uri), 354
Types of Cell in Ascites Tumours (Dr John O Laws), 78
Types (Haptoglobin and Transferrin), in Peruvian Indians (Dr Eloise R Giblett and Dr William R Best), 1300
Types (Two), of Ribonucleoprotein in the Nucleolus of Intestinal Carcinoma of the Newt following Injection of Herring-Sperm Deoxyribonucleic Acid (Prof A Stolk), 1215
Tyrrell, H J V Diffusion and Heat Flow in Liquids, *review* by Prof A. R Ubbelohde, 845

UBBELOHDE, Prof A R Ionic Melts, 509
  Diffusion and Heat Flow in Liquids, *review*, 845
Udvardy, A, and others Effect of Monovalent Cations on the Blood Pressure of Intact and Hypertensive Rats, 362
Uganda The Mineral Resources of (compiled and edited by Dr J W Barnes), 921
Uganda (Western) Carbonatitic Lava from Fort Portal Area in (Dr O von Knorring and Dr C G B du Bois), 1064
Uhara, Ituro, and others Dislocations as Active Centres in Heterogeneous Catalysis, 867
Ui, Nobuo (Hosoya, Toichiro, and) Demonstration and some Properties of Peroxidase in Pig Thyroid Gland, 659
Ukil, Dr A C History of Sciences in Ancient and Medieval India, 27
Ultrabasic Liquids (Dr H I Drever, R Johnston and C M Thomas), 157
Ultrasonic Diffraction Orders Distribution of Intensity among various (Dr C Raghupathi Rao), 220
Ultrastructural Alterations during the Crabtree Effect in Rous Sarcoma Cells (Prof Alvin S Levine, Ruth Petraitis and James Green), 1271
Ultrastructure of Protein Fibers—Collagen, Muscle and Keratin (Electron Microscopy Society of America Symposium on), 610
Ultra-Violet Chromatography and Nucleotide Sequences of Deoxyribonucleic Acid synthesized in *Salmonella typhimurium* after Irradiation with (T Hudnik-Plevnik and Dr L A Stocken), 554
Ultra-Violet Absorption of Sea Water (F A J Armstrong and G T Boalch), 858
Ultra-Violet Fluorescence of several Globular Proteins Influence of *p*H and Urea on the (Dr R F Steiner and H Edelhoch), 873
Ultra-Violet Irradiation Detecting Reversion in *T4rII* Bacteriophage to r^+ induced by (Prof C E Folsome and D Levin), 1306
Ultra-Violet Radiation and Desiccation Effect of, on Different Age-Cultures of *Escherichia coli* K12 (I L Mulay and G S Sperti), 773
Ultra-Violet Television Microscopy (Television Microscopy), (Dr R Barer and J Wardley), 1060
Ultra-Violet and Visible Radiation Emission of, from Metals by the Impact of High-Energy Hydrogen Ions (Prof Rafi Mohammed Chaudhuri and Mustafa Yar Khan), 646
Uncertain Taxonomic Status Thermophilic Micro-organism of, from the Hot Springs of Tiberias (Israel), (David Kahan), 1212
Unconventional Methods of Energy Conversion (Prof D A Wright), 701
Uncrystallized Urinary Calculi composed of Glycolipo-Protein Excretion of, by Normal and Muscular Dystrophic Mice (C McGaughey), 1267
Unesco Arid Zone Research No 17, A History of Land Use in Arid Regions (edited by Prof L Dudley Stamp), 1236
Unesco, and others International Seminar for Research and Education in Physics, 709
Unesco and the World Meteorological Organization Symposium on Changes of Climate, 1139
Unesterified Fatty Acids Improved Gas Chromatography of (P Jowett and B J Horrocks), 966
Uniform (Non-) Fields in Dielectrics Rectifying Action of (Dr K C Kao), 650
Uninfected Serum-free Cell Cultures Cytopathic Protective Factor—its Production by Normal (Dr Robert W Pumper, Herbert M Yamashiroya and Lawrence J Alfred), 1101
Unique *α*-Glutamyl Peptidase Activity Histochemical Characterization of a (Glutamyl Peptidases in Rat and Guinea Pig Kidney Slices), (George G Glenner and John E Folk), 339
Unit of Light Photometric Standards and the (J S Preston), (National Physical Laboratory, Notes on Applied Science No 24), 1250
Unit Cell (Space Group and), of the *m*-Bromobenzoate of Photoisopyrocalciferol (Prof G L Hardgrove), 551
Unitary Hypothesis Mechanism of Streptomycin Action on Bacteria—a (Dr Charles R Spotts and Prof R Y Stanier), 633
United Kingdom The Common Market and the (Westminster Bank, Ltd), 801
  Training of Industrial Food Scientists and Technologists in the (British Association for the Advancement of Science, Section B (Chemistry), Discussion on), 302

INDEX

- United Kingdom Atomic Energy Authority Promotion of J C Martin (of the Atomic Weapons Research Establishment, Aldermaston) to Senior Principal Scientific Officer, 215
  - Promotion of Dr J B Taylor (of the Atomic Weapons Research Establishment, Aldermaston) to Senior Principal Scientific Officer, 215
  - Resignation of J B W Cunningham as managing director of the Engineering Group, 505
  - Appointment of H V Disney as managing director of the Engineering Group, 505
- United Kingdom Expenditure on Science, Technology and Education, 1130
- United Kingdom Fire Statistics, 1960—Statistical Analysis of Report of Fires attended by Fire Brigades in the United Kingdom during 1960, 1131
- United Nations Conference on New Sources of Energy, 407
- United Nations (Food and Agriculture Organization) The State of Food and Agriculture (1961), 1028
- United Nations (Fisheries Division of the Food and Agriculture Organization) Conference on Fish, 1013
- United Nations (World Health Organization) Public Health Papers No 8, The Role of Immunization in Communicable Disease Control, 20
  - Technical Report Series No 223, Programme Development in the Mental Health Field—Tenth Report of the Expert Committee on Mental Health, 932
- United Nations (World Health Organization Regional Office for Europe), and the International Labour Organization Conference on Health Services in Small Factories, 618
- United States Electron Microscopy in the (Dr A R Taylor), 610
  - Expectation of Life in the, 515
  - Industrial Research and Development in the, 809
  - Population Trends in the U S S R and the, 1142
- United States, 1870-1950 Population Redistribution and Economic Growth (Prof Simon Kuznets, Ann Ratner Miller and Richard A Easterlin), *review* by Prof E Grebenik, 853
- United States Air Force Cambridge Research Laboratories, Bedford, Mass Changes at the, 307
- United States Building Research Institute, 507
- United States National Academy of Sciences Kimber Gold Medal for genetics awarded to Prof J B S Haldane, 710
- United States National Bureau of Standards Appointment of Dr Ralph P Hudson as head of the Heat Division, 309
  - Appointment of Dr Y Beers as chief of the Millimeter-Wave Research Section, 403
  - Appointment of Dr R P Madden to the Atomic Physics Division, 507
  - Appointment of Dr F Ralph Kotter as chief of the newly established High Voltage Section of the Electricity Division, 710
  - Appointment of Dr Thomas R Lawrence as a member of the Metrology Division, 710
  - 1962 International Conference on Precision Electromagnetic Measurements, 922
  - Appointment of J R Johler as chief of the new Applied Electromagnetic Theory Section, 1129
- United States National Institutes of Health, Bethesda, Maryland Medical Research and the (Dr Carl R Brewer), 791
- United States National Science Foundation Scientists and Engineers in the Federal Government, October 1958, 800
  - Surveys of Science Resources Series, NSF 61-32, Funds for Research and Development in Industry (1958), 809
  - Further allocation of 1,500,000 dollars for research work in the Antarctic, 919
  - Appointment of Dr Randal M Robertson as associate director (research), 922
  - Grant of 296,700 dollars to the University of Chicago, for a 4-MeV Van de Graaff machine, 1239
  - Grant of 700,000 dollars to Michigan State University, towards a 40-MeV cyclotron, 1239
  - Grant of 977,600 dollars to the University of Pittsburg, towards an 18-MeV three-stage Van de Graaff machine, 1239
  - Grant of 1,240,000 dollars to the University of Washington (Seattle), towards a 22-MeV three-stage Van de Graaff machine for the Physics Department, 1239
  - Grant of 499,200 dollars to Ohio State University, for a 5 5-MeV Van de Graaff machine, 1239
  - Grant of 498,000 dollars to the State University of Iowa, for a 5 5-MeV Van de Graaff machine, 1239
- United States Naval Radiological Defense Laboratory, San Francisco Appointment of Dr Olivier Heroux as scientist-in-residence, 1026
- United States Research Activities in the Antarctic, 919
- United States Weather Bureau Grant from the United States National Science Foundation, for the Antarctic Meteorological Research Program, 919
- Universal Language for Computing Machines (Dr A D Booth), 22
- Universities Research in the (Rt Hon Viscount Hailsham), 787
- Universities of the British Commonwealth, Association of Appointment of delegates to the Ninth Quinquennial Congress of Universities of the Commonwealth, 115
  - Appointment of Sir Douglas Logan as vice-chairman, 922
- Universities of the Commonwealth Appointment of delegates to the Ninth Quinquennial Congress of (Association of Universities of the British Commonwealth), 115
- Universities in France—Freedom and Autonomy (Prof M Bouchard), 212
- Universities and Colleges in receipt of Treasury Grant, Academic Year 1959-1960 Report from (University Grants Committee), 617, 786
- University The State and the Freedom of the, 212
- University of Birmingham Appointment of R G Bird as lecturer in civil engineering, 406
  - Appointment of Dr J S Hough as senior lecturer in charge of the Sub-Department of Malting and Brewing in the Department of Biochemistry, 406
  - Appointment of A W Kwiatkowski as lecturer in mechanical engineering, 406
  - Appointment of G Martelli as lecturer in physics, 406
  - Appointment of Dr L Riddiford as senior lecturer in the Department of Physics, 406
  - Appointment of Dr K R Rushton as lecturer in civil engineering, 406
  - Appointment of Dr R B Shearn as lecturer in chemical engineering, 406
  - Appointment of N B W Thompson as lecturer in physical metallurgy, 406
  - Appointment of T Duthie as Wilmot Breeden Fellow in the Department of Mechanical Engineering, 406
  - Appointment of Dr H Kaliszer to a Research Fellowship in mechanical engineering, 406
  - Appointment of B K Gazey to a Research Fellowship in electrical engineering, 406
  - Appointment of R J Heitzmann to a Research Fellowship in chemistry, 406
  - Appointment of Dr A E Pedler and Dr C A Barson as senior Research Fellows in the Department of Chemistry, 406
  - Appointment of Dr B Henderson to a Research Fellowship in physical metallurgy, 406
  - Appointment of G R Orgam to a Research Fellowship in industrial metallurgy, 406
  - Appointment of B Walker to a Research Fellowship in industrial metallurgy, 406
  - Appointment of Dr S Swierszczewski to a Research Fellowship in nuclear physics, 406
  - Appointment of J R Turcan to a Research Fellowship in engineering production, 406
  - Appointment of C J H Williams as James Watt Research Fellow in the Department of Mechanical Engineering, 406
  - Appointment of Dr J S Brimacombe as lecturer in the Department of Chemistry, 507, 1241
  - Appointment of Dr F Rieband as lecturer in the Department of Mechanical Engineering, 507, 1241
  - Appointment of E D R Shearman as senior lecturer in electromagnetism in the Department of Electrical Engineering, 507, 1241
  - Appointment of Dr E C Grant as Research Fellow in the Department of Medical Biochemistry and Pharmacology, 507
  - Appointment of Dr D E N Davies as lecturer in the Department of Electrical Engineering, 1241
- University of Bristol Appointment of C Andrew as lecturer in mechanical engineering, 710
  - Appointment of Dr R Binks as lecturer in organic chemistry, 710
  - Appointment of J S E David as lecturer in veterinary surgery—diseases of reproduction, 710
  - Appointment of Dr R P Mercier as lecturer in theoretical physics, 710
  - Appointment of Dr J G C Milne as lecturer in physics, 710
  - Appointment of D B Peacock as lecturer in bacteriology, 710
- University of Cambridge Election of J A Pateman and C K Phillips to Fellowships at Churchill College, 710
  - Election of J S Gibson to a Junior Research Fellowship at Churchill College, 710
  - Election of Prof Jacques Barzum and Prof Kenneth J Arrow to Extraordinary Fellowships at Churchill College, 710
  - Election of Dr P W Anderson to an Overseas Fellowship at Churchill College, 710
  - Graduate Extension of Corpus Christi College, 922
- University of Chicago Grant of 296,700 dollars from the United States National Science Foundation, for a 4-MeV Van de Graaff machine, 1239
- University of Dublin Appointment of Dr R G S Hudson to the chair of geology and mineralogy at Trinity College, 1022
- University of Durham Lanehead Field Centre, 404
  - Digital Computation at King's College, Newcastle-upon-Tyne, 708
- University of Edinburgh Appointment of I W Sutherland as lecturer in bacteriology, 507
  - Appointment of J Shepherd as lecturer in electrical engineering, 507
  - Appointment of W Dudgeon as senior lecturer in engineering, 507
  - Appointment of J A Linnet as lecturer in engineering, 507
  - Appointment of Dr S Soundranayagan as lecturer in engineering, 507
  - Appointment of H Montgomery as lecturer in pathology, 507
  - Appointment of M B Smith as lecturer in pathology, 507
  - Appointment of Dr P D Mitchell as senior lecturer in zoology, 507
  - Appointment of Dr M E Davies as lecturer in the Department of Veterinary Bacteriology, 922
  - Appointment of B F Leek as lecturer in the Department of Veterinary Physiology, 922
- University of Exeter The Norman Lockyer Observatory (Prof G K T Conn), 108
  - Retirement of D R Barker as superintendent of the Norman Lockyer Observatory, 112
- University of Glasgow Appointment of Adam Fleck to a lectureship in biochemistry, 1132
  - Appointment of N J McCorkindale, Dr I C McNeill, K C Campbell and A L Porte to lectureships in chemistry, 1132
  - Appointment of W T Morton to a lectureship in experimental physics, 1132
  - Appointment of D L Pursey to a lectureship in theoretical physics, 1132
  - Appointment of A J Baker as Glaxo Fellow in chemistry, 1132
  - Fellowships in genetics awarded to G L le Bouvier, June Dixon and K R Dronamraju, 1132
  - Fellowships in nuclear physics awarded to John Cumming, A W Hendry and J G Lynch, 1132
  - Fellowships in organic chemistry awarded to Robert McCrindle, M B Meyers and R D H Murray, 1132
  - Fellowship in physics awarded to R M Turnbull, 1132
  - Fellowship in solid-state physics awarded to J D Roycroft, 1132
  - Associated Electrical Industries (RS2) High-resolution Nuclear Magnetic Resonance Spectrometer now in operation in the Chemistry Department, 1132
- University of Hong Kong Symposium on Muscle Receptors, 805
- University of Leeds Appointment of G J Bibby and Dr A E D Heylen to lectureships in the Department of Electrical Engineering, 406
  - Appointment of Dr M Holmes to a lectureship in the Department of Civil Engineering, 406
  - Annual Report of the Court, 1241
- University of Liverpool Liverpool College of Technology admitted to affiliation with the University, for a period of three years, 406
  - The New Mathematics and Oceanography Building of the (Prof L Rosenhead), 1133

- University of London Postgraduate Courses at the Imperial College of Science and Technology, 115
  - Appointment of Dr J P Quilliam to the newly created chair of pharmacology at St Bartholomew's Hospital Medical College, 210
  - Grant of £40,000 from the Wellcome Trust to University College, for the extension to the Pharmacology Building, 212
  - Grant of £13,500 from the Wellcome Trust to the Imperial College of Science and Technology, for the purchase of a nuclear magnetic resonance spectrometer, 212
  - Title of professor of social statistics in the University (at the London School of Economics and Political Science) conferred on C A Moser, 406
  - Appointment of Dr J Clunie to a readership in mathematical analysis at the Imperial College of Science and Technology, 507
  - Appointment of Prof K G Denbigh to the Courtaulds chair of chemical engineering in the Imperial College of Science and Technology, 710
  - Title of professor of geography (at University College) conferred on Dr W R Mead, 710
  - Title of professor of organic chemistry (at the Imperial College of Science and Technology) conferred on Dr L N Owen, 710
  - Title of reader in anatomy (at University College) conferred on D W James, 710
  - Title of reader in chemistry (at University College) conferred on Dr C A Vernon, 710
  - Commemoration Day Address at the Imperial College of Science and Technology, Research in the Universities (Rt Hon Viscount Hailsham), 787
  - Title of professor of theoretical physics (at the Imperial College of Science and Technology) conferred on Dr P T Matthews, 802
  - Appointment of Dr K A Kermack to a readership (at University College) in vertebrate palaeontology, 802
  - Appointment of C H Lack to a readership (at the Institute of Orthopaedics) in bacteriology, 802
  - Appointment of Dr J E Prentice to a readership (at King's College), in geology, 802
  - Appointment of Dr M Schacter to a readership (at University College) in physiology, 802
  - Appointment of Dr Gordon Smith to a readership (at the London School of Hygiene and Tropical Medicine) in virology, 802
  - Appointment of Dr Maynard Smith to a readership (at University College) in zoology, 802
  - Appointment of Dr G L Watson to a readership (at University College) in mathematics, 802
  - Research Report 1958-61 of the City and Guilds College (Imperial College of Science and Technology), 802
  - Appointment of Dr B W Lacey to a chair of bacteriology in Westminster Medical School, 922
  - Appointment of D G MacRae to the chair of sociology in the London School of Economics and Political Science, 922
  - Appointment of Dr E A Power to the readership in applied mathematics at University College, 922
  - Appointment of J L Stollery to the readership in aeronautics at the Imperial College of Science and Technology, 922
  - Title of professor of molecular spectroscopy (at the Imperial College of Science and Technology) conferred on Dr A G Gaydon, 922
  - Transfer of Prof J T Randall to the chair of biophysics at King's College, 922
  - Nematology at the Imperial College of Science and Technology (Prof B G Peters), 1027
  - History of Science and Technology at the Imperial College of Science and Technology, 1131
  - Appointment of Prof Michael Abercrombie to the Jodrell chair of zoology and embryology in University College, 1132
  - Appointment of Dr J R Butler as reader in pure geochemistry at the Imperial College of Science and Technology, 1132
  - Appointment of J C G Coleridge as reader in physiology at the Royal Free Hospital School of Medicine, 1132
  - Appointment of Dr S J Taylor as reader in mathematics at Westfield College, 1132
  - Appointment of S B Watkins as reader in chemical engineering at King's College, 1132
  - Appointment of Dr F W O'Grady as reader in bacteriology at St Bartholomew's Hospital Medical College, 1132
  - Appointment of Dr J C Anderson as reader in electrical engineering at the Imperial College of Science and Technology, 1132
  - Title of professor of civil engineering (at King's College) conferred on J K T L Nash, 1132
  - Title of professor of powder technology (at King's College) conferred on Dr H E Rose, 1132
  - Title of professor of electrical engineering (at the Imperial College of Science and Technology) conferred on Dr J H Westcott, 1132
  - Title of reader in pure mathematics (at Queen Mary College) conferred on Dr K W Gruenberg, 1132
  - Title of reader in engineering science (at King's College) conferred on Dr J M Zarek, 1132
- University of London Institute of Orthopaedics Appointment of C H Lack as reader in bacteriology, 802
- University of Manchester Appointment of Dr Colin Adamson to a newly created (second) chair of electrical engineering, 403
  - Appointment of J R D Francis as professor of municipal engineering, 403
  - Appointment of Prof P J Collard as professor of bacteriology and director of the Department of Bacteriology, 406
  - Summer School in Analytical Chemistry at the Manchester College of Science and Technology, organized by the Royal Institute of Chemistry, 608
  - Course of lectures on Problems of Radioactivity at Water and Sewage Works, in the Department of Municipal Engineering of Manchester College of Science and Technology, 609
- University of Miami Appointment of Dr Carl H Oppenheimer as research associate professor at the Institute of Marine Science, 710
- University of Oxford Grant of £48,000 from the Fleming Memorial Fund for Medical Research, for the Sir William Dunn School of Pathology, 404
  - Summer School in Theoretical Chemistry, 609
  - Honorary doctorate of science conferred on Prof J B S Haldane, 710
  - Imperial Forestry Institute re-named the Commonwealth Forestry Institute, 802
- University of Oxford Expedition to Peru, 1961 (R C Herrera), 610
- University of Perugia Medical School Cancer Research in the (Prof. Lucio Severi), 217
- University of Pittsburgh Grant of 977,600 dollars from the United States National Science Foundation, towards an 18-MeV three-stage Van de Graaff machine, 1239
- University of Rochester Proceedings of the 1960 Annual International Conference on High Energy Physics (edited by E C G Sudarshan, J H Tinlot and A C Melissinos), *review* by Dr G H Stafford, 7
- University of Southampton Title of reader in botany conferred on Dr J M Lambert, 115
- University of Southampton (N A T O Advisory Group for Aeronautical Research and Development and the) Seminar on Astronautics, 310
- University of Sussex Appointment of Dr C Eaborn as professor of chemistry, 18
  - Appointment of Dr R J Blin-Stoyle to the chair of theoretical physics, 504
  - Prospectus (1961-62), 619
  - Appointment of Dr K F Smith to the chair of experimental physics, 707
  - Appointment of Dr D B Scott as professor of mathematics, 1241
  - Appointment of Dr E R A Peeling as senior lecturer in chemistry, 1241
- University of Texas Sixteenth Annual Symposium on Fundamental Cancer Research (Conceptual Advances in Immunology and Oncology), 1132
- University of Wales Grant of £15,000 from the Wellcome Trust to the University College of South Wales and Monmouthshire, Cardiff, for the purchase of an electron microscope for the Department of Anatomy, 212
  - Grant of £9,850 to the University College of North Wales, Bangor, to increase the accommodation for postgraduate research workers in the Department of Zoology, 212
  - Appointment of G Westby to the new chair of psychology in the University College of South Wales and Monmouthshire, 918
- University of Washington (Seattle) Grant of 1,240,000 dollars from the United States National Science Foundation, towards a 22-MeV three-stage Van de Graaff machine for the Physics Department, 1239
- University (Johns Hopkins), (sponsored by the McCollum-Pratt Institute of the, with support from the National Science Foundation) A Symposium on Light and Life (edited by William D McElroy and Bentley Glass), *review* by Dr V S Butt, 296
- University, (Michigan State) Grant of 700,000 dollars from the United States National Science Foundation, towards a 40-MeV cyclotron, 1239
- University (National), of Ireland Retirement of Prof J Doyle from the chair of botany in University College, Dublin, 1238
  - Appointment of Dr Phyllis M Clinch to the chair of botany in University College, Dublin, 1238
- University (New York) Combination of its two Physics Departments into a single all-University Department, and appointment of Prof Bruno Zumino as its head, 507
- University (Ohio State) Grant of 499,000 dollars from the United States National Science Foundation, for a 5 5-MeV Van de Graaff machine, 1239
  - Symposium on Molecular Structure and Spectroscopy, 1241
- University (Princeton) Mathematical Series, Vol 26, Riemann Surfaces (Prof Lars V Ahlfors and Prof Leo Sario), *review* by Prof W K Hayman, 847
  - Fellowships in Engineering Study and Fundamental Research in Plastics, 921
- University (Rutgers State) Center of Alcohol Studies transferred from Yale University to, 404
- University (Stanford) Stanford Studies in Mathematics and Statistics, No 2, Contributions to Probability and Statistics—Essays in Honor of Harold Hotelling (edited by Ingram Olkin, S G Ghurye, Wassily Hoeffding, William G Madow and Henry B Mann), *review* by Dr D E Barton, 846
- University (State), of Iowa Grant of 498,000 dollars from the United States National Science Foundation, for a 5 5-MeV Van de Graaff machine, 1239
- University (Yale) Center of Alcohol Studies transferred to Rutgers State University, 404
- University College, Dublin Retirement of Prof J Doyle from the chair of botany, 1238
  - Appointment of Dr Phyllis M Clinch to the chair of botany, 1238
- University College of East Africa, Nairobi Grant of £4,000 from the Wellcome Trust, to provide a mobile laboratory for field research in comparative physiology, 212
- University College, Ibadan Calendar for 1961-62, 710
- University College, London Grant of £40,000 from the Wellcome Trust, for the extension of the Pharmacology Building, 212
  - Title of professor of geography conferred on Dr W R Mead, 710
  - Title of reader in anatomy conferred on D W James, 710
  - Title of reader in chemistry conferred on Dr C A Vernon, 710
  - Appointment of Dr K A Kermack as reader in vertebrate palaeontology, 802
  - Appointment of Dr M Schachter as reader in physiology, 802
  - Appointment of Dr Maynard Smith as reader in zoology, 802
  - Appointment of Dr G L Watson as reader in mathematics, 802
  - Appointment of Dr E A Power to the readership in applied mathematics, 922
  - Appointment of Prof Michael Abercrombie to the Jodrell chair of zoology and embryology, 1132
- University College of North Staffordshire Extension to Department of Physics, (Prof D J E Ingram), 912
- University College of North Wales, Bangor Grant of £9,850 from the Wellcome Trust, to increase the accommodation for postgraduate research workers in the Department of Zoology, 212
- University College of Rhodesia and Nyasaland Appointment of Dr A D Kemp as lecturer in organic chemistry, 922
- University College of South Wales and Monmouthshire, Cardiff Grant of £15,000 from the Wellcome Trust, for the purchase of an electron microscope for the Department of Anatomy, 212
  - Appointment of G Westby to the new chair of psychology, 918
- University Education in Ghana (Dr C T Mortimer), 14
- University Finance in Britain (1959-1960), 617

University Grants Committee Returns from Universities and Colleges in receipt of Treasury Grant, Academic Year 1959-1960, 617, 786
University Service (World) Student Mental Health—Report of a Conference held in London (1961), 620
University Support, 1960-61 (National Research Council and Medical Research Council of Canada), 308
Unknown Auxin from a Solution of Indole-3-Acetic Acid labelled with Carbon-14 Isolation of an (Prof J H M Henderson), 1076
Unsaturated Uronide (A New), isolated from Alginase Hydrolysate (Isami Tsujino and Tsuneyuki Saito), 970
Unstable Flow of Molten Polymers (J J Benbow, R V Charley and P Lamb), 223
Unusual Major Fatty Acid Component in Human Depot Fat (Dr D S McLaren and W W C Read), 265
Upper Atmosphere Winds and Circulation in the (Royal Meteorological Society Symposium on), 12
  A Working Model for the (Luigi G Jacchia), 1147
Uptake of Amino-Acids by Plant Roots Effect of Plant Growth Compounds on (D E Wright), 1044
Uptake of Calcium-45 in the Adrenal Gland Stimulation of, by Acetylcholine (Prof W W Douglas and A M Poisner), 1299
Uptake of Injected Norepinephrine Particle-bound and Free Catecholamines in Dog Hearts and the (A Wegmann and K Kako), 978
Uptake of Iron-59 in Incubated Rat Red Cells *in vitro* Effect of Hydrocortisone on (Peggy Clark), 667
Uptake of Oxygen by Red Cells Effect of Quinones on the (D Lovell and Dr T A J Prankerd), 561
Uptake and Incorporation of Tritiated Thymidine in *in vitro* Culture (Dr W M Rigal), 768
Uptake (Glucose), and Intracellular Accumulation of Amino-Acids in Rat Kidney Slices *in vitro* Paradoxical Effect of Phlorizin on (Dr Stanton Segal, Alberta Blair and Leon E Rosenberg), 1085
Uranium in the Sikhote–Alin Meteorite and its relation to the Lead Method of Age Determination (Edward L Fireman and David E Fisher), 644
Uranium Chlorides Organic Extraction from Fused (M Taube and Z Borkowska), 745
Uranium Research Foundation (Canadian) Grant of 10,000 dollars a year to the British Columbia Research Council, for investigation into the use of uranium compounds as toxicant additives to wood impregnants for marine borers, 516
Urea Influence of *p*H and, on the Ultra-violet Fluorescence of several Globular Proteins (Dr R F Steiner and H Edelhoch), 873
Urea (Glycine, Serine and) Some Tetrahydropyranyl Derivatives of (S M Amir, Dr M Z Atassi, Dr S A Barker, Dr J S Brimacombe and Dr M C Keith), 1069
Urea Cadmium Nitrate Crystallographic Data for Urea Calcium Nitrate and (Dr C G C Catesby), 254
Urea Calcium Nitrate and Urea Cadmium Nitrate Crystallographic Data for (Dr C G C Catesby), 254
Urea Ingestion Effect of, on Parotid Salivation in Sheep (A D Wilson), 271
Uri, Dr N (Bennett, Dr G J, and) A Novel Type of Antioxidant related to Polyporic Acid, 354
Uridine Diphosphoglucose Dehydrogenase in Cartilage Histochemical Localization of (Dr Karoly Balogh, jun, and Richard B Cohen), 1199
Uriel, José (Stock, A H, and) Esterase of Group A Streptococci—Electrophoretic Mobility and Detection of Haemolytic Activity of Streptolysins *O* and *S* in Agar-Gel, 435
Uriel, José, and others Extracellular Esterase of Group *A* Streptococci—Esterase in Extracellular Concentrates of Group *A* Streptococci and the Homologous Antibody, 434
Urinary Calculi (Uncrystallized) composed of Glycolipo-Protein Excretion of, by Normal and Muscular Dystrophic Mice (C McGaughey), 1267
Urinary Conjugated Œstrogens Purification of, by Gel Filtration (C G Beling), 326
Urine (Human) Identification of an Amylobarbitone Metabolite in (J V Jackson and M S Moss), 553
Uritani, Dr I Biochemistry of Plant Phenolic Substances (Role of Plant Phenolics in Disease Resistance and Immunity), 418
Uronic Acid Contents Cation-Exchange Capacities of Tissues of Higher and Lower Plants and their related (A H Knight, W M Crooke and R H E Inkson), 142
Uronide (A New Unsaturated), isolated from Alginase Hydrolysate (Isami Tsujino and Tsuneyuki Saito), 970
Urquhart, D H Cocoa, second edition, *review*, 592
Usborne, W R, and others Radioactivity in Wool, 1094
Use of Antibiotics to purify Blue-Green Algae (Blue-Green Algae), (Dr Y T Tchan and J Gould), 1276
Use of Fire by Early Man Possible Origin of the (D C Arnold), 1318
Use in Gas Dynamic Studies Bibliography of Tables and Charts for (D E Randall), 308
Use of Isotopes in Haematology (Dr L G Lajtha), *review* by Dr I Chanarin, 903
Use of Phenol in Determining Chromatographic Purity (B H Koeppen), 360
Use of Phenol in the Isolation of Erythropoietic Glycoprotein (Peter H Lowy and Geoffrey Keighley), 75
Use of Tetrazolium Compounds in Oxidative Enzyme Histo- and Cyto-Chemistry (Prof C G Rosa and Kwan-Chung Tsou), 990
Use of Very High, Continuous Magnetic Fields Advances in the Generation and (Dr Henry H Kolm), 299
Use (Land), in Arid Regions A History of (edited by Prof L Dudley Stamp), (Unesco, Arid Zone Research No 17), 1236
Use (Potential), in Agriculture Venturicidin, a New Antifungal Antibiotic of (A Rhodes, K H Fantes, B Boothroyd, Moira P McGonagle and R Crosse), 952
Use and Control in Industrial Application Radiation— (Dr Charles Wesley Shilling) *review* by B E Jones, 855
Use and Disposal (Nature,) Atomic Energy Waste—its (edited by E Glueckauf), *review* by A W Kenny, 846
Use (Better), of the World's Fauna for Food (Institute of Biology Symposium on), 21, 1112
Use (The Preparation and), of Case Studies (South London Branch of the British Institute of Management Conference on), 21
Uses Woody Plants of Ghana with special reference to their (Dr R F Irvine), *review* by W D Clayton, 695
Uses of Indian Timbers Identification, Properties and, *review* by Dr C R Metcalfe, 1110
Uses (Peaceful) Applications of Science to, *review* by R Brightman, 850
U S S R Gas Dynamics in the, *review* by Dr I S Donaldson, 837
  Geological and Geographical Research in the, 114
  Population Trends in the (Population Reference Bureau, Inc, *Population Bulletin*, Vol 17, No 6), 1142
U S S R Biochemical Society Fifth International Congress of Biochemistry, 1115
Uterine Smooth Muscle Sodium Influx and Excitation in (Prof C Y Kao, Dr D Zakim and Dr F Bronner), 1189
Uterine Tumours in Mice A Carcinogenic Action of Testosterone, provoking (Dr R van Nie, Dr E L Benedetti and Prof O Muhlbock), 1303
Utilization of Protein by Calves Comparative Effects of Wet and Dry Feeding on the (A M Raven and K L Robinson), 1256
Utilization of Sheep Red Blood Cells in the Haemadsorption Test for Myxoviruses (H M Yamashiroya, Dr R W Pumper and B R Tess), 582
Utilization (Microbial), of Olefins Incorporation of Molecular Oxygen during (Tomoyuki Ishikura and J W Foster), 892

VAAS, K F The Better Use of the World's Fauna for Food (Fish Culture in Freshwater and Brackish Ponds), 1114
Vacuolation and Leaf Regeneration in *Splachnum ampullaceum* (L) Hedw (Prof Kraft E von Maltzahn)—Formation of Secondary Vacuoles in De-differentiating Cells, 55, Effect of Kinetin on Attached Leaf Regeneration, 56
Vacuum Production of 'Active' Magnesium Oxide by Heating in (R Valverde and J P Saenz, 653
Vaginal Œstrus (Persistent) Luteinizing Hormone in (Dr G P van Rees and Dr J J van der Werff ten Bosch), 876
Valence State of Platinum–Alumina Catalysts (R J Bertolacini), 1179
Validity of Prediction based on Cross-Sectional Analysis (Gwynneth de la Mare and R Sergean), 1318
Value (Osmotic), in Pea Stem Sections Effect of Auxin on the (Shizuko Yoda and Joji Ashida), 577
Values of the Function

$$w(z) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,dt\right)$$

for Complex Argument Table of (V N Faddeyeva and N M Terent'ev), edited by V A Fok, (translated from the Russian by D G Fry), *review* by Prof C A Coulson, 97
Valverde, R, and Saenz, J P Production of 'Active' Magnesium Oxide by Heating in Vacuum, 653

CREATIVE ABILITY

IN his presidential address to Section F (Economics) at the British Association meeting at York in 1959, Prof John Jewkes asked some searching questions about accepted correlations between industrial output and the number of scientists and technologists, and suggested that we needed better criteria for determining how much of its resources the community should devote to science and technology Prof Jewkes's views on the shortage of scientists were promptly challenged by Sir Solly Zuckerman, particularly in the light of figures afterwards issued by the Scientific Man-power Committee of the Advisory Council on Scientific Policy, although Sir Solly agreed entirely as to the need for more satisfactory criteria In the past two years there has been no serious suggestion that the supply of scientists or technologists is increasing unduly Shortages of particular categories of scientists, as, for example, teachers of mathematics, have, however, emphasized the soundness of some of Prof Jewkes's remarks about the decisions required in striking the right balance between the numbers of scientists and technologists

This is equally true of Prof Jewkes's comment on the extreme importance of employing the scientists and technologists we already have to the best effect, a matter on which Prof Jewkes already had some doubts This year, at Norwich, his successor as president of Section F devoted the whole of his presidential address to an examination of the conditions which affect the economic use of intellect Prof C F Carter also has reservations as to the extent of the alleged shortage of scientists and technologists He finds no evidence that the present educational system of Britain is biased towards arts subjects On the contrary, he believes that the specialized study of science and technology is in danger of attracting an undue proportion of able minds, and that, at the higher levels of ability, it is more significant to examine the general shortage rather than the specialist deficiencies

Prof Carter begins, indeed, by stressing the importance of the supply of first-rate ability All too often in discussions on trained man-power, or university or technical education, or in such matters as training for management, there is a disposition to ignore the importance of really first-rate ability and its implications to-day and to concentrate on the needs and the supply of the middle and lower ranges of ability Prof Carter rightly points out that, leaving aside for the moment the question of how limited is the supply of such ability, its importance relative to other natural resources increases as technology becomes more complex, and because ideas and methods of organization and working are capable of being copied, those of the highest ability, ingenuity and inventiveness, who are an example to others, are of special importance It is the supply of first-rate ability which determines the speed of change, all other shortages being of secondary importance

Nevertheless, Prof Carter contends that we have given surprisingly little thought to the nature and proper use of this factor, and that there is considerable need for further study and research It is, of course, difficult to define what is meant when in common speech we talk of an 'able man' We do not mean one whose only skill is the perfect performance of a very narrow task The shortage of the higher forms of ability, Prof Carter points out, is a shortage of men capable of dealing with new and unexpected tasks within a certain range, and who are not confined within too narrow a specialization We are looking for an intelligence which is capable of analysing a new situation and reacting to it in a sensible way, and this quite clearly is something which will be found independently of the particular disciplines in which that intelligence has been trained

We are thus at once reminded of the importance of general education itself—but Prof Carter is not deflected from his main discussion Something more is required than developed intelligence, and he notes that since people can be intelligent but ineffective, the causes of ineffectiveness themselves may well be worthy of more attention In fact, serious errors are frequently made in both directions in our judgment as to how intelligent men will react to the stress of responsibility, while Prof Carter does not doubt that scientific selection procedure can reduce these errors, he also considers that personnel selection at the highest levels has far to go before it can claim to be very scientific

Properly speaking, the waste of ability due to failure to find appropriate occupation—because of adverse social or economic conditions during the educational period—is scarcely a matter of the economic use of brains, though it is the aspect that has most commonly been considered Prof Carter, moreover, is hesitant in accepting the conclusion, drawn from reports such as *Early Leaving*, which demonstrate a continuing connexion between a long and successful educational career and high social class of the parents, that the supply of able people will necessarily be increased by a wider and better educational system He questions, in fact, whether improved educational provision will necessarily produce this result, though he agrees that we might be able to alter the supply of ability if we could alter the social structure or environment in some relevant way As yet, however, we do not know which of the inter-related characteristics of a poor social environment are most important in restricting the development of a child, and it is highly probable that while change of this kind may, in fact, be proceeding, it is a long-term process. Further, it is equally possible that the ultimate result of all such changes will be increased numbers in the middle ranges of ability rather than in the high levels of ability with which Prof Carter is primarily concerned in this address

For such reasons, Prof Carter is indisposed to accept, on the evidence available, that there is plenty of high ability available, at present running to waste, and easily conserved, and he turns to discuss the question of what is the best use of an able man's time Prof Carter at once recognizes the extreme difficulty of finding any satisfactory criteria, quite apart from the extent to which the personal idiosyncrasies of ability must be recognized and given due allowance The complex nature of intellectual effort does not permit any ready separation of easy or routine tasks and those of greater complexity or strenuous activity While it is important that the best qualities of mind and experience should be available to deal with difficult, controversial and complicated matters, it is seldom possible to filter out all lesser problems and deal with them at a lower level in the organization It might be possible to design information systems which could help here in taking care of the lesser problems, but there would remain the problem of how experience is to be gained by the high ability which is coming on; and there is also liable to be disagreement as to function and ability Prof B R Williams and Prof Carter found in their industrial studies, in fact, that very little attention had been given to the science of using scientists productively, and he suggests in the present address that in all forms of work which use high ability, there is need for much more study of the conditions which favour effective work. He considers that there are valuable principles to be discovered and reforms to be made

It is curious, in view of the dearth of material to which Prof Carter refers, that he makes no reference to the report of the Barlow Committee on Scientific Staff, issued in 1945, which provided one of the best analyses of the conditions for effective scientific work, at least in the Government service, which has yet appeared He notes, indeed, that men of high ability are often in positions in which they are able to create their own conditions of work, though at the same time he points out that the economic use of brains may involve protecting a man from the self-imposed wastage of his talents, as well as giving him freedom to use them to the full What needs to be said here, above all, is that it is not so much fresh knowledge about the conditions conducive to effective work—whether it be creative or administrative—at the highest level that is required, but the perceptive application of existing knowledge So far as the Government is concerned, disregard of what is already known about such conditions is largely responsible for much of the present frustration and wastage, particularly among scientific staffs, and it would seem a sufficiently important matter to warrant attention by the Minister for Science or the Advisory Council for Scientific Policy

From this aspect of the efficient use of distributed man-power, Prof. Carter turns to discuss the distribution of ability between different occupations Here he suggests that the determinant factor is the initial choice of occupation, and he stresses the desirability of greater attention to factors which promote mobility between different occupations Desirable in itself on the grounds of experience, such mobility is a corrective to mistaken or excessive choice of particular occupations, and all the more in that there is still much to learn about factors influencing the initial choice of occupation Moreover, the choice at present seems often to be needlessly haphazard, it should be possible even with existing knowledge for this choice to be much better informed both in regard to the potentialities of the boy or girl, and the advantages or responsibilities to be found in the occupations to which specialization leads

The present shortage of mathematics teachers underlines the importance of Prof Carter's remarks on the distribution of high ability between the universities and elsewhere Surveys of the employment of graduates made by Political and Economic Planning and other similar surveys have given no full answer to such questions as the distribution of high ability between expanding and declining, or modern and traditional industries, between large and small firms, between different parts of Britain, between the nationalized industries and other parts of the public service Yet under certain conditions this could be the decisive factor in the success or failure of an industry or a firm, and despite the imperfections of definitions of ability, more research on these matters and on the trends in the demands of various industries and services is needed

By and large, Prof Carter outlines very fairly the problems in this field that require attention, although he is inclined to make too little of what could be done with existing knowledge and resources. Curiously enough, while he takes a much less optimistic view as to the existence or extent of the pool of ability on which we can draw than did Prof. G Seth in addressing Section J (Psychology), he ignores completely, as such, the reservoir of ability to be found in the employment of women which, Prof Seth notes, could go far to meet any existing shortage of skilled talent Further, he does not discuss the contribution which improved methods of teaching could make, either in the development of the student or in the more efficient use of the time of the trained teacher Two points, however, should be noted in conclusion Prof Carter fully recognizes that the effective use of trained man-power in the universities is not simply a matter of using the university teacher's time to the best advantage, but is also a part of the national effort in research and the right use of man-power in relation to scarce and expensive scientific equipment —a matter to which also more critical and constructive thought must be given

Finally, there is the question of what economies of scale may be possible in the use of high ability

Prof Carter does not discuss that difficult question in any detail Indeed, he seems to raise it only to illustrate the complexity of all these issues and how readily they may incline to decisions which are self-frustrating or defeating. It is only too easy to take decisions for one purpose only to find that they have created conditions which destroy the incentives it is sought to provide We must indeed recognize the existence of these economic problems and give them the study and attention they need, but it cannot be too carefully kept in mind that nothing is easier than to plan out of existence the conditions in which high, and especially creative, ability functions most effectively and efficiently

PHASES IN EVOLUTION

Grossablaufe der Stammesgeschichte
Erscheinungen und Probleme Von Prof Arno Hermann Muller. Pp vii+116 (Jena Gustav Fischer Verlag, 1961) 18 20 D M

THE work under review is a revised edition of one originally published in 1955 , some of its subject-matter and diagrams have also been incorporated in Vol 1 of its author's *Lehrbuch der Palaozoologie* (1957) Its purpose is to study the fluctuating fortunes, during their long geological histories, of those major animal groups of which abundant fossil remains are preserved, and to draw such general conclusions as seem possible The author uses as data the number of genera recorded in successive subdivisions of the geological column, each representing some 15–18 million years He is not the first palæontologist to have taken up this line of investigation, for an account of very similar work by a group of United States authors has appeared in the *Journal of Paleontology,* 26 (1952) For presentation of the facts he relies mainly on symmetrical diagrams in which the number of genera, grouped according to their time-ranges in differently shaded areas, is plotted horizontally across a median axis representing geological time

The obvious objection to the choice of genera as the basis of the study is that of differing taxonomic standards among workers who have specialized (as most modern palæontologists tend to do) in fossils belonging to particular families or geological formations, for irresponsible genus splitting might well become interpreted as evidence of unusually intense evolutionary diversification By taking his data from treatises in which the material has already been digested according to more or less uniform standards the author has probably avoided this pitfall to some extent In discussing the trilobites he gives two diagrams, based respectively on modern works in which 996 and 1,395 genera are recognized, and he shows that both present the same general picture In the case of Mollusca other than Cephalopoda his information does not appear to be derived from up-to-date sources Thus on p 94 the number of known gastropod genera is given as about 700, whereas in the Wenz–Zilch treatise on this class (1938–60) in the *Handbuch der Palaozoologie* the number of shell-bearing genera recognized is 3,400, the figure 296 given for known genera of Bivalvia (Lamellibranchia) is similarly disproportionately low

It is probable (although some authors deny it) that the concept of a species is less subjective than that of a genus, so that a census of species would have been a more satisfactory basis for the present study According to a recent estimate, however, among invertebrates alone the total number of extinct species with hard parts capable of becoming fossilized has been 7–8 millions, and, even though (according to estimates from other sources) those so far described number only from one-hundredth to one-twentieth of the whole, it would clearly have been beyond the capacity of a single worker to assemble the necessary data about them A count of genera was the only practicable approach to the investigation. One thing is clear , the number of genera and species living at any period does not necessarily bear any relation to the total of adult individuals belonging to a group or give any indication of its relative competitive success The former is incalculable, the latter unassessable

In the work under review the diagrams already mentioned show a succession of bulges and contractions , not one is a steadily broadening triangle, although there is some approach to this with the Gastropoda and Bivalvia A marked bulge corresponds to what the author terms a "Virenzphase", a phase of profuse mutational changes. The most abrupt and intense of such phases are the 'explosive' or 'eruptive bursts' of United States and British writers According to the author, three types of evolutionary history are distinguishable. In the "regressive" type (Trilobita, Graptolithina, Nautiloidea) there is a series of "Virenzphasen" decreasing in intensity and duration and leading eventually to extinction In the "progressive" type there is a succession of such phases increasing in intensity and duration, although ultimately the group may fail to survive a subsequent phase of shrinkage and crisis (For example, during the two intervals, at the close of the Permian and of the Triassic periods respectively, between their three "Virenzphasen" the Ammonoidea almost died out, but two or three genera just managed to survive in each case ; a third crisis at the end of the Cretaceous, however, sealed the fate of the whole order) In the third type of evolutionary history, the "intermediate" type (Brachiopoda, Amphibia), there is a series of complex "Virenzphasen" each consisting of a relatively weak initial phase, an intense main phase, and a weak late phase.

Applying these results to groups now living, the author considers the Nautiloidea, reduced to a single genus following what he believes to be the final phase of a history of the "regressive" type, to be probably well on the way to extinction. The Echinoidea and Reptilia, however, although now on the decline, would appear to have further "Virenzphasen" ahead The Brachiopoda may pass through a weak phase of increase before their final extinction The Mammalia are now passing through the main phase of a "progressive" series , at least, they were doing so before the advent of man

Chapters are devoted to a survey of knowledge of pre-Cambrian life (illustrations of recent finds in South Australia are reproduced in some of the plates) and to a discussion of the various factors which may have combined to determine the history of life through the ages A study of the diagrams in this book suggests to me that the author's three-fold classification is an over-simplification The future, in fact, seems to be entirely unpredictable. L R. Cox

CELLS IN EVOLUTION

Cytology and Evolution

By Dr. E N Willmer Pp x+430 (New York Academic Press, Inc , London · Academic Press, Inc (London), Ltd , 1960) 70*s*

THIS is a scholarly work, for Dr. Willmer has given thought to his subject for many years Inevitably, it is not an easy book to read and assimilate *Cytology and Evolution* is a challenging title , at one extreme, it is concerned with the techniques required to reveal the nature of cellular physiology, and at the other, the infinitely complicated problem of cell evolution in higher organisms Characteristically, Dr Willmer introduces the subject by visualizing "the conversion of the Victorian carriage into the racing car of to-day" as a lesson in evolution He is intrigued by "the mystery of a common organization", and his argument opens by examining the similarity in the fine structure of cilia throughout the lower and higher forms of life

The author knows as much as anyone could about the behaviour of cells isolated from their normal environment and grown in tissue culture From his experience, he has developed the interesting simplification that tissue culture encourages the growth of three stem-lines of cells These are the epitheliocytes, the mechanocytes, and the amœbocytes, and the photographs selected are most effective in illustrating his point of view

The book begins its own organic growth with the definition of these different cell forms, and here the reader meets the first complications in the argument. What, the author has asked himself, are the morphological and physiological features which define an epitheliocyte, a mechanocyte, and an amœbocyte? Many examples can be cited which apparently define or separate one cell from another, such as the strange phenomenon that an epitheliocyte will be unaffected by the death of its neighbour (punctured through his nucleus), while a fibroblastic cell will choose to die along with its neighbouring cell There is also the problem of the permanent cell lines which have been maintained for many years in tissue culture and which appear to have become a 'classless' society

The basic ideas of the author take up one-third of the book , their effect on the analysis of embryogenesis is developed in the remaining two-thirds of the book Dr Willmer takes the reader as gently as possible through the reversible transformation of flagellate cell types to amœboid cell types, as found in certain lower organisms, particularly *Naegleria*, on which he has himself done fascinating work One reader, at least, is concerned that he has chosen only to discuss the transformations in terms of homoiostasis, and does not envisage, for example, the possibility that the ionic environment might alter the templates for enzyme formation within the cell

In developing his theme, Dr Willmer seems at first to be 'Lamarckian' rather than 'Darwinian' in his outlook He instances the fact that "many animals independently under Arctic conditions cease to produce melanin in their skins, and so all become white", and evidently considers this to be an adaptation to the iciness of their environment instead of natural selection How else can one construe the observation on the same page (227) that "when phenyl-alanine is added to tissue cultures of even the ventral ectoderm, the cells of which would never normally produce melanin, some of these cells can actually be induced to do so"? Perhaps it is only a lapse in analogy, for clearly the author favours natural selection when he later describes the disadvantages of "poor form-vision under critical conditions of hunting or being hunted"

In discussing the development of the kidneys, gonads, adrenal cortex, and other cell populations closely related to them, he envisages their origin from the cœlomoducts and the nephridia of the more primitive invertebrates This last third of the book is a mine of valuable information hidden in catacombs of unresolved definition and delineation When, for example, at page 274, the reader finds that the nephron of kidney tissue would best be described as "some sort of nephromixium", he later has to try to understand why the spermatic tubules and their mesonephric elements should be described as a "mixonephridium".

Appropriately the book ends on the subject of light and evolution of vision, and the final chapter is an illuminating summary of the author's concepts of evolutionary cytology Here, Dr Willmer states concisely the principles on which he bases his view about the evolution of cell types and embryogenesis As a cytologist he treats cell structure with reverence and appears to be horrified by the butchery involved in the biochemical analysis of sub-cellular fractions Nevertheless, the book concludes that there is an exciting 'jungle pathway' ahead for microbiochemistry and cellular physiology. Dr Willmer has done a great service by creating a new and well-indexed route through the jungle of cytological embryology.

I Leslie

A SURVEY OF EXTRA-SENSORY PERCEPTION

The Hidden Springs

An Enquiry into Extra-Sensory Perception By Renée Haynes. Pp. 264+9 plates (London Hollis and Carter, Ltd , 1961) 30*s* net

ALTHOUGH this book is said on the title-page to be an inquiry into extra-sensory perception, it is much more a descriptive historical summary than an inquiry Miss Haynes, writing from the point of view of a Roman Catholic, traces the belief in extra-sensory perception from early times, showing how the faculty was believed to exist and how it was described and became a part of various theological and philosophical systems Passing from the supposed appearance of extra-sensory perception in animals, insects, etc., Miss Haynes proceeds to describe its occurrence and treatment among people in ancient, medieval and modern times, and traces the story from the days of the Roman Augurs to the late Prof Jung's theory of synchronicity.

This book, like others on the same subject recently published, illustrates a trend in psychical research which is becoming increasingly apparent Although there have been some trenchant criticisms of some of the more famous and supposedly 'water-tight' experiments, the tendency is to ignore and belittle such work and to proclaim that extra-sensory perception is now an established fact, and that, as Miss Haynes puts it, resistance to the idea springs from dread of the acute intellectual discomfort involved in recognizing its implications, a feeling which would be new to many scientific men What the author fails to realize is that the resistance in the mind of the well-informed reader is engendered by precisely the kind of book that she has written Thus when she speaks of certain early experiments where the methods of the 'exact sciences' were used to organize the tests and evaluate the results, it can scarcely be thought that she can be ignorant of the nature of these tests and of the damaging criticisms levelled against them Nevertheless, if the book is to be read as a popular and well-written historical introduction to the subject, it will serve at least one of its main purposes, since it provides the reader with a clear sketch of the development of the study of extra-sensory perception accompanied by a series of interesting religious and philosophical speculations

The book is well produced and indexed and would have been improved had the author taken a little more care with her proper names and a good deal more caution in the treatment of some of her material

E J Dingwall

EFFECTS OF CLIMATE ON VEGETATION

Klimadiagramm-Weltatlas

Von Prof Heinrich Walter und Dr Helmut Lieth 1 Lieferung Mit einer Deutschen Einleitung und Auszugen in Englischer, Franzosischer, Russischer und Spanischer Sprache 11 Karten und 65 Beiblattern (Jena Gustav Fischer Verlag, 1960) 120 D M

GERMAN work on the relationship between climate and vegetation is of long standing, stemming from the celebrated work of Humboldt ; and our ideas with regard to the classification of climates owe much to Koppen One turns accordingly with keen expectation to the first section of this newly produced and bulky atlas

Prof H Walter, as director of the Botanical Institute of the Landwirtschaftlichen Hochschule at Stuttgart-Hohenheim, with his assistant Dr H Lieth, has embarked on the mapping of all the meteorological stations for which information is accessible, and on the presentation for each station of 'climate graphs' to illustrate the extent of characteristic types of climate This is to fulfil the need to compare the climates of different regions in which the vegetation is very similar They quote as an example a recent inquiry as to where a climate corresponding to that of the central Anatolian steppe might be found in the United States, or in Central Asia, moreover, regions with similar types of vegetation offer the same possibilities for land utilization, for example, in agriculture or forestry An explanatory introduction is given in four languages , it is hoped that the diagrams will also yield a basis for a more accurate classification of climates

This characteristic aim is supported by the admirably clear printing of a very large number of station diagrams showing the annual march of the monthly means of temperature and precipitation , indeed, an elaboration of the familiar diagrams of present-day school atlases Vertical scales are so chosen that 10° C corresponds to a precipitation of 20 mm This is said to derive from a paper by Gaussen, which demonstrates that in the Mediterranean region aridity can be said to prevail when on such a scale the precipitation curve falls below the temperature curve, and vice versa Additional information with regard to excessive rainfall, the length of the frost-free season and severity of winter frost is provided ; and Prof Walter also introduces his concept of the limit between forest-steppes and woody regions

This first selection of maps and diagrams gives a pleasant impression of useful and orderly compilation; one can run one's eye along scores of 'climatic graphs' with interest But many will dispute whether, in the light of our knowledge of evaporation-losses, humid and arid months can be distinguished over a wide range of latitudes on such a very simplified basis Such detailed mapping of climatic regions also begs the question of purpose; is it in order to tell American troops at what point they must put their boots on ? Some of the subdivisions are quite fascinating; that an outlier of the maritime climate of North France appears to be found at Cologne raises the interesting question of where the observations are kept It is curious to find no use made of the long-standing record at Stanley in the Falkland Islands This atlas seems in these days to be a little old-fashioned , it makes a very fine compilation of information and the pictorial presentation has its advantages , but it is decidedly expensive and bulky for the more general reader, and lacks the detail for which some specialists will probably ask

G Manley

HISTOLOGY AND ELECTRON MICROSCOPY

Histological Techniques for Electron Microscopy

By Daniel C Pease Pp xii+274 (New York Academic Press, Inc , London Academic Press, Inc (London), Ltd , 1960) 7 50 dollars

IN spite of the extensive use of the electron microscope in biological and medical research in the past decade, there has been a complete lack of a comprehensive guide to techniques since Drummond edited *The Practice of Electron Microscopy* in 1950 Presumably all the leading exponents of the subject have been too busy cutting ever thinner and thinner sections in the exciting exploration of the ultrastructure of tissues and micro-organisms Certainly there has been no lack of publication in the way of original papers , but for one reason or another no general survey of methods has been compiled One of the pioneers of ultra-microtomy has now remedied the situation The text under review starts from the proposition that a novice should be able "to gain reasonable competence through his own ingenuity if he has a guidebook to help with the maze of detail" This function the author proceeds to fulfil in the course of nine chapters and two appendixes After general advice on the organization and management of an electron microscopical laboratory, the fixation, embedding and sectioning of tissues are discussed in great detail The mounting of sections and their examination in the microscope are then considered, and a further chapter is devoted to photographic techniques The final chapter describes preparation procedures other than sectioning, including shadow-casting and replica making The appendixes give useful guidance to the beginner about the literature of the subject and available sources of equipment and materials

The treatment is clear and thorough, being illustrated with photographs of various operations, as well as with typical micrographs The author is at pains to describe many "seemingly small, but actually critical details" of preparation This is a praiseworthy aim, but it opens the way to dogmatism and the glossing over of differences of opinion between rival schools of thought However, the author is usually frank in stating where his own experience has been limited, and he also provides a list of references at the end of each chapter, so that the novice can seek alternative advice In the almost complete absence of regular courses of instruction in the techniques of electron microscopy, the present text provides as comprehensive a handbook as can be expected from a single pen It is designed to be used at the bench rather than in the library, and should be beside every electron microscope in use in a biological or medical laboratory

RADIATION PROTECTION

Radiation Protection and Recovery

Edited by Alexander Hollaender (International Series of Monographs on Pure and Applied Biology Division Modern Trends in Physiological Sciences, Vol 7) Pp v+392 (London and New York. Pergamon Press, 1960) 70*s* net

Problems of Infection, Immunity and Allergy in Acute Radiation Diseases

By N N. Klemparskaya, O G Alekseyeva, R V Petrov and V F Sosova Translated from the Russian by Lydia Venters Translation edited by R Clarke. Pp viii+165 (London and New York Pergamon Press, 1961) 50*s*

The Delayed Effects of Whole-Body Radiation

A Symposium Edited by Bernard B Watson (Jointly sponsored by the Operations Research Office and the Walter Reed Army Institute of Research) Pp ix+80. (Baltimore, Md The Johns Hopkins Press, London Oxford University Press, 1960) 36*s* net

The Entry of Fission Products into Food Chains

Edited by J F Loutit and R Scott Russell (Progress in Nuclear Energy Series 6 Biological Sciences, Vol 3) Pp vii+154+xii (London and New York Pergamon Press, 1961) 45*s* net

Radioactivity for Pharmaceutical and Allied Research Laboratories

Edited by Abraham Edelmann (A Symposium sponsored by Nuclear Sciences and Engineering Corporation, held in Uniontown, Pennsylvania) Pp xii+171. (New York. Academic Press, Inc, London Academic Press, Inc (London), Ltd. 1960) 6 dollars

CURRENT and forthcoming legislation, in the form of Factories Acts such as the "Ionising Radiations (Sealed Sources) Regulations 1961", and its companion dealing with the use of unsealed radioactive substances in industry, require the appointment of a medical officer, who will carry out examinations on those workers exposed to radioactive materials Much of this work will fall on the industrial medical officer already connected with the firm, or the local medical officer of health, but it will be extremely unusual to find one with any knowledge on the effects of radiation It is true that a set of notes (*Medical Supervision in Radiation Work*) has been drawn up by the World Health Organization, but the keen medical officer will generally wish to supplement this knowledge with information on the effects of relatively high doses or chronic exposure to relatively low doses of radiation

The subject is, however, still in its infancy, and much of the information is contained only in professional journals or proceedings of learned societies. The production of any text-book on the subject is therefore of considerable interest at the present time, though from this point of view the books under review are rather too specialized for the average medical officer On the other hand, there is much to be learned from them, even by the non-specialized reader, and while the first three are primarily medical in character, the health physicist can also find much to interest him here

All five books are the products of a team of authors, each a specialist in some particular part of the field

Probably the most important is *Radiation Protection and Recovery* This is not a comprehensive text-book, rightly concentrating on biological, physiological and biochemical methods of protection and leaving discussion of shielding, etc, to physicists Its stated aim is to present some of the background of a rapidly developing subject, and in this it succeeds. A considerable amount of space is devoted to experimental treatment of acute whole-body radiation injury in mammals and to the allied problem of antibody formation, which is of great importance in connexion with bone-marrow implantation

A remarkably extensive bibliography of some 1,500 references is included; this alone should make the book a valuable source of information in this field

The second book is a translation, sponsored by the U S Atomic Energy Commission, of a monograph published in Moscow in 1958 and is probably not, therefore, fully representative of current thought in the Soviet Union It deals exclusively with the results of animal experiments on auto-infection following irradiation, natural and induced immunization, allergic reactivity, and infectious diseases in radiation sickness, again there is an extensive bibliography, about half the 326 references being non-Russian in origin.

From the research worker's point of view, *The Delayed Effects of Whole-body Radiation* will be disappointing, though for those generally concerned with radiation protection there is some interesting material Effects on life-span, the induction of malignant diseases and the production of cataracts are each covered in two chapters, one on animals and the other on man, genetic aspects are treated jointly

The Entry of Fission Products into Food Chains is not directly comparable with the previous three books, but it is justifiable to include it in this review since the subject is so closely connected with radiation protection As one might expect of the editors, who are authorities in this field, we have here a most informative group of papers, which were originally produced as reports by the Atomic Weapons Research Establishment There are two sections on the retention of fall-out on herbage and ripe cereals, but the majority of the papers deal with animal experiments connected with actual nuclear weapon tests. This is definitely a specialist's book, but should also be of great interest to anyone concerned with the wider aspects of radiation protection and civil defence

The last book is unfortunately titled It is certainly not a text-book for pharmaceutical laboratories, being simply the proceedings of a symposium, it is very mixed in character and is too varied in standard to be of great interest

Hugh D Evans

Structural Concrete

By Prof Kurt Billig Pp xx+1020 (London. Macmillan and Co , Ltd , New York St. Martin's Press, Inc , 1960) 84*s*. net

PROF. BILLIG is a well-known author of books and papers on reinforced concrete and prestressed concrete His present volume aims to provide a "minor encyclopædia on structural concrete", and this is indeed a fair description of the work. It is divided into three sections, the first dealing with materials, the second with structural design and the third with design and construction. In attempting to cover such a wide field in a single volume of manageable size the author is inevitably faced with very difficult problems of selection and condensation On the whole, Prof Billig has tackled these problems successfully although the depth of treatment varies somewhat from one chapter to another

Part 1 is devoted mainly to concrete technology, that is to a discussion of the properties, selection and testing of cements and aggregates and the techniques of mixing, placing and consolidating concrete A chapter is devoted to the important question of durability Part 2 considers first the basis of structural design in concrete and goes on to discuss in considerable detail the methods of proportioning practically every kind of structural element in reinforced concrete, including beams, columns, slabs, arches and shells A great amount of ground is covered, and numerous diagrams, tables and examples are included The third section of the book discusses the use of structural concrete for a wide variety of building and engineering structures, with reference to actual examples

A very good balance has been achieved between structural analysis, practical design considerations and concrete practice The book is a veritable mine of information for structural engineers and architects, to whom it can be highly recommended

A W HENDRY

An Electronic Outline of Organic Chemistry

By Dr. S Horwood Tucker Pp xvi+478 (London · University of London Press, Ltd , 1959.) 63*s* net

THIS is a book, written for undergraduates, in which the reactions of the commoner types of organic compounds are interpreted in terms of the electronic theory Dr. Tucker is to be congratulated for having rescued so effectively the "gems of electronic exposition" from submergence in the "heavy matrix of comprehensive fact". Not that the importance of experimental fact is in any way diminished indeed, just sufficient significant facts have been carefully selected and lucidly expounded to present to the undergraduate a clear and reasonable account of the essentials of organic chemical theory

There are, however, certain omissions which, though they do not detract from the overall value of the book, nevertheless seem surprising, especially since these topics are now included in undergraduate lecture courses Thus, the reactions of benzyne, and of carbenes (even in connexion with the Reimer–Tiemann reaction, p 407) are neglected ; likewise Bender's work on ester hydrolysis receives no mention

The text is well supplied with references to both individual papers and review articles

It is a pity that several misprints remained undetected in the proofs Fortunately, most of them are relatively trivial and they do not seriously affect the sense of the text

The book is well produced and possesses a good index.

While this book can be strongly recommended to students, it is likely that its price will deter all but the most affluent, or the most self-denying of the impecunious, from purchasing it. NEVILLE H. P SMITH

Proceedings of the 1960 Annual International Conference on High Energy Physics at Rochester

N.Y., August 25–September 1, 1960. Edited by E C G Sudarshan, J H Tinlot, and A. C. Melissinos Pp. xxv+890 (Rochester, N Y University of Rochester, 1960 Distributed by Interscience Publishers, Inc , New York and London) 13 50 dollars

THE International Conference on High Energy Physics which was held in Rochester, N.Y , was the tenth in the series This annual conference is acknowledged to be the most important one in this field Its purpose is to assemble a representative group of workers from high-energy laboratories throughout the world to discuss the experimental results obtained and the theoretical developments which have occurred during the previous year

The *Proceedings* are divided into three sections The first section covers the initial "working" or "S" sessions, several of which were usually held concurrently The second, "R" section, contains the reports of the *rapporteurs* Finally, in the last three chapters are contained, in full, the papers presented at three "plenary" sessions The subject-matter of the conference was limited to the following topics the strong interactions of pions and nucleons ; the strong interactions of strange particles , weak interactions ; the structure of elementary particles , new results at super-high energies, and finally, theories of elementary particles

The editors, secretaries and all concerned with the publication of the *Proceedings* deserve the highest praise for producing such a magnificent record within two months of the end of the Conference No physicist interested in elementary particle physics can afford to be without the volume close at hand

G H STAFFORD

Probability Theory

By Prof. Michel Loève Second edition (The University Series in Higher Mathematics) Pp. xvi+685. (Princeton, N J D Van Nostrand Company, Inc , London · D Van Nostrand Company, Ltd , 1960) 111*s*

THE first edition of this book appeared in 1955 and went a long way to fill a serious gap in the mathematical literature The new edition, revised in detail and longer by two chapters, comes a little nearer to closing the gap and is still the only (and an excellent) approximation to a comprehensive textbook on mathematical probability. The new chapter 11 (64 pages) deals with the generalities of the theory of stochastic processes (including separability and measurability), continuous-parameter martingales, and decomposability theorems The new chapter 12 (95 pages) deals with Markov processes It starts with an account of the 'strong' Markov property, and passes on to a discussion of the differentiability of transition functions before taking up the theory of one-parameter semi-groups of operators, which it pursues as far as a proof of the basic Hille–Yosida theorem Finally, there is a valuable synthesis of the recent work by Feller, Dynkin and others on diffusion theory. D G. KENDALL

PROF. A. J. EAMES AND THE MORPHOLOGY OF THE ANGIOSPERMS

By Prof F. C. STEWARD, F.R S
Cornell University

By a happy combination of circumstances, the McGraw Hill Publications in the Botanical Sciences have issued *Morphology of the Angiosperms*, by emeritus professor of botany, Arthur J Eames, in the author's eightieth year* It is therefore fitting that botanists should congratulate Prof Eames on October 10, his eightieth birthday, on an active and fruitful life devoted to the study of plants and to the teaching of botany His latest book, which is a crowning achievement in an already distinguished career, is also a proper subject for congratulation

For almost fifty years (since 1912) Prof Eames has been identified with botany at Cornell University He joined the staff of that University, fresh from his first travels to Australia and New Zealand, and, when botany was transferred wholly from the College of Arts and Sciences to the College of Agriculture in 1913, Prof Eames formed one of that group which was to make the newly constituted Cornell Botany Department known and respected the world over by the mid-1920's and '30's Now, in his eightieth year, Prof Eames is the only one of that first group who is still actively engaged in botanical research on the Cornell campus Throughout that near half-century, his presence has lent distinction to Cornell botany, and his work has enriched the subject everywhere This distinction was recognized by the University of Glasgow in 1956 by the award of an honorary LL D degree

Although Prof. Eames retired from active teaching in 1949, he has led a full life since, and the title 'emeritus professor' has been to him a challenge and an opportunity to pursue further scholarly work, of which the *Morphology of the Angiosperms* is a product Never was the title 'emeritus professor' more richly deserved, nor more gracefully borne, for throughout this period of retirement he has set an example of continued dedication to his lifelong study of plants He has also been ever ready to share his knowledge, whether in the casual conference or the country walks in which his love of Nature excels These brief congratulations would, however, be incomplete—and even inappropriate—without reference to Mrs Eames, who was herself technically trained in botany and has been a great help to Prof Eames throughout, and especially so in the laborious task of producing this latest book

It is appropriate at this point to look back on Prof Eames's career and on his influence on teaching and research in botany Together with the late Prof. Wiegand, he produced the *Flora of the Cayuga Lake Basin*—in the obvious desire to know first the plants which were closest at hand Indeed, many of the early collections which formed the basis of the present Wiegand herbarium were a part of this relationship Although morphology has always been his consuming interest, Prof Eames first became most widely known for the *Introduction to Plant Anatomy*, first published in 1925 and revised in 1947 This book, compiled with his first graduate student, Prof. McDaniels (also now an emeritus professor) was, and in many places still is, the essential modern text on which successive generations of botanical students have become aware of plant anatomy Those who, in the 1920's and 1930's, were privileged to take Eames's course in plant anatomy know that much of the wealth of illustrative material in the form of prepared slides and sections had actually been produced by Eames and McDaniels It was a rich experience for the student to see not merely a stem, or one example of this or that anatomical feature or tissue, but a rich array of representative examples In this, as indeed in the study of morphology, Prof Eames's outlook was always comprehensive Even then, however, the book on anatomy was essentially the background, or working manual, for it had distilled the essence of Eames's experience of anatomy, and his lectures clothed this framework with much more that had been gained from a rich observational experience Yet, with this far-ranging interest to comprehend the plant kingdom as a whole, Prof Eames has in all his books shown that rare ability to state the essentials, to distil it down to its minimum, so that often a paragraph presupposes the equivalent of a research investigation before it could be written

The new *Morphology of the Angiosperms* is again in this style, though necessarily it is a larger work than its predecessor on the *Morphology of Lower Vascular Plants*, which was published in 1936 The new book comprises 518 pages, 147 well-chosen figures, with often several pages of selected references at the end of each chapter The *Morphology of the Angiosperms* is again remarkable for its concise style and for the way its author has been able to compress the knowledge gained from the literature and his own experience. Again one senses that, over the years in which this volume has been prepared, Prof. Eames had conducted the equivalent of many research projects, each worthy of separate review, on subject-matter which in the book is concisely treated

Prof Eames's first book on morphology dealt with the lower vascular plants In respose to an evident need, however, the new work deals with the angiosperms—the largest in number, most complex and most important vascular plants. One wonders whether, and even hopes that, Prof Eames will now fill the gap and enrich botanical science by yet another work on the gymnosperms.

Characteristically, Prof Eames does not in his introduction enlarge on what morphology is, and in these days of ever-narrowing specialization—of plant physiology and biochemistry, of cytology and genetics, of cell physiology, cytochemistry and ultrastructure, of enzymology and molecular biology—some may even ask, what is it all about?

The book is simply and completely about angiosperms—the largest modern group of seed plants and morphology here implies strictly that the work deals with the structure and the form of these plants The work distils from the literature and from Prof.

---

* *Morphology of the Angiosperms* By Prof Arthur J Eames. (McGraw-Hill Publications in the Botanical Sciences) Pp xiii + 518 (New York McGraw-Hill Book Co , Inc , London McGraw-Hill Publishing Co , Ltd., 1961) 104*s* 6*d*

Eames's own rich experience what one can interpret about angiosperms from what one observes of them, and observation here means visual observation, aided by the lens and the optical microscope Among the allied disciplines that are invoked to interpret angiosperms from this point of view, physiology, biochemistry, genetics, ultra- and sub-microscopic structure as yet find no place Prof Eames looks at plants as they are, as he sees them, and by an essentially comparative approach seeks information which is to be interpreted against the background of evolution and phylogeny In this sense the book follows a classical tradition

But it is precisely because so much modern biology and botany has become so dissected into specialties that this comprehensive work is now so valuable Indeed, it should be especially valued even by those students of plants whose interests lead them to experimentation, to culturing organs and cells, to the study of biochemistry and nutrition, and to the approach to truth at the molecular level A generation which is steeped in this sort of thing has rarely had the time, even if it had the interest, to acquire the breadth of knowledge and scholarship about plants that Prof Eames's book now contains Even a glance at the table of contents, for the headings and sub-headings of the chapters, may be a salutary reminder to some that although biological events may often be determined at the cellular and subcellular level, they finally culminate in organization that needs to be comprehended at much higher levels Those of us who attempt to exploit the new tools of physiology, biochemistry and ultra-structure need particularly to appreciate the nature and the relationships of the cells and organs with which we work

Here then is a modern work which synthesizes knowledge in a comparative way about such parts of the plant body as shoots and roots, leaves and stipules, nodes and branches, the inflorescence and the flower, the androecium, the stamens and pollen, the gynoecium, carpel and ovule, sporogenesis, fertilization, embryology, seeds and fruits, etc , and, in the course of this treatment, it introduces the reader succinctly to classical morphological concepts and to the author's contemporary views But it is in the chapters on the stamen and the carpel and their derivation from foliar organs that Prof Eames's personal interest and interpretations are particularly evident

Inevitably this work, which could not possibly be summarized here, will find a sure place among the botanical classics, and it will necessarily be read by those who make morphology their speciality But this book should do more than this, for it should be a ready means to guide those who work experimentally with angiosperms, and especially those concerned with problems of growth and reproduction, into the proper interpretation of the nature of the material with which they deal There is a dangerous and mistaken idea abroad that biology has outgrown the older descriptive disciplines of morphology, anatomy and taxonomy Prof Eames's book should dispel this idea by bringing a fresh presentation of this older subject In fact one notes, parenthetically, that Prof Eames finds that the older literature is often nearer the truth than much which has been written more recently

A less-modest man than Prof Arthur J Eames might, in his eightieth year, have titled his book "The Angiosperms as I see them", for he is one of the very few who have had the experience and have the knowledge, the vision and the understanding for this great task

Botanists everywhere will feel indebted to him for this additional achievement in a long and fruitful career

RE-EVALUATION OF SOME FACTORS IN ARTERIOSCLEROSIS

By Dr HANS KAUNITZ

Department of Pathology, and Institute of Comparative Medicine, College of Physicians and Surgeons, Columbia University, New York

MORPHOLOGICALLY, arteriosclerosis is defined as a disease of the intimal layers of the arterial wall occurring focally and associated with intimal thickening and lipid deposition The earliest changes can be seen in infants The internal elastic membrane becomes deformed, calcified, and fibrotic These foci are eventually called atheromata Disturbances of the flow of blood may ensue Frequent sites of these changes are, in addition to the aorta, the coronary, cerebral, and lower leg arteries Any theory of the disease will have to account for these facts at least

Thickened arteries (παχειη αρτεριη) were noted nearly two thousand years ago by Aretaeus of Cappadocia The term artheromatous (or tuberculous) was used by Morgagni[1] and perhaps even by others before him, but modern ideas about the disease were developed by the great French physicians of the Napoleonic era Lobstein[2] classified the disease as a nosological entity between 1820 and 1833 and was the first to use the name arteriosclerosis He had the first inkling that the disease may be related to cerebral accidents The relation of myocardial infarction to arteriosclerosis was established much later After the great English physicians of the eighteenth century had recognized the association of coronary disease and angina pectoris, it took another century to establish that this coronary disease is arteriosclerosis

Soon after Lobstein's description, two theories as to the pathogenesis of the disease were developed which still dominate our thinking Rokitansky thought that abnormal clotting processes, resulting secondarily in the organization of thrombi, were responsible for the arterial roughness[3] Virchow assumed that, in what he called endarteritis chronica deformans[4], focal inflammatory changes are followed by deposition of lipids such as cholesterol, which had just been discovered Virchow may have been somewhat handicapped by his inability to distinguish arteriosclerosis from other arterial diseases, such as syphilitic aortitis, which became possible only at the end of the nineteeth century

In addition to syphilitic aortitis, other arterial diseases involving calcification were recognized, particularly media necrosis[5] Whether or not the latter is at all related to arteriosclerosis is by no means sure For purposes of definition it should, at the present time, be excluded This would make unnecessary the use of such terms as atherosclerosis, angiosclerosis, and the like

At about the turn of the century, it was discovered that early arteriosclerotic lesions occur in children[6], and this observation has since been extended to infants[7] However, at the same time, the rapid progress of biochemistry and nutrition began to influence the work on arteriosclerosis[8], so that, since then, most investigations have centred around the disturbances of lipid metabolism and their association with dietary fat It is curious how little attention has been paid to the early occurrence of the lesions

By the end of the nineteenth century, it had been well established that arteriosclerosis, in common with other systemic diseases, is subject to modifications by a number of general factors

The disease runs in families, and probably has a genetic factor Sex plays a part in that women below the age of fifty have fewer heart attacks than men Physical activity is also a factor because people with sedentary work show extensive lesions more frequently than people doing manual work Arterial hypertension is associated with more advanced lesions Arteriosclerosis occurs more extensively in old persons The abuse of coffee and tobacco leads to more frequent myocardial infarctions, whereas the incidence in heavy drinkers is relatively low The stress that those in managerial positions are subjected to has been cited, although not completely convincingly, as contributing to a high incidence among this group

The accummulation of fatty substances in the atheroma suggested examination of lipid metabolism At about the turn of the century, it was found that patients afflicted with advanced arteriosclerosis have lipæmic sera[9], and it was soon established that the serum cholesterol is frequently elevated[10] Further work elucidated other disturbances of lipid metabolism in arteriosclerosis Important is the elevation of the β-lipoprotein fraction of the serum[11] , it contains most of the cholesterol, two-thirds of which is esterified with oleic and linoleic acids[12] Finally, it was discovered that, in advanced arteriosclerosis, the saturated and oleic acid-levels of the serum are often elevated, whereas the polyunsaturated levels are lower than normal

When these lipid disturbances were first examined investigators considered them as the consequence rather than the cause of the lesion , and it is certainly true that many chronic diseases are accompanied by similar lipid changes However, since the fateful experiments with cholesterol feeding, which were interpreted as proof that cholesterol produces arteriosclerosis in animals[13], many leading investigators have been inclined, during the past fifty years, to accept disturbances of lipid metabolism as etiological factors in arteriosclerosis

If one were to summarize the evidence implicating cholesterol (or perhaps the β-lipoprotein fraction), one might choose these animal experiments involving the feeding of large amounts of cholesterol or the induction of an abnormal rise in serum cholesterol , its presence in large amounts in the atheroma ; higher serum cholesterol-levels in diseases predisposing people to arteriosclerosis (hypothyroidism, nephrosis, familial hypercholesterolæmia) , and the fact that its increase in arteriosclerosis patients permits some degree of predictability as to the state of the disease

With regard to animal experiments, it has frequently been pointed out that the high cholesterol diets which induce lesions having a high cholesterol content are entirely unphysiological One finds that cholesterol is deposited in most organs[14] , but it is usually the blood vessels which are singled out for discussion It has been argued by some pathologists that the morphology of the lesions bears little resemblance to arteriosclerosis[15] and that the disease scarcely ever gives rise to myocardial infarctions. A number of experiments has been described in which arterial disease associated with cholesterol deposits has been produced on cholesterol-free diets[16], whereas, in others, the serum cholesterol-level was raised to ten times its normal value without producing arterial lesions Therefore, at the present time it does not seem that the lesions induced in animals by cholesterol feeding are analogous to human arteriosclerosis

In a discussion of the presence of cholesterol in the lesions, it is well to recall some general facts about cholesterol metabolism All organs, and especially the liver, produce much more cholesterol than a human being would eat in any reasonable diet, and feeding of as much as 10 gm of crystalline cholesterol (compared with about 500 mgm in a normal diet) does not influence the serum cholesterol-level in humans (it does in animals) Of the total cholesterol produced by the body, about 2 per cent is known to be used in the synthesis of steroid hormones The function of the rest is largely unknown One may speculate that, under normal conditions, it forms a building material for all cells[17] , and this guess is supported by its role in disease As I have stated before, disturbances of lipid metabolism like those in arteriosclerosis occur in many chronic diseases In tuberculosis, for example, the onset of the disease is followed by hypercholesterolæmia and the deposition of large amounts of cholesterol in the tubercle, which, in the lungs, may afford some protection against cavitation These changes in cholesterol metabolism can be considered as a defence mechanism of the body Similar mechanisms are seen in many other chronic diseases, (nephrotic kidneys, thyroid tumours, uterine fibroids, old scars) Sometimes, the inflammatory process leads to such an accummulation of cholesterol that the repair process becomes a danger, as with gall stones and kidney stones or when cholesterol crystals break off an arteriosclerotic lesion and produce an embolism[18] If one assumes that the pathology of cholesterol metabolism in arteriosclerosis is similar to that in other chronic diseases, one could interpret the presence of cholesterol in the lesions as a process of repair

Such a hypothesis could also explain the premature arteriosclerosis associated with chronic diseases such as nephrosis and hypothyroidism These conditions are associated with generalized tissue damage which, in turn, evokes a generalized repair process, as in severe rheumatic conditions or in syphilis , this repair process may involve the arterial lesions which are present in all of us to some extent from infancy Thus, one may also understand the predictive value of elevated serum cholesterol-levels in arteriosclerosis and even of the apparently anomalous low levels seen in some advanced cases[19] Furthermore, one may speculate that therapeutic reduction of serum cholesterol may have its disadvantages unless one is sure that the lower level in serum does not reflect some damage to the animal This is not such a remote possibility in view of the fact that feeding of oxidized fats which are toxic leads to a reduction in serum cholesterol[20].

Because arteriosclerosis, in Western countries, is now the main cause of death, investigation of life expectancy can in a general way be interpreted as work on arteriosclerosis. The fact that obese people have a shorter life expectancy needs no elaboration. Careful autopsy studies immediately after the lean years of the two World Wars in Vienna and Norway respectively showed a remarkable decrease in the incidence and severity of arteriosclerosis, which manifested itself in fewer strokes and heart attacks[21]. There was a rapid increase as soon as the food intake returned to normal. This is at the bottom of all speculations about the relation of diet to arteriosclerosis.

Dietary fats have been given tremendous importance in the consideration of arteriosclerosis. They exert a two-fold influence. Unspecifically, they are the densest source of calories and their feeding reduces energy requirements which increases body-weight and arteriosclerosis. But more specifically, they wield a strong influence on serum cholesterol unrelated to their own cholesterol content. It has been claimed that the number of heart attacks is a function of the fat content of the diet, Japan, with a dietary fat-level of about 8 per cent, has the fewest, and the United States, with 40 per cent of fat in the diet, heads the list. The incidence among Japanese living in California and eating the same diet as the rest of the population is the same as for the rest of the United States[22].

This hypothesis has not remained uncontested. It has been pointed out that the incidence of strokes in Japan is higher than in the United States and that arteriosclerosis is less of a problem in Thailand than in Japan despite a much higher dietary fat-level[23]. Similarly, it has been claimed that there is no difference in the incidence of arteriosclerosis in London and Calcutta despite widely differing diets[24]. Furthermore, it has been shown that, among those countries having a daily fat intake of about 120 gm., the rate of myocardial infarction is four times as high in the United States as in the Netherlands[25]. In general, however, there is fair agreement that a very low fat intake, especially in association with a low total caloric intake, leads to fewer myocardial infarctions. With regard to strokes, it is difficult to evaluate the data.

Human life-time studies do not exist, and animal experiments are sparse and contradictory with regard to the level and kind of fat eaten. Therefore, the main argument as to the advisability of eating specific fats rests on their influence on serum cholesterol, and possibly also on blood coagulation. From the point of view of the tenuous hypothesis that serum cholesterol-levels may reflect the extent of tissue damage and in view of the over-all predictive value of these levels, the question of whether manipulation of serum-levels by fat is meaningful is of interest, but ardent public discussion is, at best, premature. Much has been made of animal versus vegetable fats[26,27], saturation versus unsaturation[28], and linoleic acid deficiency[29]. The fact that the saturated long-chain fraction of coconut oil increases and the saturated medium chain fraction decreases serum cholesterol-levels[30,31] is one of the many examples that no generalization can be made and that fats have to be considered individually. Only the theory that liquid fats have some advantages over hard ones has received some experimental support.

The discovery of heparin and the 'spoiled sweet clover disease' opened the way for an important advance in the treatment of arteriosclerosis. Based on Rokitansky's hypothesis as to the importance of thrombus formation, the newly developed anticoagulants have been used successfully in preventing many heart attacks and strokes. This approach was almost immediately influenced by prevailing ideas about the role of fat in arteriosclerosis, and a large number of papers has been written dealing with the question of whether the lipæmia occurring after the intake of fat increases the tendency of the blood to clot. Although, with respect to this, opinion is divided, most investigators agree that certain fats (especially butter) do have some effect on coagulation in that they shorten the Russell viper venom time. *In vivo* studies correlating changes in the clotting mechanism with those of the arterial wall may be of considerable interest[32] because the normal arterial wall produces enzymes which affect clotting, as in the clearing factor[33]. In the arteriosclerotic artery, the surface is more irregular, the lipid content is higher[34], the lipid breakdown products are different[35], and the atheromata themselves have a higher thromboplastic activity[36]. One should also keep in mind that the lipid composition of all organs is influenced by dietary fat, and this may in turn influence coagulation. In any event, the relation of fats to coagulation is still a wide-open field.

More recent work relating infectious processes to intra-arterial clotting may shed some light on arteriosclerosis. It is an old idea that infectious processes, by damaging the arterial wall, may be responsible for some of the changes seen in arteriosclerosis[37]. McKay has been able to produce intra-arterial platelet and fibrin deposits in pregnant rabbits by injecting endotoxins[38]. It is important that this process was observed when the organism was under the stress of pregnancy or when an endotoxin was injected together with substances of higher molecular weight[39]. It remains to be seen in which way these changes may be linked to arteriosclerosis.

The factors so far enumerated can modify the arteriosclerotic lesion, but are unspecific because they cannot account for the early occurrence of what is now believed to be the primary lesion in infants, neither can they account for the focal distribution of the lesions in the arterial system. These aspects of the disease invite the speculation that it may have a specific chronic infectious origin, as do leprosy, tuberculosis, and syphilis. Such a hypothesis could account for the early onset of the disease, for the focal distribution of the lesions, for the specificity of the organ attacked, for the eventual emergence of a histologically rather characteristic lesion from its early form, and even for the occasional disappearance of the lesion[40]. Furthermore, in view of the fact that the total population is affected by the disease at an early age, differences in the development of the lesions among members of the population would be accounted for by general factors such as heredity, nutrition, and the like. Something akin to this has actually happened in parts of the world where, at one time syphilis infected the whole population and where, before the infectious origin of the disease was known, the clinical manifestations were ascribed to factors similar to those implicated in arteriosclerosis. Even the rapid increase in the consequences of the disease in younger age-groups may be explained by the known increase of an unchecked infection if others are suppressed, as has happened in our lifetime Finally, such chronic infectious diseases as syphilis and tuberculosis have been with the human race for a long time, and their natural history was characterized by sudden epidemics Is it possible that we are witnessing such an outbreak of an old infectious disease ?

Whether or not arteriosclerosis, as it is defined to-day, will remain a nosological entity or will be seen as several diseases, or whether it will be recognized as an unspecific response (like fever) to a number of etiological factors, is uncertain Historically, the instrument of the physician of the nineteenth century was the microscope and of the twentieth century the paraphernalia of the biochemical laboratory Notions about arteriosclerosis were formed accordingly At the present time, virology and electron microscopy may enter the picture , it would be interesting to apply to these problems the methods used for the study of infectious nucleic acids[41] Again, our sense of the etiology may be influenced by the methods we use

Arteriosclerosis, being a part of the life process, can scarcely be pinned down to one etiological factor Any investigator will, according to his temperament and talent, pick out just those of the infinity of factors which he believes are important , and one would be satisfied to elucidate one facet which would permit us to influence decisively the course of the disease

MOVEMENT IN THE ATMOSPHERE

THE Royal Meteorological Society held its summer meeting this year in the University of Exeter during July 12–14, this included two symposia, on "Winds and Circulation in the Upper Atmosphere" and "Medium Range Diffusion in the Atmosphere"

Winds and Circulation in the Upper Atmosphere

At this symposium the upper atmosphere was regarded as extending from the tropopause (10–15 km) to the ionosphere (100 km) This region is one of great interest to meteorologists since it is situated between the outer layers of the atmosphere, which are under direct solar control, and the troposphere, where the weather occurs Due to indirect measurements and the more recent rocket investigations its general composition, temperature and wind structure are now fairly well known Broadly, the composition is not very different from that in the troposphere the temperature rises from 200–230° A near the tropopause to 260–300° A around 50 km , falls to 160–230° A near 80 km and then rises again at higher levels , the winds are mainly strong westerly in the winter hemisphere and easterly in the summer hemisphere Many measurements have been made of the distribution of ozone, water vapour and atomic debris in the lower stratosphere and these have been used to infer the meridional circulations Since electromagnetic forces, dissociation, excitation and ionization are still comparatively unimportant and mean free paths small, it is possible to apply the well-known meteorological equations used for the troposphere in the examination of its dynamics and interpretation of experimental observations

The first paper, "Possible Meridional Circulations in the Stratosphere and Mesosphere", by R J Murgatroyd and F Singleton, described a calculation of the meridional circulation sufficient to transport heat between the sources and sinks of radiation in a simple model of this region The sources and sinks have been estimated from differences of solar energy absorbed by ozone and molecular oxygen and that emitted by long-wave radiation from carbon dioxide, water vapour and ozone The principal sources are near the equatorial tropopause and in the mesosphere over the summer pole The corresponding sinks are near the polar tropopause and the winter pole in the mesosphere The calculation showed the air to be rising near, and possibly through, the equatorial tropopause, spreading polewards and sinking towards the polar tropopause In the mesosphere the air rises near the summer pole, flows across the equator and subsides near the winter pole This scheme is in good general agreement with many of the observed phenomena in this region, such as noctilucent clouds at high latitudes in the summer hemisphere near 80 km, comparatively high temperatures in the winter polar mesosphere, the 'sudden warming' phenomena, and the observed distributions of ozone, water vapour and atomic debris in the lower stratosphere

The second paper, "Winds at 80–100 km as revealed by Radar Reflexions from Meteor Trails", by J S Greenhow and E L Neufeld, contained the results of systematic work carried out at Jodrell Bank during 1953–58 The observation of drifts of ionized meteor trails using high-powered radio-echo equipment has produced upper wind data of a volume and accuracy unobtainable at other levels Regular prevailing winds with westerly components of about 20 m sec $^{-1}$ have been observed each year in summer and winter with easterly components in spring and autumn Large northerly components occur in summer and smaller southerly components in winter There is a semi-diurnal periodic wind of about 20 m sec $^{-1}$ which can usually be represented by a vector which rotates in a clockwise direction with constant amplitude every 24 hr Although large departures occur from this simple model, it provides good general confirmation of the resonance theory Measurements of the 24-hr and 8-hr periodic wind systems and also non-periodic (turbulent) components were also described and comparisons made with Australian data It is clear that with world-wide measurements of this type it will soon be possible to obtain a comprehensive picture of the atmospheric circulation at these levels The final paper, "Fluctuations in Tropical Stratospheric Winds", by R A Ebdon, described detailed analyses of winds and temperatures found by radio-sonde and radar wind methods between about 15 and 25 km near the equator The winds were shown to have had a 26-months periodicity in east–west direction during the past ten years The north–south components are usually small This effect appears to be world-wide, greater at the higher levels and near the equator but observable up to 1,000–1,500 miles from it When a change-over occurs, it starts at high levels and spreads downwards At present there is no explanation for this phenomenon and there are dynamical difficulties in explaining how west winds can occur at all extensively in equatorial regions

These three papers, which are being published in the *Quarterly Journal of the Royal Meteorological Society*, provoked considerable discussion Recently, there has been increasing evidence that the humidity mixing ratio in the stratosphere may increase from about 2×10^{-6} to 4×10^{-5} between 15 and 30 km, and this is difficult to explain unless there is a large extra-terrestrial source of water vapour, but this seems unlikely Recent measurements by the Meteorological Research Flight have shown values at 15 km around 2×10^{-6} at all latitudes (although no measurements have yet been made at high latitudes in winter), so that vertical upwards moisture transfer, except perhaps by some penetrative convection, is ruled out for most latitudes Other points needing clarification include the nature of the meridional transfer mechanisms, that is, the respective roles of the mean and eddy components on all scales The next steps in the advance of our knowledge of the dynamics of this region will be to take account of the angular momentum as well as the energy balance, and to formulate criteria for the onset of dynamic instability (which depends on lapse-rates and wind shears and will therefore be different at different levels) Turbulent transfer will be more important in the lower stratosphere and the region between 50 and 80 km than in the stable region between about 25 and 50 km, but the circulation here will of course also have to fit in with that for the region above and below it

Medium-scale Diffusion in the Atmosphere

The second symposium was concerned with the propagation and spread of particles in the atmosphere up to distances of 100 miles or more from the source This subject is of very wide application (since it involves all forms of atmospheric pollution including dust, radioactive materials, condensation and freezing nuclei and spores), and the study of concentrations at different points down-wind in different meteorological situations and their possible prediction is of great importance In the first paper, "Some Observed Properties of Medium-scale Diffusion in the Atmosphere", by F Pasquill, a series of experiments were described in which zinc–cadmium sulphide, a fluorescent pigment, was used as a tracer to investigate the horizontal spread of particles both in the cross-wind and along-wind directions The particles were discharged either from a maintained point source on the ground and sampled at different heights down-wind by an aircraft, or alternatively dispensed from an aircraft flying across the wind (which could be regarded as a continuous line source) and sampled down-wind by instruments carried on the cable of a captive balloon In each case it was possible to count under a microscope by using ultra-violet light the number of particles caught in unit volume at the different locations, and to relate them in terms of bearings and spread of the plume of particles to measurements of the strength of the source and the winds and other meteorological parameters

When diffusion occurs over considerable distances and height-ranges the systematic wind shear with height affects the cross-wind and along-wind dispersion of material spread out in depth, and this effect depends on the amount of vertical mixing (both mechanical and convective) The question arises as to whether at medium ranges the horizontal spread of the particles bears a consistent relation to the apparent horizontal field of turbulence, as it does in short-range diffusion, or whether there is a contribution which cannot be provided by this turbulence and is recognizably due to shear The analysis of the observations indicated that, when vertical mixing is present, the tendency for a cloud of particles to be sheared is strikingly removed, but when vertical mixing is inhibited, distortion of the cloud takes place, yielding horizontal displacements which would become effective on the revival of the mixing Due to this effect there is usually a diurnal cycle of vertical but not horizontal spread

The details of intermediate cases require further examination for a full quantitative understanding, although it is clear that turbulent spread, especially that due to the low-frequency components, always makes a large contribution apart from the shear There was also usually only a small variation with height of the direction and speed of travel of the particles compared with that of the wind In some cases, however, the mean direction was several degrees backed from the direction of the mean wind in the layer, and even from that of the surface wind, and was difficult to account for in terms of vertical momentum transfer

Dr J M Hirst then presented a paper on "The Long-range Travel of Fungus Spores" Plant diseases such as potato blight and black rust of wheat can be transmitted hundreds of miles due to the diffusion of spores in the atmosphere, and an examination of this mechanism is of considerable economic importance At the place of origin, the spore concentration may be as much as 1/c c and the concentration in the vertical is controlled by turbulence and atmospheric stability The decrease at inversions is usually rapid Furthermore, the presence of an immigrant as opposed to a locally produced spore can often be recognized by its different vertical distribution The concentration of the former tends to increase with height over the first few thousand feet and then decrease above, an effect which appears to be due to dry deposition during its relatively long period of travel The efficiency of raindrops as collectors of spores is high, so that spores are quickly removed from the atmosphere during rain Examples were shown of the measurement of the spread of spores of black rust of wheat from Europe to Britain The disease appears in early summer in southern Europe and slowly spreads northwards and is often observed in Britain by about August Samples obtained over the English Channel using the aircraft of the Meteorological Research Flight during periods of southerly winds had produced vertical profiles of spore concentrations which illustrated their travel in the atmosphere from Europe, whereas on other occasions it had been demonstrated by back-tracking air trajectories that they were not present in air of Atlantic origin reaching samplers on the ground Work of this type is continuing, and further experiments are now in hand to examine the diurnal variation of spore content at various heights and other characteristics of their diffusion in the atmosphere.

The final paper, "Mechanisms of Atmospheric Diffusion", by R S Scorer, was concerned with diffusion by turbulent eddies and by thermals In certain meteorological situations the latter are very important and may even be the dominant mechanism When diffusion of momentum occurs following any disturbance in the flow, there will be a loss of energy as the energy of shear is disorganized into smaller fluctuating motions, a process which may best be studied in terms of the vortex lines in the flow (Scorer, R S, *Natural Aerodynamics*, Pergamon Press, London, 1958) Momentum, however, is not always transferred at the same rate as heat or material, and in the case of thermals, $\frac{K_{\text{momentum}}}{K_{\text{material}}} = \frac{\sigma}{2}$, where σ is the fraction of the horizontal area occupied by the thermals and is usually 0 1–0 01 Hence thermals are about 20 times more efficient at transferring material than momentum, whereas in the case of mechanical stirring their rates of transfer are more equal As a consequence, the wind shear can be retained, and there can still be considerable transfer of material when thermals are operating

The ensuing discussion was principally concerned with the generation of thermals, which are intermittent and frequently confined to preferred areas, the relative importance of form drag and viscous drag and the necessity of considering eddies in three rather than in two dimensions As regards the practical aspects, it now appears that, observationally and empirically, at least the problem of determining the concentration of particles down-wind from a given source in given meteorological conditions is well understood and considerable progress has now been made.

R J Murgatroyd

UNIVERSITY EDUCATION IN GHANA

By Dr C T MORTIMER

University College of North Staffordshire, Keele, Staffordshire

THE report of the Commission on University Education in Ghana, and a statement by the Government on the report*, were published on July 5, 1961 Mr Kojo Botsio, a Minister of the Ghanaian Government, was the chairman of the Commission, which included American, British, Russian and Sierra-Leonean members The original terms of reference were "to advise on the future development of university education in Ghana, in connection with the proposal to transform the University College of Ghana, at Legon, and the Kumasi College of Technology into an independent University of Ghana" Afterwards, these terms were altered slightly, because the Government later proposed that the two institutions should be independent universities They are to be called the University of Ghana and the University of Science and Technology, Kumasi

In formulating their constitutional proposals for these two Universities, the Commission was guided by two main principles These are that the Universities should be able to respond to the immediate and future needs of the community, and that they should have the greatest possible autonomy in their organization, teaching and research The report deals first with the relationship between the Universities and the Government of Ghana The prevailing opinion was that new developments in higher education should be planned and financed at a national level by a single body, which would also co-ordinate and finance research programmes, both within and outside the Universities It was recommended that a National Council for Higher Education and Research be established Prof L A Bornholdt, of the University of Pennsylvania, did not support this recommendation "If such a body were to be created and were given full responsibility for planning research and for financing university education throughout Ghana, the Commission's recommendations for the autonomy and freedom of individual institutions would become no more than pious hopes " This minority opinion suggested a division of responsibilities and the creation of three bodies in place of the National Council a Joint Research Board, a

* Report of the Commission on University Education Pp 43 4*s* Statement by the Government on the Report of the Commission on University Education W P No 5/61 Pp 7 6*d* (Accra, Ghana Ministry of Information, London Crown Agents for Overseas Governments and Administration, 1961)

University Grants Committee, and a Research Grants Committee The Government has accepted the majority opinion and has created a National Council

Although the Commission made no specific recommendation, the Government has appointed *interim* University Councils, which have taken over the responsibilities of the College Councils until the governing bodies of the new Universities have been established The Government Statement notes that these *interim* Councils have been unable to offer appointments to five members of the existing academic staff The *interim* vice-chancellors and the Secretary of the National Council will be asked to report on recommendations of the Commission and those of committees which have been appointed by the President of Ghana Some of the functions of these committees were (1) to prepare proposals for the constitution of the National Council , (2) to draft constitutions for the new Universities , (3) to consider the supply of students , (4) to consult with College authorities on syllabuses

The Commission considered in some detail the type of university government which would best meet the needs of higher education in Ghana For the composition of the University Councils, the Commission suggested the following the Chancellor, the Vice-Chancellor, and one member appointed by the Council of the sister University Of the remaining members, one-third should be nominated by the Government, one-third by various educational bodies, and one-third should be selected by the University Senate from its membership Membership of the Senate would be broadly representative the head and two other teaching members of each Department, at least one of whom should be Ghanaian

In its statement, the Government endorses the views of the Commission on the steps which should be taken to accelerate the Africanization of University staff, in order that there will be a substantial majority of Ghanaians by 1967–70 The report notes that, at present, of a total academic staff of 201 at Kumasi and Legon, only 35 are Ghanaians Ghanaians who are of professorial calibre, working in departments which already have professors, should be appointed either as additional full professors or as associate professors When professorships fall vacant in departments in which there is no Ghanaian immediately qualified for appointment, distinguished scholars from other parts of the world might be brought in as visiting professors for periods of two or three years, while the departmental responsibilities would be entrusted to a Ghanaian lecturer The report stresses that efforts to increase the proportion of Ghanaians on the staffs of the two Universities should not involve the displacement of existing expatriate members of the staff In fact, the Government recognizes that the expansion of higher education will make it necessary to continue, for some time to come, the recruitment of overseas personnel on short-term contracts

The total 'high-level man-power' requirement during the period 1960–65 in administrative, managerial and professional employment and in secondary school teaching has been estimated at 7,000, or an average annual requirement of 1,400 To meet this there must be an increase, as rapidly as possible, in the flow of students into the two Universities Under the present entrance regulations, possible student numbers are controlled by the number of those obtaining the General Certificate of Education with two subjects at advanced level This consequently depends on the extent to which sixth-forms have been developed in the secondary schools On the basis of existing sixth forms and plans for expansion of sixth-form work, it has been estimated that the student population of the Universities in 1964 would be about 1,400, representing an annual output of some 450 graduates This estimate does not take into account courses at Kumasi in such subjects as engineering, architecture and pharmacy, which can be entered at the ordinary level of the General Certificate of Education To ensure that the rate of development of university education is not so dependent on the rate at which sixth forms can be developed, it is proposed that there should be a special entry into the University of Ghana for students who have passed General Certificate of Education (ordinary level), but who lack the normal advanced-level qualifications, similar to the arrangement which already exists at Kumasi. By 1964 the estimated annual output of General Certificate of Education ordinary-level certificates will be about 1,800

It has been agreed that the two Universities should remain predominantly residential, though making provision for a proportion of non-residential students To accommodate the increased student numbers at Legon, the Government has authorized the building of a fifth hall of residence, to accommodate 320 students At the same time plans are to be drawn up for the building of hostel-type annexes to the four existing Halls, which at present can accommodate about 700 students It has often been suggested that the system of hall membership has tended to inhibit the growth of student life and restrict students' social activities To overcome these objections, and to cater for non-residential and part-time students, the Commission has proposed that centrally situated cafeterias, common rooms, gymnasia and other common facilities for staff and students should be built at both Universities

With the ending of the 'special relationship' with the University of London, the time was considered opportune to review the structure of degree courses Many of the suggestions presented to the Commission on this matter would be met by an arrangement whereby all students in their first year would take one of a limited number of prescribed general courses Each of these courses would normally include three subjects Students could then proceed either to a two-year general degree course in two or three subjects or to a special degree course in one or two subjects, terminated by a final examination In addition, all students at both Universities would take some courses in African studies Since much of the re-organization of the structure of degree courses has already been under consideration, it is hoped that students entering the University of Ghana in October 1961 would begin at once to work for the B A and B Sc degrees of the new University

In considering the division of responsibilities for teaching and research between the existing Colleges at Legon and Kumasi there were three areas in which actual or potential overlapping existed—in engineering, agriculture, and in work for general degrees The Commission recommended that engineering be concentrated at Kumasi, together with architecture, building technology, rural and urban planning, and pharmacy The four-year diploma course in agriculture at Kumasi should be strengthened, although the degree course in agriculture should be confined to Legon It is hoped that with the development of science laboratories at Kumasi, it might be possible to start general degree courses in some combination of science and technology , metallurgy, wood technology, agricultural engineering and industrial chemistry are cited as examples The Government accepts the Commission's proposal for the establishment of an Institute of African Studies, based on the University of Ghana, but having some measure of autonomy The future of the College of Business Management at Achimota remains uncertain, and the National Council will examine ways of associating the College and also the Ghana School of Law with the Universities The Commission welcomed the suggestion made by Prof Carl Iversen, vice-chancellor of the University of Copenhagen, that the Government of Denmark might be willing to associate itself with a scheme for establishing further residential adult colleges in the various regions of Ghana

In addition to the main proposal that the Colleges at Legon and Kumasi should become independent Universities, the Commission has recommended that a University College of Cape Coast be established This College would be in some relationship with the University of Ghana, though few of the details have been worked out

As one phase of the development of higher education in Ghana ends and another begins, the Government has paid tribute to the encouragement and practical assistance given to the Colleges by the University of London, the Inter-University Council for Higher Education Overseas and the Council for Overseas Colleges of Arts, Science and Technology It records with satisfaction the high standards already achieved by the Colleges and its confidence in their future as independent Universities

OBITUARIES

Dr Otto Maass, C B.E., F R.S.

Dr Otto Maass, one of the most eminent of Canadian chemists, died in Montreal on July 3 at the age of seventy As assistant to the President of the National Research Council during the war years, director of chemical warfare in the Department of National Defence and later as scientific adviser to the Chief of General Staff, he was well known to a multitude of colleagues in both the United Kingdom and the United States As general director of the Pulp and Paper Research Institute of Canada, he had a wide acquaintance in the pulp and paper industry But he is best and most affectionately remembered by the many generations of graduate students who gained their first insight into the significance of physical chemistry and the meaning of chemical research under his stimulating guidance

Otto Maass was born in New York City on July 8, 1890, but went to Montreal with his parents at an early age He was educated in Montreal High School and McGill University, obtaining the B A degree in 1911 and the M Sc in 1912 He was awarded an 1851 Exhibition scholarship and went to Berlin in 1913 to work in the laboratory of Prof Walther Nernst Trapped in Germany by the outbreak of war in the following year, he was able to escape across the border into Switzerland and thence return home His interrupted studies were continued at Harvard under the late Prof T W Richards He submitted a thesis and received the Ph D degree from Harvard in 1919

In 1917 he was appointed lecturer in physical chemistry at McGill In 1923 he became Macdonald professor of physical chemistry and, in 1937, chairman of the Department, appointments which he occupied until his retirement in 1955

From the very outset of his teaching career, he began to be surrounded by a rapidly expanding group of enthusiastic young graduate students eager to share in the development of his ideas One very early achievement was the preparation, for the first time, of pure hydrogen peroxide , and this gave rise to a whole series of publications reporting accurate measurements of its physical properties Another early investigation involved devising a simple and accurate method of measuring densities of condensable gases This was ultimately refined to the point where reliable figures for the atomic weights of carbon and sulphur were obtained from the molecular weights of carbon dioxide and sulphur dioxide Meanwhile, similar techniques had been applied to observe density changes on mixing two gaseous components and to detect reaction between two components in the vapour phase This led on to a comparison of reaction velocities below and above the critical temperature which, in turn, gave rise to the prolonged series of investigations of critical phenomena which brought about a wholesale revision of ideas concerning the critical region

As early as 1920, Maass became aware that very few reliable physical data were available on sulphur dioxide solutions such as were used in the manufacture of sulphite pulp Work in this field was followed by a series of investigations of the factors influencing the rate of penetration of sulphite solutions into wood chips In 1928 the Pulp and Paper Research Institute of Canada was founded, and by arrangement with the Graduate Faculty of McGill, Maass and his students were enabled to pursue further researches in the laboratories of the Institute He became its general director in 1940 and was instrumental in initiating a variety of investigations of problems directly concerned with the war effort

On his retirement in 1955, Maass was appointed a principal research officer in the Division of Chemistry, National Research Council, and he spent the next three years in the laboratories of the Council in Ottawa Then he returned once more to McGill as a research associate in the Chemistry Department Much of his time was spent in his laboratory in the Chemistry Building up to the day of his death

Space does not permit even a bare enumeration of the degrees, medals, memberships of learned societies and other honours which came to him It would seem, in any event, superfluous to those who knew him His work was his life and brought with it its own reward By his work he will be remembered

J H Mennie

Prof R F Naylor

Ralph Francis Naylor, professor of chemistry in the Royal College, Nairobi, was killed in a motor accident at Mkushi in Northern Rhodesia on August 6 In this tragic accident, at the regrettably early age of thirty-nine, one who has done much for chemistry and for university education generally in East Africa was lost

Born in 1921 in London, Ralph Naylor was educated at Emanuel School and at the Imperial College of Science and Technology, London, where he graduated B Sc with honours in 1942 He then joined the British Rubber Products Research Association where he worked on olefinic reactivity and aliphatic sulphur compounds Some twelve publications on this work resulted, including one in *Nature*, over the period 1943–1949

In 1949 he went to Makerere College as a lecturer in organic chemistry and became a senior lecturer three years later In September 1953 he was given nine months leave of absence to work with Dr J H Hanks in the Department of Bacteriology and Immunology at Harvard, in which he was assisted by Smith-Mundt Research and Fulbright Travel Grants He returned to Makerere as acting head of the Chemistry Department The head of Department, Prof Tenniswood, had died shortly before, also in a motor accident He acted in this capacity for nearly two years Although one of the new chemistry buildings had just been completed, much of the design of the second building and the planning for future expansion, which he performed enthusiastically and in masterly fashion, fell to him

In spite of these increased responsibilities, Naylor continued his research on the chemotherapy of leprosy drugs He took much interest in leper colonies and villages throughout Uganda and neighbouring territories He was on the Board of Governors of the Kumi Leprosy Settlement, which he visited regularly Having decided that a radiochemical approach to this problem was likely to be fruitful he spent most of one long vacation at Harwell learning tracer techniques, so that he might design and equip a radiochemical laboratory in the Chemistry Department at Makerere He read a paper on his work at the seventh International Congress on Leprosy in Tokyo in 1958

The East Africa Section of the Royal Institute of Chemistry held its first annual general meeting early in 1956 Ralph Naylor was one of those responsible for its foundation He became the Section's first secretary, and up to the time of his death he never relaxed in arranging, organizing and reporting meetings, visits, excursions and exhibitions East African chemists owe him a particular debt in this connexion

At Makerere he always took an active personal interest in students and student affairs, particularly in his own tutorial group He was for a time a resident tutor, and later deputy warden of Mitchell Hall, one of the student halls of residence He was much sought after as a lucid lecturer, an enthusiastic committee member and an impartial chairman Ralph Naylor was a man of deep religious conviction He was the founder leader of a Boys' Crusader Bible Class in Kampala, and also for some years secretary of the Uganda auxiliary of the British and Foreign Bible Society

His interest in open-air activities was shown by his love of travel and mountain climbing He was for a time president of the Uganda Mountain Club, and had made ascents of several of the difficult Ruwenzori peaks as well as other mountains in East Africa He was also a trustee of the East Africa Outward Bound organization, which has its headquarters at Loitokitok at the base of Kilimanjaro, and carries out its activities on that mountain He had also been president of the Uganda Amateur Athletic Association at the time when Uganda was beginning to play a part in international athletics Photography was one of his hobbies

In 1955 he married Miss Dilys Rees She was slightly injured in the accident through which he died, and their son Paul, aged four, rather more seriously

In January 1961 he took up duty as first professor of chemistry at the Royal College, Nairobi, and in his short time there he was also dean of the Faculty of Science, and worked enthusiastically on the planning of the new chemistry building It is sad that he will not now see the building through to final completion and occupation

It will thus be clear that Ralph Naylor was characterized by the energy which he put into so many diverse activities, and the thoroughness with which he carried them out He took a pride in meticulous planning down to the finest detail and his plans nearly always succeeded His loss will be felt by his many friends and by all who have an interest in scientific education and development in East Africa

MALCOLM CRAWFORD

Sir Arthur Olver, C B , C M.G.

WITH the death on August 15 of Sir Arthur Olver at the age of eighty-six, the veterinary profession has lost one of its most eminent authorities on livestock development The son of a successful Cornish livestock breeder, he was early introduced to the exactions of animal husbandry After studying in London and becoming a member of the Royal College of Veterinary Surgeons, of which he later became a Fellow, he was commissioned in the Army Veterinary Department some months before the outbreak of the South African War

He saw active service with the cavalry, and later, as senior veterinary officer, Natal, first showed his flair for administration

In 1904 he obtained permission to work under Theiler at his Daspoort laboratory when that authority was so successfully competing with the prevalent epizootics, as well as demonstrating with exactness connexions between nutrition and disease In 1906, while still a captain, he was appointed principal veterinary officer, Egyptian Army and the Sudan Civil Service In his first year he stamped out rinderpest in the Nile Valley, organized the Sudan Veterinary Service and enabled the cattle trade between Central Africa, the Sudan and Egypt to be reorganized on a satisfactory basis, for which he was awarded the Order of Osmanieh, 4th class.

He then was appointed assistant director general, Army Veterinary Service, at the War Office For the greater part of the First World War he served at headquarters of the British Expeditionary Force and besides being mentioned in dispatches four times was made a C M G In 1917 he was sent to re-organize the veterinary arrangements of the Remount Commission in the United States and Canada, where equine infectious diseases were causing havoc Once again his efforts were successful and he was made a C B

In 1930, when a colonel, he retired from the Army to become animal husbandry commissioner with the Government of India, an appointment which had been created on the recommendation of the Royal Commission to investigate the state of agriculture in India During his eight years in that office he brought under centralized supervision all aspects of official livestock research and development throughout the subcontinent, drafted an all-India Act for the Control of Contagious Diseases of Animals, defined and published a description of most of the important breeds of cattle in India and organized the All-India Cattle Show Society as well as originating research and promoting veterinary education. He was knighted in 1937.

He left India in 1938 to become principal of the Royal (Dick) Veterinary College in Edinburgh, which he administered through the difficult war years that followed. He retired from Edinburgh and public life in 1946 to farm with the enthusiasm and zest with which he had pursued all his undertakings.

He had many outside interests, but he excelled at, and derived most pleasure from, field sports. Since an illness some five years ago lessened his physical activity he took up painting with the single-minded concentration so characteristic of him. Two of his paintings were accepted by the Royal Academy, and he was greatly amused that a critic predicted a promising career for the artist.

He is survived by a widow and one son.

Mr. W. J. Richards, C.B., C.B.E.

MR. W. J. RICHARDS resigned from the post of director of the Royal Radar Establishment in July in order to become first director of the new Staff College for Further Education recently established by the Ministry of Education (*Nature*, 190, 308; 1961). He joined the Scientific Civil Service in 1925, and was attached to the Royal Aircraft Establishment, Farnborough, where most of his active research work was carried out, his main interest being in the development of instruments for use in aircraft. He was appointed head of the Instrument Department in 1936. After a period at Ministry of Aircraft Production Headquarters in London, Mr. Richards succeeded Dr. W. B. Lewis in 1946 as chief superintendent of the Telecommunications Research Establishment, Malvern, and when this was amalgamated with the Radar Research and Development Establishment in 1953 (*Nature*, 172, 277; 1953) he was made director of the combined establishment now known as the Royal Radar Establishment. Under his directorship the amalgamation was achieved in a happy and efficient manner and the Royal Radar Establishment became a central research establishment for electronics serving both the Royal Air Force and the Army. It has played a notable part in the expansion of Britain's defence system, and, in particular, has made significant contributions to the electronic aspects of guided weapons, to the electronic equipment of the V-bomber force and to the modernized early-warning radar. The Establishment has achieved an international reputation for fundamental physics research, particularly in the physics of solids, and has pioneered in the development of many new radio techniques now commonly used in industry. One of Mr. Richards's main interests has been in education, and training of new staff members. It was largely due to his initiative that the Malvern College of Electronics was founded, in association with the Royal Radar Establishment. His new post will give him further scope for the development of these interests.

Dr. G. G. Macfarlane

DR. MACFARLANE, at present deputy director of the National Physical Laboratory, has been appointed to succeed Mr. Richards as director of the Royal Radar Establishment. Dr. Macfarlane, who is forty-five, graduated with first-class honours in electrical engineering at the University of Glasgow in 1937, and went on to do two years postgraduate research at Dresden, where he obtained the degree of Dr. Ing. in 1939. He joined the Telecommunications Research Establishment (now the Royal Radar Establishment) in 1939. Throughout the War years he concentrated on mathematical problems in radar and microwave physics. In 1945 he became head of the Mathematical Group and a year later took charge of the Theoretical Physics Division. In 1953, Dr. Macfarlane began individual research work on semiconductors in the Physics Department at the Royal Radar Establishment. In a series of fundamental studies of the optical properties of germanium and silicon he and his group obtained and explained detailed fine structure in the absorption spectra of germanium and silicon over a wide temperature-range. They demonstrated the occurrence of excitons and phonon-assisted indirect transitions in the absorption edge spectra of these semiconductors. He continued this work until early 1960 when he became deputy director at the National Physical Laboratory with special responsibilities for relations between the Laboratory and industry. Dr. Macfarlane will take up his new appointment at Malvern in March 1962.

Chemistry in the University College of Sussex:

Prof. C. Eaborn

DR. C. EABORN has been appointed professor of chemistry in the new University College of Sussex. He is best known for his publications on the chemistry of organosilicon compounds, including a book of which Prof. H. J. Emeléus recently wrote, "The outstanding impression on reading this book is that, for the first time, order has been introduced into the widely scattered literature". His major research contributions have involved mechanistic studies of reactions of silicon–hydrogen and silicon–carbon bonds, particularly cleavages of aryl–silicon bonds. He has shown that these cleavages are usually electrophilic aromatic substitutions, and with his co-workers has accumulated a large body of information on effects of substituents on the ease of such substitutions, has extended the study to include the reactions of aryl–germanium, –tin, and –lead bonds, and he has shown that these cleavages are useful in synthesis; for example, they can be used to attach a nitro- or sulpho-group at a specified position of an aromatic compound. Recently, Dr. Eaborn and his co-workers, using a simple method they devised for counting tritium, have carried out detailed studies of the rates of acid-catalysed aromatic hydrogen-exchange reactions, and the results, combined with those from the aryl–metal cleavages mentioned here, have been used to test and modify concepts of electrophilic substitution based in the past on more familiar reactions such as nitration Incidental observations in the course of Dr Eaborn's work which attracted considerable attention were the first isolation of an optically active organosilicon compound having a silicon as its single asymmetric centre, and his detection of the mesomorphism of di-isobutylsilane diol, which does not fall into any one of the three classes previously thought adequate for classification of liquid crystals

Dr Eaborn's researches involve at present, in addition to extensions of the work mentioned here, a general study of mechanisms of reactions of organometallic compounds, including the effects of high-energy radiation on such compounds, and investigation of the reactivity of fluorene derivatives Dr Eaborn is a graduate of the University of Wales, of which he holds the D Sc degree He was appointed an assistant lecturer in the (then) University College of Leicester in 1947, promoted lecturer in 1950, and in 1954 was given the title of reader in physical-organic chemistry in recognition of his distinguished work in that field He has recently been awarded a Robert A Welch visiting scholarship at the Rice University in Texas, which he expects to take up early in 1962

The Falkland Islands Dependencies Survey

The R R S *Shackleton* left Southampton on October 3 for the Falkland Islands Dependencies Survey, 1961–62, taking twenty scientists and technicians of the Survey and two meteorologists for South Georgia The R R S *Shackleton* has been extensively used since it was taken over by the Survey in 1955 Earlier this year, using the *Shackleton,* the Survey was able to collect geological specimens from the Clerke Rocks and to make landings on Visokoi Island (South Sandwich Group), Leskov Island and Vindication Island During the same voyage, a magnetic survey of the Scotia Arc (the submarine mountain range running from South Georgia through the South Sandwich Group and the South Orkneys to the South Shetlands) was carried out Mr Cameron and Mr Kennett, who were responsible for this survey, hope to take seaborne seismic soundings this season in the same area, extending their magnetic study of the rocks below the ocean floor, with the view of tracing the course of the Arc and its connexion with the Andean mountains of South America Also arranged for the R R S *Shackleton* is a series of regular observations to check the secular change in the Earth's magnetic field, this investigation is being made at the request of Prof Takesi Nagata, Tokyo University, on behalf of the International Union of Geodesy and Geophysics

The purpose of the Falkland Islands Dependencies Survey, the director of which is Sir Vivian Fuchs, is to carry out scientific research in the Antarctic, under the administrative control of the Governor of the Falkland Islands For nearly seventeen years it has maintained permanent bases on the mainland of Graham Land and on nearby islands At these bases between ninety and one hundred scientists and technicians spend periods of up to two years carrying out a systematic series of investigations which, so far, have been producing valuable information about the weather and structure of the south polar continent In addition, numerous investigations are being made in the fields of geophysics and human physiology in Antarctic conditions Each Antarctic summer (November–March) the sea ice clears sufficiently for specially strengthened ships, such as the R R S *Shackleton,* to make voyages to these bases with relief staff and stores

Russian Space Research

Recent cosmic flights in the U S S R found their reflexion in the popular scientific journal, *Priroda,* for 1961 Thus, N M Sisakyan (1, 7) discusses the biological factors, while space–time problems are discussed by D A Frank-Kamenetsky (1, 16) and by A S Kompaneets (5, 17); V G Kurt (2, 23) discusses the upper atmosphere and the interplanetary space V D Davydov (3, 3) concerns himself with the Earth–Venus flight, and finally in No 5 (May) of *Priroda* there is a number of articles dealing with the flight of Y A Gagarin on April 12 (pp 3, 5, 6, 8, 14, 16) The space ship which circumnavigated the Moon on October 7, 1959, automatically photographed the other side of the Moon, and an account of these photographs and of the map constructed of the other side of the Moon are given by Y N Lipsky (*Priroda,* 1, 35, 1961), a map on the scale of 1 10,000,000 is appended

Atomic Energy and its Applications

Atoomenergie en haar Toepassingen (Atomic Energy and its Applications), the scientific and technical periodical published under the auspices of The Netherlands Reactor Centre (Reactor Centrum Nederland), normally contains articles in Dutch dealing with various aspects of nuclear energy, but the June issue (3, No 6), which is devoted entirely to the activities and achievements of the nuclear industry in The Netherlands, is printed in English for the benefit of a wider public The introductory article, which is written by Prof M Bogaardt, adviser to the Centre, gives a general picture of the industrial activity in the nuclear field in The Netherlands, and is followed by a brief illustrated description of the Centre and a number of short articles contributed by leading Dutch firms The comprehensive buyers' guide of nuclear and allied products, materials and services—the first of its kind—which concludes the issue, has been compiled from answers received to a questionnaire circulated among a large number of Dutch firms which are actively engaged in the nuclear field The guide consists of two sections, the first being an alphabetically arranged classified list of products with the names of the respective manufacturers, and the second an alphabetical index of firms and their addresses with brief details of their chief products

Society for Folk-Life Studies

A very successful conference to inaugurate the Society for Folk-Life Studies was held at University College, London, during September 6–8, 1961 More than eighty people from many parts of Great Britain and Ireland attended and, at a general meeting held on September 8, the Society was formally established The following officers were elected *President,* Dr Iorwerth C Peate (Welsh Folk Museum), *Vice-President,* Mr Andrew Jewell (University of Reading), *Secretary,* Mr J Geraint Jenkins (Welsh Folk Museum), *Treasurer,* Mr Stewart F Sanderson (University of Leeds) The following members were elected to serve on the Council Mr Frank Atkinson (Barnard Castle, Durham), Mr G Ewart Evans (Ipswich), Mr A T Lucas (National Museum of Ireland), Mr B R S Megaw (University of Edinburgh), Mr C S Mundy (University of London), Dr Melville Richards (University of Liverpool), Mr G B Thompson (Ulster Folk Museum), Mr D M Wilson (British Museum)

Membership is open to all individuals and institutions interested in the study of the traditional patterns of life both in rural and urban communities Although various bodies such as the Folklore Society, the British Agricultural History Society and several other societies are each interested in particular aspects of folk-life and social history, this new Society to cover the complete field fulfils a long-felt need It can serve as a focus for the activities of those individuals, amateur and professional alike, who take an interest in their native culture In addition to holding an annual conference at various centres in Great Britain and Ireland in turn, the Society will also publish its own journal Further information can be obtained from the Secretary, c/o Welsh Folk Museum, St Fagans, Cardiff

The Mankind Quarterly

A RECENTLY published new journal seems to be devoted to the promotion of the idea of the basic significance of the biological endowment of human races in determining psychological and cultural characteristics (*The Mankind Quarterly An International Journal dealing with Race and Inheritance in the Fields of Ethnology Ethno- and Human Genetics Ethno-Psychology Racial History Demography and Anthropo-Geography* Vol 1, No 4, April 1961, Vol 2, No 1, July–September 1961 Edinburgh 6*s* each) It presents some descriptive articles, for example, on the Kurumbas and Todas of the Nilgiri Hills of South India (by Ruggles Gates) and on Bantu facial conformation (by J D J Hofmeyr and H Hitzeroth), and some cautiously analytical ones, for example, on "the cultural hypothesis" of mental types (by Gutorm Gjessing) But most of the contributions argue strongly that there is a close relation between innate physical and mental racial characteristics In various contexts it is stated· that there is a genetic predilection for certain cultural forms, that there is a significant correlation between the occurrence in ancient times of "the Aryan speech" and the peoples of largely Nordic strain that within any society an intellectually *élite* group tends to maintain its genetic superiority through selective mating The "equalitarian dogma" of Negro aptitudes—as illustrated by Gunnar Myrdal's work—is attacked, and it is implied that social segregation of the Negro in the United States would be a proper course The material in this journal is of very uneven quality and it is unreliable as a guide for students

The South Australian Museum

MUSEUMS in many places are, at the present time, undertaking extensive re-organization schemes The report of the Board of the South Australian Museum for 1959–60 is yet another example of this world-wide movement, and it is only labour and finance which dictate the speed of these transformations (Pp 16 Adelaide Government Printer, 1961) The activities of the Museum include television broadcasts, a display of Australian wild flowers at the Adelaide Festival of Arts and an extensive programme of field work both in archæology and natural history A rather unusual feature is the formation of an underwater research group, the members of which have collected marine invertebrates and have been especially successful in stupefying fish by means of the distribution of rotenone in the wreckage of a ship lying in 50 ft of water The fish are collected in nets by the aqualung divers Members were fortunate in being able to observe and capture two specimens of the rare leafy sea-dragon, *Phycodurus eques*

Neurology of Language

IN a wide-ranging review of the neurology of language, Sir Russell Brain shows how difficult it is to infer from cases of aphasia the physiological organizations underlying speech (*Brain*, 84, Part 2, 1961) He also shows the inadequacy of purely psychological classifications of aphasia and of the attempt to correlate disturbances which can be classified psychologically with lesions in particular situations The physiological organizations on which speech depends are of great complexity, extending over considerable areas of the brain, and are organized in time as well as in space These serve psychological functions, but the breakdown of a physiological schema does not necessarily, or indeed usually, disturb speech in a way that corresponds to a single type of psychological defect Moreover, the anatomical organization of the schemas means that only rarely will a single type of schema be disturbed in isolation from others What the clinician calls aphasia is almost always the product of a mixture of physiological disturbances resulting in a complex medley of psychological disabilities For the present, the classification of the aphasias must be largely empirical The task for the future is to use all the available modern methods of psychological testing, linguistics, phonetics and communication theory, to correlate psychological with physiological functions Already the directions in which progress is likely to be made can be seen From a number of investigations it is hoped to arrive at an analysis of speech disturbances at both the psychological and physiological levels, and of their interrelationships, which will provide a scientific basis for the recognition of the type of disorder of function present in each individual aphasic patient

Immunization against Disease

THE subject for discussion at the Thirteenth World Health Assembly in 1960 was "The Role of Immunization in Communicable Disease Control" A recently published volume contains the introductory address of the chairman, Prof Zhdanov of Moscow, papers on the background of immunization, by Prof Cruickshank of Edinburgh, and the efficiency of immunization procedures used in public health practice by Prof Edsall of Harvard, there is also a paper on compulsory or voluntary vaccination, by Dr J de Moerloose of the World Health Organization, and finally, the report of the technical discussion (*The Role of Immunization in Communicable Disease Control* Various authors World Health Organization Public Health Papers No 8, 1961 Pp 118 Price 6*s* 8*d* Also published in French Available through H M S O) There are nowadays so many vaccines and immunization schedules that the average practitioner is understandably bewildered and uncertain which to use and when This small volume contains authoritative and up-to-date views on the value of the various vaccines, and the pros and cons of immunization as well as the most suitable times for vaccination

Producing Transplantable Human Tissues in the Laboratory

The July issue of *Discovery* contains an article by Dr. D. Petrucci, Medical Biological Studios, Bologna, entitled "Producing Transplantable Human Tissue in the Laboratory". The article resulted from Dr. Petrucci's original work on building tissues which, in contrast to adult tissues, would be transplantable and acceptable by adult organisms. The idea was that the chances of a glandular transplant surviving would be improved if the gland were obtained from an embryo that is first cultivated outside the maternal body. The technique was to fertilize the ovum between two chamois disks, in what Dr. Petrucci calls his "biological cradle". Various 'cradles' have been used in which the developing zygote and embryo could be photographed continuously. The article is extensively illustrated, and the 48 illustrations show the fertilization and development of the embryo covering a period of 58 days of growth from fertilization; they also demonstrate the 'cradle'. In a field so sparse in workers, who themselves tend to be highly sceptical of all and everybody's work in that field, it is a pleasant relief to find a general article. The illustrations will be of great use to science teachers.

Geology and Ceramics

To mark the occasion of the Seventh International Ceramic Congress, held in London during May 1960, a special exhibition of rocks and minerals used by the British ceramic industry was shown at the Geological Museum in South Kensington. A booklet (*Geology and Ceramics*. Pp. ii+28. London: H.M.S.O., 1961. 3*s*. 6*d*. net), prepared by Dr. P. J. Adams, was issued to give a brief account of the rocks and minerals used in the industry, describing their nature and geological occurrence. The many ways in which the raw materials are used by the ceramist, potter and engineer are also described. The booklet is well illustrated and the subject-matter is dealt with under the headings of pottery and whitewares, structural clay products and refractories and technical ceramics.

Announcements

The first award of the Herbert E. Gregory Medal for distinguished service to science in the Pacific, established by the Trustees of the Bernice P. Bishop Museum, Honolulu, Hawaii, in memory of Prof. Herbert E. Gregory, director of Bishop Museum during 1919–36 and Silliman professor of geology in Yale University, was recently made at the tenth Pacific Science Congress to A. P. Elkin, emeritus professor of anthropology at the University of Sydney. Prof. Elkin is distinguished by his contribution to anthropological research in Australia and Melanesia and by his active role in the development of institutions supporting Pacific research.

Prof. Seymour S. Kety, professor of psychiatry, Johns Hopkins University, has been awarded the Alvarenga Prize by the College of Physicians of Philadelphia for his work on cerebral blood flow and the effect of drugs on the central nervous system.

Oscar A. Quihillalt, of Argentina, has been elected president of the International Atomic Energy Agency at its recent meeting in Vienna.

Dr. J. W. Menter has been appointed director of the Tube Investments Research Laboratory at Hinxton Hall, near Cambridge. The Laboratory carries out fundamental research in metal physics and physical metallurgy. During seven years at Hinxton, Dr. Menter has directed research teams studying the microstructure of metals and has promoted notable advances in the techniques of electron microscopy and X-ray microanalysis.

Mr. J. C. Hanbury, chairman of Allen and Hanburys, Ltd., has been elected chairman of the British Pharmaceutical Conference for 1961–62. Mr. Hanbury took the Natural Science Tripos at Cambridge and later obtained the degree of bachelor of pharmacy of the University of London. He has spent the whole of his working life with Allen and Hanburys, Ltd.

Dr. W. J. Bates, lecturer in physics at the University of Bristol, has been appointed chief engineer at R. and J. Beck, Ltd. Dr. Bates will lead Beck's design team at the Lister Works, Dickenson Street, London, N.W.5. Later he and his team will move on to the Company's new factory at Watford when it is completed.

The Basic Science Section of the British Ceramic Society is holding a meeting on "Ceramics in Nuclear Science" at the Atomic Energy Research Establishment, Harwell, during November 28–30. Further information can be obtained from Dr. J. P. Roberts (honorary section secretary), Houldsworth School of Applied Science, University, Leeds, 2.

The Institute of Biology is organizing a symposium on "The Better Use of the World's Fauna for Food", which will be held in the Lecture Hall, Royal Geographical Society, Kensington Gore, London, S.W.7, during October 27–28. Attendance at the symposium is open, and further information can be obtained from the Institute of Biology, 41 Queen's Gate, London, S.W.7.

A short course on "Chemical Applications of Diffraction Methods" is being organized by the Department of Chemical Technology, Bradford Institute of Technology, and will be held at the Institute during November 24–25. The fee for the course is 45*s*., and further information can be obtained from the Registrar, Institute of Technology, Bradford, 7.

The autumn meeting of the Parasitology Group of the Institute of Biology is to be held at the National Institute for Medical Research, Mill Hill, London, N.W.7, on November 10. The meeting will be devoted to a series of papers under the general title of "Parasites of World Importance". Further information can be obtained from the acting secretary of the Group, L. P. Joyner, Central Veterinary Laboratory, Ministry of Agriculture, Fisheries and Food, New Haw, Weybridge, Surrey.

The South London Branch of the British Institute of Management is organizing a second conference on the preparation and use of case studies. This is to be held at the British European Airways Staff College, East Burnham, Slough, Bucks., during October 13–15. Inquiries should be addressed to Mr. B. E. Baldrey, Conference Secretary, Palmer's Travelling Cradle and Scaffold, Ltd., 3 Woodside Green, London, S.E.25.

Erratum. In the article entitled "A New Test for detecting Anaphylactic Sensitivity: the Basophil Reaction", appearing on p. 1056 of the September 9 issue of *Nature*, the fixative solution consisted of ethyl alcohol 6 ml., chloroform 2 ml., and acetic acid 2 ml. The solution did not contain acetone as stated.

R 327

UNIVERSAL LANGUAGE FOR COMPUTING MACHINES

THE traditional pattern of Section A* (Mathematics) meetings at the British Association, consisting of a division into pure and applied mathematical sessions, was this year preserved with a difference

On September 1 at Norwich the 'pure' session opened with a paper by Prof R L Goodstein having the title "Truth Tables" Starting with a simple account of formal mathematical logic Prof Goodstein showed how the apparently 'basic' operations *and*, *or*, *not*, etc , could successively be reduced to a single pair and, eventually, to the single 'Sheffer stroke' function The talk was a model of systematic presentation and took the audience from the elements to up-to-date research in the field of multi-valued logics

In the discussion which followed it was made clear that this very 'pure' subject had considerable practical application, particularly as the Sheffer function gives a means for constructing the most complex digital computer from a single type of building block

The second paper, by Prof P J Hilton, was concerned with group theory and showed how the basic ideas of elementary arithmetic might better be taught via this fundamental discipline than by the present rote-learning methods

To conclude this session, a paper by Dr P F Scott described the characteristics of the various kinds of radio telescope After showing that any large increase in size over the instrument at Jodrell Bank was impossible, he went on to show that, by using relatively small movable aerials of simple geometry, and by making the rotation of the Earth act as a scanning mechanism the effect of receiver areas of several acres could be simulated The catch was, that to obtain a picture of the heavens of the type used by astronomers, it was necessary to use a digital computer to process the 250,000 or so observations Thus the first session ended with a distinct flavour of computers

On September 5, there was a symposium on artificial computer languages Mr P V Ellis, of International Computers and Tabulators, Ltd , opened the meeting by explaining how, in the early computers, a programme was set into the machine almost by the individual operation of switches which controlled the electronic elements He pointed out that an operation which took only a few human words to mention might take as many thousands of the code symbols understandable by a computer From this basis he explained how the notion of a human/machine language for communication arose and described the early attempts at formulating such systems for both mathematical and business use These were, he said, now tending to merge, but difficulties existed because, while the language of mathematics was relatively precise, that of commerce was not. so that the same words might mean quite different things to different people

To show the three stages of interpretation which are involved, the example of developing a simple statement like "We wish to take Smith's pay and compute the income tax", into a detailed procedure expressed in words and appropriate mathematical symbols and thence into a detailed machine coding, was analysed After rejecting the simple solution that accountants and business men should learn mathematics—"because they will not"—current progress in the development of a commercial language 'Cobol' was described The value of such a language, if accepted, was shown by the fact that, over the life of a machine, the cost of programming was about 1½ times that of the machine itself

The theme of commercial computer languages was then taken up by Mr R M Paine, of the Corporation for Economic and Industrial Research After explaining that about 6,000 electronic computers of various sizes were now in operation, he went on to remark that a computer code such as

```
          60     6     31
    25    72     5     34
         400     4     17
              etc
```

would be difficult to explain to people unfamiliar with the particular machine concerned—and possibly even to those who were On the other hand, a statement in 'Cobol'

```
Overtime
    If month-number is not equal to 3,
    go to print
    If overtime rate is equal to 0,
    multiply salary by 0 015 giving overtime,
    otherwise multiply salary by overtime
    rate giving overtime,
    go to print.
```

could be understood by all

'Cobol' was a beginning of an agreed language and was accepted by the producers of some 90 per cent of the world's output of computers Some other attempts at artificial languages such as the Ferranti 'Nebula', were mentioned and the paper ended with an account of a modern development whereby computers could directly understand selected words of ordinary language presented to them

The scientific side of computer language was then taken up by Mr C Strachey, who suggested that programming was now emerging from its adolescent phase in which an intimate knowledge of the machine, *ad hoc* tricks, and infinite patience on the part of the programmer were of supreme importance He suggested that the two 'new techniques of greatest future promise were a function language, and the replacement of the idea of linear sequences of instructions by branched chains in which no attempt was made to maintain natural order, but in which each constituent gave explicit reference to its successors Having dismissed these topics Mr Strachey then developed an attack on British computer designers and research workers in the universities and elsewhere The burden of his discontent was that, whereas the American approach was to use a machine of any cost, however high, to save human effort, the British machines required the use of human genius to help the machine He ended by claiming that this trouble was caused by the absence of very large random access stores on the British machines

The last of the formal papers was read by Mr R G Goodman, of the Brighton College of Technology

The basic structure of the mathematical 'language' 'Algol' was explained and developed to the state in which a complete problem was coded for illustration.

The discussion was opened by Dr A. D. Booth, of Birkbeck College, London, who, after commenting on the implication of Mr Ellis's figure of 1½ for programming/machine cost, pointed out that Mr Strachey's strictures were, to a large extent, unjust. The ideas of function languages were well known in Great Britain and much work has been done in them. The branched chain technique had been in use at Birkbeck College for at least three years and was described in several papers so that a claim that "no one in Britain had experience of it" was patently false. So far as lack of large, random-access, stores on British machines was concerned, Dr Booth maintained that far from being due to lack of imagination the situation was actually caused by lack of Government support for British machines.

A vigorous discussion in which the topics ranged from qualifications and training of programmers to the various kinds of 'meta-language' in machine translation, ended the session. A. D. BOOTH

PHILOSOPHICAL TRANSACTIONS OF THE ROYAL SOCIETY

By Dr W. P. D. WIGHTMAN

Department of History and Philosophy of Science, King's College, University of Aberdeen

THE spate of publications relating to the Royal Society of London during the past two years seems to have increased rather than diminished the already existing misunderstanding of the relation between the Society and the famous periodical which it encouraged, but for which on several occasions the Society published or caused to be published disclaimers for any responsibility. Recently, references have been made to volumes of the *Philosophical Transactions of the Royal Society* (sometimes with '*of London*' added) in the seventeenth century, when no periodical with this title existed, statements have been made (or implied) that there was only one (or no) interruption in its publication, and, worst of all, that it was the 'official' journal of the Royal Society. The precise title would perhaps not be of any serious import but for the fact that the inclusion of the words 'of the Royal Society' suggests that it was a record of the 'Transactions' of that body and hence gives plausibility to the term 'official'. Since statements about the *Philosophical Transactions* (a few incorrect, and others by condensation definitely misleading) are scattered about over a large number of recent articles, it seemed desirable to assemble a sufficient number of 'advertisements' by the Society or its officers to establish the facts relating to the *Philosophical Transactions*. The purpose of this article is thus primarily bibliographical in the broad sense: it is not concerned with the purpose or quality of the *Transactions*. It is based on an examination (though, of course, far from exhaustive) of every volume of the *Transactions* (and *Philosophical Collections* to be referred to below) in the first two centuries of its existence.

The title on the first number issued and on the title page of every subsequent volume until Vol. 66 of 1776 was "Philosophical Transactions giving some accompt of the present undertakings, studies, and labours of the Ingenious in many considerable parts of the world".

There is no mention of the Royal Society other than in the imprint of its printers, John Martyn and James Allestry, and in Oldenburg's dedicatory epistle. Moreover, there is a clear indication that the editor and publisher had cast his net widely to get a representative review: the result was in fact a great deal more like *Nature* than a mere organ of publication of individual researches. But, despite this clear indication, confusion must have arisen at so early a date as to require the following disclaimer to be published in No. 12 of May 1666: "Whereas 'tis taken notice of that several persons perswade themselves that these Philosophical Transactions are publish't by the Royal Society, notwithstanding many circumstances to be met with in the already publish't ones that import the contrary: the Writer thereof hath thought fit, expressly here to declare that that perswasion, if there be any such indeed, is a mere mistake. Though he denies not, but that having the honour and advantage of being a Fellow of the said Society, he inserts at times some of the Particulars that are presented to them".

The last number of the *Transactions* in the first run was dated February 1679. From some time in the same year (colophon of first number) to April 1682 their place was taken by Robert Hooke's *Philosophical Collections* "containing an account of such physical, anatomical, . . . or other mathematical and philosophical experiments and observations as have lately come to the publisher's hands. As also an account of some books of this kind lately published". A similar 'advertisement' was printed in the number of December 1681. The *Philosophical Transactions* recommenced in January 1683 with the preface: "Although the writing of these *Transactions* is not to be looked upon as the Business of the Royal Society, yet in regard they are a Specimen of many things which lie before them . . . They have thought fit to take care for the revival thereof . . . ." Vol. 16 contained the numbers issued during 1686 and 1687 and bore the imprint "London 1688" (some previous volumes were printed at Oxford "at the [Sheldonian] Theater"). Thereafter, publication was suspended until early in 1691 "chiefly by reason that the unsettled posture of publick affairs did divert the thoughts of the curious towards matters of more immediate concern than are physical and mathematical enquiries . . . ". These were, of course, the years of the 'Glorious Revolution', and this gap in the *Transactions* has been overlooked in some accounts.

It is not possible, nor indeed necessary, to cite every declaration of editorial policy: all call the same tune with variations—a review of what is going on in the world of 'philosophy', including "an exact account of such experiments as having been made before the illustrious Royal Society they shall be pleased to order or permit the publication of" (Halley, 1714).

Then in the Volume 47 (London 1753, but as usual containing the numbers issued during the years 1751 and 1752) came the announcement of a fundamental change "The Committee appointed by the Royal Society to direct the publication of the *Philosophical Transactions*, take this opportunity to acquaint the public, that it fully appears, as well from the Council-books and journals of the Society as from the repeated declarations which have been made in several former *Transactions*, that the printing of them was always, from time to time, the single act of the respective Secretaries, till this present XLVII volume And this information was thought the more necessary, not only as it has been the common opinion, that they were published by the authority, and under the direction, of the Society itself, but also, because several authors, both at home and abroad, have in their writings called them the *Transactions of the Royal Society* [italic in original] .

"But the Society being of late years greatly inlarged it was thought adviseable that a Committee of their Members should be appointed to reconsider the papers read before them, and select out of them such, as they should judge most proper for publication in the future *Transactions*, which was accordingly done upon the 26 of March 1752 "

In 1752, then, for the first time the *Philosophical Transactions* were in fact, but not yet in name, "of the Royal Society" the old, and by then quite unsuitable, title was retained until Vol 66, dated 1776

That the announcement of this change of policy was not a mere formality is shown by reference to the Council minutes for January and February 1752, when a number of 'questions' put by Lord Macclesfield (not yet president) were considered The only one relevant to our purpose was whether there was any evidence of "intermeddling" by the Society with the *Transactions*, to decide which Thomas Birch, secretary, was requested to take the relevant literature home and examine it Within a week he had made a sufficient investigation to satisfy the Council, and the changes were made as already described

It remains only to add that the announcement made in 1752 appeared regularly for the next 123 years it appeared for the last time in 1875, by which time it was no longer true that "in late years" the Society had been "greatly inlarged", it had, on the contrary, in pursuance of the 'reforms' of 1847, been greatly reduced

DEOXYRIBONUCLEIC ACID: STRUCTURE, SYNTHESIS AND FUNCTION

THE eleventh Annual Reunion of the Société de Chimie Physique was held at the Col de Voza during June 26–30 and was devoted to papers and discussions on the structure, synthesis and function of deoxyribonucleic acid (DNA) There were some thirty contributors to the symposium and the total number of participants was about 100 The full texts of the contributions, including the discussions, are to be published in the October and November issues of *Journal de Chimie Physique* and will be republished afterwards in the form of a book

The papers were divided into groups according to their subject-matter and the meeting commenced with a session on "Macromolecular Structure of DNA" Ch Sadron (Strasbourg) presented results pointing to the existence of sub-units in DNA particles in solution and this was followed by a paper from C Levinthal (Cambridge, Mass) on the hydrodynamic shear degradation of *T*2 bacteriophage DNA in solution This degradation of DNA can be brought about by normal laboratory procedures, and this had led to the conclusion that the molecular weight of DNA in cells is probably very much greater than the 6–10 million usually quoted and might be as much as 100 million M H F Wilkins (London) presented new data on the *A*, *B* and *C* configurations of DNA and evidence against the existence of base pairing other than that of Watson and Crick In addition, the structure of denatured DNA and the relation of such structures to RNA was discussed X-ray diffraction studies on DNA in solution were reported by V Luzzati (Strasbourg), who concluded that the form and molecular weight of DNA were the same in dilute solution and in gels

The second session dealt with "Electronic Aspects of Nucleic Acid Structure" and started with a paper by B Pullman (Paris), who dealt with the electronic structure of nucleic acid constituents and the influence of this on the chemical and physico-chemical properties of DNA This was followed by a paper from M Kasha (Tallahassee), who was concerned with $n \rightarrow \pi^*$ optical transitions in polynucleotides, the exciton splitting phenomenon in hydrogen-bonded *N*-heterocyclic base pairs, and energy transfer and hypochromism in polynucleotides L A Blumenfeld (Moscow), who unfortunately was not present, submitted an abstract on the magnetic and dielectric properties of DNA, and P Douzou (Paris) presented results of experiments on the excitation and emission spectra of purine and pyrimidine bases, the corresponding mononucleotides, polyadenylic acid, DNA and nucleoproteins

The third session was entitled "Chemical Sequence and Heterogeneity", and commenced with a presentation by B. Horecker (New York) of some recent results of Hurwitz and his collaborators on the DNA-requiring system for polyribonucleotide biosynthesis In this system, the base composition of the newly formed polyribonucleotide appears to be determined by that of the DNA primer J Marmur (Brandeis University) described in some detail work on strand separation in DNA, on the recombination of strands and on the formation of hybrid chains A system capable of the non-enzymic synthesis of polydeoxyribonucleotides from mono- and oligo-nucleotides present in deoxyribonuclease digests of DNA was described by A Bendich (New York)

"Enzymic Synthesis of DNA" was the title of the fourth session, which was opened by a paper from R M. S Smellie (Glasgow) on the properties and intracellular location of the DNA polymerase in certain mammalian systems and on some possible mechanisms of control of the biosynthesis of DNA This was followed by a presentation by J A V Butler (London), who described some experiments on the phosphorylation of thymidine by tissue extracts and on the incorporation of labelled thymidine into DNA S S Cohen (University of Pennsylvania) discussed the changes in enzyme complement of bacteria infected with *T*-even bacteriophage, and referred in particular to the appearance of an active system which converts ribonucleotides to deoxyribonucleotides Some recent work on the mechanism of replication of bacteriophage φ*X*174 were described by R. L Sinsheimer (Pasadena), from which it seems that on infection a replicative form of DNA is produced which has characteristics of a double-stranded DNA

The fifth and sixth sessions dealt with "Induced Changes in DNA" R Litman (University of Colorado) discussed the effects of ultra-violet irradiation and nitrous acid on pneumococcal-transforming DNA, and the chemical and biological effects of nitrous acid and hydroxylamine on DNA from tobacco mosaic virus and *T*-even bacteriophages were described by H. Schuster and W Vielmetter (Tubingen) P D Lawley (London) reported on the effects of alkylating agents on DNA The relative reactivities of the different bases in DNA were described and the possibilities of cross-linking in the DNA molecule were discussed Experiments directed towards elucidating the mechanism of action of succinic peroxide on DNA by chemical, physico-chemical and biological procedures were discussed by D Luzzati (Strasbourg) G Stent (Berkeley) discussed the susceptibility to mutagenesis by 5-bromodeoxyuridine and the stabilization to phosphorus-32 decay-inactivation of *T*4 bacteriophage-infected bacteria D Shugar (Warsaw) was unable to attend the meeting, but submitted an abstract dealing with the primary effects of ultra-violet radiation on nucleic acids; these include hydration and dimerization of pyrimidine residues An additional paper on the dimerization of thymine by ultra-violet radiations was presented by W Berends (Pays Bas) R Latarjet (Paris) described recent investigations on the action of X-rays on pyrimidine bases in aqueous solution with the formation of hydroperoxides, and some work on the lethal effects of radioactive decay in bacteria after labelling of the DNA in different sites with phosphorus-32, carbon-14 and tritium W Harm (Cologne) discussed the reactivation of bacteriophage following inactivation by exposure to ultra-violet light and divided the reactions into two principal classes, namely, 'recombinative reactivation' and 'true repair mechanisms'

The seventh session was concerned with "Code and Replication" A Garen (Philadelphia) described alterations in alkaline phosphatase resulting from mutations, and J Weigle and F Stahl (Pasadena) discussed chromosome breakage and genetic recombination in bacteriophage λ and the role of duplication in recombination

"Genetic Aspects" provided the subject of the final session of the symposium L Grossman (Brandeis University) presented some work on the chemistry and antigenecity of DNA from *T*2, *T*4 and *T*6 bacteriophage Thermally denatured DNA from these bacteriophages will react with antibodies in the antisera of rabbits immunized with the respective ruptured bacteriophage, but native or renatured DNA shows little reactivity H Ephrussi-Taylor (Paris) described a study of recombination at the molecular level in bacterial transformations and F Jacob and F Gros (Paris) discussed the regulation and mode of action of genes The role of messenger RNA in these reactions was also discussed The final paper of the session was delivered by R Herriott (Baltimore), who described experiments on the annealing of mixtures of transforming DNAs

The timing of the meeting was such as to allow for plenty of discussion during each session, and advantage was taken of this by many of the participants with the result that lively and valuable discussions followed most of the presentations In every respect this was a highly successful meeting and the organizing committee of the Société de Chimie Physique is to be congratulated on the arrangements

R M S SMELLIE

QUANTITATIVE BIOLOGY

AN informal symposium on "Quantitative Biology", at which sixty biochemists, biophysicists and biologists met to discuss their common problems, was held at the Dominion Physical Laboratory, Lower Hutt, New Zealand, on May 12 The meeting was arranged by the biophysicists, who felt that New Zealand workers in these fields had insufficient opportunity to get together The enthusiastic response and the success of the meeting showed how general this feeling must have been

In the morning session of the symposium the hosts introduced their own work Dr M C Probine, who is measuring the physical properties of the primary wall of plant cells, showed how changes in the shape of growing *Nitella* cells could be predicted from the initial orientation of the reinforcing microfibrils and the elastic and plastic properties of the wall Dr K J McCree discussed his programme for measuring the photoconductivity of oriented monolayers of organic materials, produced by the Langmuir technique Mr M A Collins described his electron-spin-resonance spectrometer, and demonstrated the signals of free radicals occurring naturally in coal and those produced by the γ-irradiation of cellulose The spectrometer will also be used to study the physics of photosynthesis, in conjunction with the photoconductivity experiments

Some striking electron micrographs of the wax on the surfaces of clover leaves were exhibited by Mr D M Hall They showed how the pattern varied with the species of clover, and how the wax could be removed by the rubbing together of leaves in a high wind Mr W S Bertraud described the changes in the components of the spermatid cells of the cave weta (*Pachyrhamma fascifer*) which took place during spermiogenesis

In the afternoon, Dr E G Bollard, of the Fruit Research Division, Department of Scientific and Industrial Research, described the utilization of various organic nitrogen compounds as sole sources of nitrogen, in the sterile culture of *Neurospora*, *Chlorella*, *Spirodela* and carrot root tissue He was followed by Dr R E F Matthews, of the Plant Diseases Division, who had found (working with

Dr R I B Francki) that the uracil analogue 2-thiouracil had very different effects on the rod-shaped tobacco mosaic virus and on the spherical turnip yellow mosaic virus After tea, Dr G A Nicholls, of New Zealand Forest Products, Ltd , took his audience on an illustrated tour of his firm's plant, and discussed the work of his laboratory in the fields of bark utilization, pulping, bleaching and turpentine refining Dr A T Wilson, of Victoria University of Wellington, then wound up the proceedings with a highly entertaining exposition of his theories on the physical system in which life may have originated

In the discussion of the way in which future meetings should be organized, there was general agreement that they should be kept as informal as possible, so that ideas could be aired and discussed before they had reached the stage of publication It was also agreed that the meetings should be held at various laboratories in turn, so that in time everyone would have a first-hand knowledge of what everyone else was doing Of the various time-intervals which were suggested, a year was most favoured, and Drs McCree and Probine were asked to handle the arrangements for the next meeting

K J McCREE

MEDICAL RESEARCH IN THE BRITISH CARIBBEAN

THE sixth scientific meeting of the Standing Advisory Committee for Medical Research in the British Caribbean was held at the Marine Hotel, Bridgetown, Barbados, during April 10–13. Thirty-eight communications were delivered, and six were read by title only Chairmen for the five sessions were Sir Harold Himsworth, Prof T H Weller, Prof. A C Frazer, Dr E T C Spooner and Prof. E K Cruickshank

The meeting was remarkable for the high standard of presentation, the diversity of subject-matter, and for the evidence which it offered of the stimulating effect of a research interest on all fields of medicine and its ancillary professions The theme of the meeting—the impact of research on public health—was chosen to be as nearly all-embracing as possible

R A Irvine, C. Miller and L S Grant (Univ Coll , West Indies) reviewed typhoid infection in Jamaica During the period 1952–59, typhoid fever had affected chiefly the younger age groups, with a relapse-rate of 8 per cent and a case fatality of 5 8 per cent M T Ashcroft (British Guiana) reported a steady decline in fatality of typhoid fever in British Guiana, partly due to improved water supply and partly to the introduction of chloramphenicol treatment C C Nicholson and J M Ritchie (British Guiana) directed attention to imperfections still remaining in British Guiana water supplies E H Back and S E Brooks (Univ Coll , West Indies) analysed 134 cases of gastroenteritis in infants admitted to University College Hospital, Jamaica, and discussed prognosis F C Ramsey (Barbados) described scarlet fever in Barbados, suggesting that the disease is less rare than it is said to have been G Bras, D Watler and S E Brooks (Univ Coll , West Indies) quoted figures from the Cancer Registry at University College Hospital to show that carcinoma of the cervix in Jamaica is responsible for more than 30 per cent of all malignancy in females J D Arneaud (Trinidad) discussed drug resistance of tubercle bacilli isolated in Trinidad K D B Charles (Jamaica) and L S Grant (Univ. Coll , West Indies) reviewed poliomyelitis in Jamaica with special reference to the epidemics of 1954, 1957 and 1960 J S R Golding (Univ Coll , West Indies) described the management of those disabled in a moderately severe epidemic of poliomyelitis, and demonstrated the necessity for a planned programme L Spence (Trinidad) gave an account of the distribution of Eastern equine encephalitis virus in Trinidad and British Guiana In Trinidad, the virus has been isolated on six occasions from culicine mosquitoes, and in British Guiana from horses during an outbreak In Trinidad, immunity has been demonstrated in humans, birds and poultry L S. Grant (Univ Coll , West Indies) reported a survey of *Q* fever antibodies in Jamaica, showing that this infection is not at present prevalent W G Downs, L H Turner and A E Green (Trinidad) found 10 per cent of human sera from cases of undiagnosed fever in Trinidad agglutinated leptospiræ, and reported 17 isolations of leptospiræ in culture They directed attention to the lack of knowledge of the local ecology of leptospirosis A V. Wells (St Lucia) described the successful eradication of malaria from St Lucia G Giglioli (British Guiana) discussed the effect of malaria eradication in British Guiana on mortality from chronic nephritis F R S Kellett (Trinidad), as part of the malaria eradication plan in Trinidad, had used 'Baytex' (*S* 29493) as a spray, and showed that this insecticide is effective on various household pests including culicine mosquitoes T H G Aitken (Trinidad) discussed the ecology of *Culex quinquefasciatus* and its importance for public health in the Caribbean area as a vector of filaria, St. Louis encephalitis and Cache Valley fever L M Burke (Jamaica) gave an account of the clinical features of poliomyelitis in Jamaica, as seen in a study of 309 cases admitted to Kingston Public Hospital during 1957–60 J A. S Hall (Jamaica) discussed the role of infection in a series of twenty cases of myelomatosis E H Back and E E DePass (Univ Coll , West Indies) considered rheumatic fever as seen in University College Hospital, Jamaica, during 1952–60, and described the beneficial effect of maintenance benzathine penicillin. F M. McWatt (British Guiana) read an interesting paper on liver cirrhosis in cattle on the savannahs of British Guiana, where three species of *Crotalaria* have been identified The cause of the disease has not been ascertained, but liver biopsies have shown that the fibrosis regresses at certain times of year or when the animals are moved to improved pastures E E Ward and E. H Back (Univ Coll , West Indies) reported work on electrolyte disturbance in infantile gastroenteritis. T Poon-King (Trinidad) gave an important account of electrocardiographic changes observed in patients stung by the Trinidad scorpion, *Tityus trinitatis* The sting of this scorpion produces severe physiological disturbance and sometimes kills. Electrocardiographic abnormalities were found in 39 of 45 patients studied E E Ward (Univ Coll , West Indies) discussed γ-globulin-levels in Jamaicans; he found no racial differences, but levels were higher in those with chronic infections than in the healthy R A Webb (Barbados) analysed 330 first admissions to the Barbados Mental Hospital, in which records of mental ill-health for the whole island have been kept for many years Heredity was revealed as a more important etiological factor than environment K L Standard (Barbados) presented an analysis of child mortality in Barbados, reporting a marked reduction in infant mortality over the past six years Miss G Shaw, L S Grant and A A Peat (Jamaica) gave an account of the statistics of communicable disease in Jamaica up to 1956 K H Uttley (Antigua) discussed mortality from tuberculosis in the negro population of Antigua over the past 100 years B Weinstein (British Guiana) reported a survey of diabetes among residents on the sugar estates of British Guiana He found an overall incidence of 2 04 per cent and discussed etiological factors J Parker-Williams (Univ Coll, West Indies) described a survey of abnormal hæmoglobin in Barbados, with special reference to the sickling gene He compared Barbados with Jamaica in this respect, and discussed genetical implications R J Gourlay (Univ Coll, West Indies) described the incidence of certain worm infestations in Jamaica Miss A Walters and Mrs G Jordan (Barbados), two public health nurses in Barbados, presented a most interesting time-study of the work of public health nurses at three health centres in Barbados, showing that more time was spent on maintenance and records than on the treatment and care of patients ' H M. Beadnell (British Guiana) recounted eight years experience with injuries and workmen's compensation in the sugar estates of British Guiana D O Gore (Univ Coll, West Indies) gave a clinical and pathological account of the portal hypertension produced by 'veno-occlusive disease', and reported on six patients treated by establishing porto-caval shunts F F Laband (Trinidad) gave an account, illustrated with colour slides, of four years experience of oral surgery in the San Fernando General Hospital, Trinidad A G. Leacock and R K Rowley (Barbados) reported the results of repairing inguinal hernias by the 'nylon darn' technique J. A B Jones (Univ Coll., West Indies) discussed some anatomical and pathological abnormalities of the alimentary tract as seen in Jamaica. Winston Adams (British Guiana) gave an account of the control of two malaria outbreaks in the interior of British Guiana, discussed the difficulties of control of *Anopheles darlingi*, the local malaria vector, and mentioned the programme of chloroquinized salt prophylaxis now in operation in this area E L S. Robertson (Trinidad) showed a film demonstrating the surgical treatment of filaria lymphœdema.

Excellent arrangements were made for the meeting by Dr Maurice Byer, director of Medical Services, Barbados, and his staff

HISTORY OF SCIENCES IN ANCIENT AND MEDIEVAL INDIA

A SYMPOSIUM on the "History of Sciences in Ancient and Medieval India" was held during August 4–5 at the Bose Institute, Calcutta, under the auspices of the National Institute of Sciences of India The symposium was inaugurated by Dr D M Bose, director of the Bose Institute In his opening remarks, Dr A C Ukil, convener of the symposium, referred to the importance the study of the history of sciences in India had assumed during recent years and the problems which the workers in the field have to face, especially in connexion with the source materials The discrepancy of knowledge regarding chronology, he observed, constituted a serious difficulty which should engage the attention of the research workers in the subject Regarding the investigations already made, which he termed secondary sources, the attitude taken in the past and points of view expressed required in many instances to be re-examined and re-evaluated

Thirty-five papers were received for the symposium of which twenty-three were read and discussed In his paper on the social and international relations in the development of science, Dr R. C Majumdar pointed out that there is direct evidence to show that scholars from India visited Western countries and taught the people there medical science, astrology, astronomy, algebra and arithmetic as known to India and also indirect evidence of international exchange of scientific knowledge between India and foreign countries European scholars have generally held that in scientific matters it was India that must have borrowed from Western countries But with the advance in knowledge of history, he observed, it was difficult to subscribe to this view of one-way traffic This observation was further substantiated in the paper by Sri S N Sen, who furnished archæological and epigraphic examples and also case-histories such as the transmission of the knowledge of the decimal place-value notation, and some medical and astronomical ideas.

In biology, health and medicine, Dr N. H. Keswani discussed the concepts of generation, reproduction, evolution and human development as found in the writings of Indian scholars of the ancient and medieval period He noted that the results of their observations, unaided by microscopes and modern appliances, approached in accuracy those of modern work, especially in the field of embryology Zoological knowledge in the works of Kālidāsa formed the subject of two papers by Sri C S. Gupta and Sri B Rama Rao, while Dr S S. Misra gave a review of the development of medical sciences in India.

On Indian chemistry, Dr B V. Subbarayappa's paper dealing with Indian atomism showed independent development of the atomic concept of matter in the Hindu, Buddhist and Jaina literature and the difference between the Indian ideas and those propounded by the Greek scholars headed by Democritus and Leucippus Dr S P Raychaudhuri and Dr A K Bhattacharyya dealt with the agricultural practices and soil science in ancient India

The geographical ideas of the Hindus were presented by Dr S M Ali. Besides these were the discussions on the development of mathematical series in India after Bhāskara II, Bhāskara's works on differential and integral calculus, science and society in the Arthaśāstra and the Rāmāyana, and the general scientific contents in the Vedic literature S N S

TELEVISION FOR SCHOOL SCIENCE

THE economic strength of Western Europe depends increasingly on the application of science and technology and, consequently, on a growing supply of scientific and technical manpower. Unfortunately, there is a growing shortage of teachers and schools are already overburdened. School television could perhaps be of considerable assistance in overcoming such deficiencies in educational facilities. The medium has proved effective in various countries, including France, Italy, the United Kingdom and the United States of America, while its scope has been considerably extended by recent technical developments such as the use of closed-circuit systems. A year ago, the Organization for European Economic Co-operation, believing that much could be gained from the experience of countries which had been exploiting the new medium for teaching science subjects, conducted a survey on the present status of school television in Western Europe, and convened a forum of international experts in this field, "Teaching through Television", during June 1960. The report of this meeting is now available*.

The seminar was held at Ashridge (Nr Berkhamsted), with three main objectives: to give countries beginning educational television an opportunity to learn from the experience of those where educational television has been in operation for some years, to encourage the development of international contacts, on a personal basis, between programme producers and to seek ways and means to secure improved co-ordination in securing sources of information on programme material. Two different tendencies emerged during the conference: the use of school television as a complete substitute for traditional teaching (this is the case with the 'Telescuola' in Italy, where there is a severe shortage of teachers and schools) or as a complementary broadcast for use in the framework of normal school activities. School television is also used for teachers' training, as, for example, in the 'continental classroom' of the United States.

Other topics included technical aspects of programme-production problems, the use of films, of consultants, advisers and specialists, of economical visual techniques and devices. Future developments were concerned chiefly with the use of closed-circuit television. Great progress has been made in the development of inexpensive systems which can be used to link any number of classrooms (or even schools) to a central school studio from which live or recorded lessons are 'piped' to pupil audiences. During the seminar it became clear that great possibilities exist for the exchange of information on films and other material and the international exchange of production facilities and personnel.

The report also provides information about the Tele-Lille mathematics experimental project, lists of films available for educational television, examples of science programmes, and a list of scientific film associations and their addresses. A small group has been set up to carry out the recommendations (improved information, training school science producers, research, experimental projects, co-operation with industries) of the seminar. It will report progress to the Organization for European Economic Co-operation and ensure liaison with organizations concerned with science teaching, films and television.

THE INSTITUTE FOR THE ENCOURAGEMENT OF SCIENTIFIC RESEARCH IN INDUSTRY AND AGRICULTURE, BRUSSELS

THE annual report of the Institute for the Encouragement of Scientific Research in Industry and Agriculture, Brussels, for 1960* records sixty subsidies, totalling 264,772,837 francs, during the year, including 3 million francs to the Committee for the Study and Exploitation of Electronic Computers, and estimates that 267 research workers and 529 technicians are thereby employed. The National Centre for Metallurgical Research received 29,275,000 francs for analytical research, investigations on the physical metallurgy of steel, analytical research on the physical metallurgy of zinc, research on the agglomeration of minerals, etc., while the Belgian Society for Nitrogen and Chemical Products, of Marly, received 25,898,000 for research on the pyrolysis of hydrocarbons, on the synthesis of vinyl chloride and other investigations in the field of heterogeneous catalysis.

The Committee for Mapping the Soils and Vegetation of Belgium received a grant of 20,155,000 francs for its systematic study of the pedological character of the soils and towards the pedological map of Belgium, while grants of 10,000,000 francs and 8,560,000 francs went to the Centre for the Study of High Polymers for its work on high polymers and their degradation, on photopolymerization initiated by silver salts and the stability of the polymers and for some industrial work on the extrusion of crystallizable polymers. The Centre of Applied Electronics received 12,450,000 francs for work on passive circuits, on amplifiers, modulators and oscillators of transistors and on industrial circuits, 11,505,000 francs went to the Committee for the Study of Diseases and Feeding of Farm Animals, 9,950,000 francs to the Centre for Scientific and Technical Research of the Metal Manufacturing Industry for investigations on the adaptation of numerical techniques to other machine tools and in automation, as well as 2,980,000 francs for research on resistance to fatigue of cooled alloys, etc., 8,317,590 francs to the National Centre of Metallurgical Research for low-temperature furnace research, and 7,474,273 francs to the Scientific and Technical Centre of the Belgian Textile Industry for research on wool, cotton,

* Institut pour l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture. Rapport Annuel Exercice, 1960. Pp. 255. (Bruxelles: Institut pour l'Encouragement de la Recherche Scientifique dans l'Industrie et l'Agriculture, 1961.)

jute, linen and rayon, as well as 1,534,000 francs for investigations of the utilization of acrylic fibres.

A grant of 7,050,000 francs went to the Committee for the Study of the Solid State for continuation of work on the mechanism of photographic processes and of sensitization; 6,520,000 francs to the National Committee for the Study of Fruit Cultivation, 5,360,000 francs to the Committee for the Scientific and Technical Study of Milk and its Derivatives, 4,300,000 francs to the National Centre for Research on Herbage and Forage for botanical, phytosociological and ecological studies on herbage and on the control of adventitious plants of the prairies, 4,050,000 francs to the Centre for Scientific and Technical Research on the Conservation of Vegetables, and 3,817,000 francs to the Belgian Centre for the Study and Documentation of Water, for studies on water supply, corrosion, residual water, and on atmospheric corrosion

The Belgian Institute of High Polymers received a grant of 3,710,000 francs towards its experimental thermodynamic work at high pressures on the inhibition of the explosiveness of acetylene, the Centre for Studies and Research in Agriculture, 3,590,000 francs for research on cultivation in mineral substrates and on the mineral requirements of vegetables, the Scientific and Technical Centre of the Brewing, Malt and Related Industries, 3,316,000 francs, and the Committee for the Study of the Structure of the Soil, 3,000,000 francs Among other grants may be mentioned 2,770,000 francs for studies on diseases of cereals, 2,280,000 francs for ceramic research, 2,125,000 francs for research on the synthesis of saturated heterocyclic amines substituted in position 3 or 4; 2,065,000 francs for phytovirological research, 2,049,500 francs for research on paints, varnishes and printing inks, 2,040,000 francs for studies on the creep of metals at high temperatures, 2,000,000 francs for work on new penicillins and the new antibiotic, staphylomycin, and 1,840,000 francs for research on the culture of medicinal plants

HELICOPTER STATIONS IN LONDON

IN July 1959, the Minister of Transport and Civil Aviation formed a committee to consider the setting up of helicopter stations in the London area, assuming (1) that the helicopter is developed to the point of offering sufficiently low fares on regular services to attract large numbers of passengers for inter-city flights on international routes and possibly internal ones as well, (2) that the helicopter will not offer fares sufficiently low for mass travel, but will meet the needs of small numbers of travellers for whom the extra time saved is more important than the money spent

In its recommendations*, the Committee assumes that regular services between London and the near Continental cities with helicopters carrying twenty-five passengers or more will begin in 1965, or soon after, that fares will be offered approximating those of first-class 'fixed-wing' services, and that services to provincial cities in the United Kingdom will follow if fares can be reduced to compete with those of the other forms of transport

Allowing for executive and charter flights with passengers, freight and mail as well as regular services, the total traffic could amount to 20–25 helicopter movements in a peak hour, with a mixture of single- and multi-engined types by 1975, when the heliport would have to handle 1½ million passengers a year These estimates, the committee suggests, represent a reasonable basis for planning the area required for the first permanent heliport

In order to provide enough space for helicopters to land and take-off and for working stands (for loading, unloading, minor maintenance, etc) at the heliport, a level area of about 8 acres would be required to handle 25 movements an hour In addition, an area of about 4 acres would be needed for terminal buildings and car parks, which, if the landing area were on a raised platform, could be provided on a lower deck or at ground-level

For reasons of air traffic control, the capacity of a heliport could not be increased much beyond 25 movements an hour even by providing an additional landing area, which would involve a disproportionate amount of extra space

The heliport should satisfy the following requirements

(1) Since the appeal of the helicopter depends on saving time, the heliport should be brought as close as possible to the main source and destination of a substantial proportion of the traffic More specifically, it should not be much more than a quarter of an hour from Grosvenor Square, and ideally, between the West End and the City Because of the helicopter's potentialities for freight and mail, nearness to one of the sorting offices of the General Post Office would also be an advantage

(2) It should be conveniently placed for all forms of surface transport, good road connexions and local traffic access being especially important in view of the high proportion of passengers who will travel to the heliport in private cars and taxicabs

(3) It should have sufficient unobstructed approaches to enable operations to continue safely in all weathers, allowing for a climb and descent gradient not much steeper than 1 in 4 This may entail some restriction on building heights in the neighbourhood of the site

(4) To be usable at all by single-engined helicopters it should be beside the River Thames

(5) In order to avoid conflict between helicopter and fixed-wing traffic to and from London Airport, it should not be located farther west than Battersea For effective control of air traffic, it is unlikely that two sites on the Thames within easy reach of the West End could be simultaneously used to capacity

(6) It should be compatible with the proposals of the County of London development plan

(7) It should be so placed as to avoid interference with the normal life and work of the neighbourhood

Measurements of the noise of the various types of helicopters indicate that noise in level flight at 1,000 ft would be no greater than traffic noises in a busy street, but, since it will be more widespread, routes should be chosen which, so far as possible, reduce flights over areas particularly sensitive to noise The greatest noise will be in the immediate locality of the

---

[*] Ministry of Aviation Report of the Committee on the Planning of Helicopter Stations in the London Area Pp 105 (10 plans) (London H M S O , 1961) 7s net

heliport, and within a radius of half a mile of it under the take-off and landing paths

Provided the site is carefully chosen, that is, on the Thames and in an area where the activities are mainly industrial and commercial, the quieter types of turbine-driven helicopter, as well as existing piston-engined types, should be able to use it at moderate frequencies without causing a serious problem Whether the same would apply to high-frequency or night operations remains to be seen Furthermore, tests carried out in open country and over London suggest that interference with television and very-high-frequency broadcasting is unlikely to be serious

A continued effort will be needed to clarify the effects of the noise of helicopters and means of abating it. Research into noise abatement at source is being carried out by Government establishments and manufacturers Meanwhile, proposals for heliport development should be expedited on the basis that noise can and will be brought down to reasonable levels.

After a preliminary survey, nine sites near the River within reasonable range of the West End have been examined and the following locations are considered the most promising Nine Elms, Cannon Street Station, St Katherine Docks

No attempt has been made to assess precisely the cost, since this is a matter for the promoters. The capital cost is likely to run into several millions of pounds, although it may vary considerably between one site and another A single heliport of 12 acres should be capable of handling traffic well into the 1970's, but will not be able to handle all the traffic indefinitely if the helicopter becomes accepted as a means of mass travel The question of a second heliport must be left for a decision until nearer the time when the requirement is seen to emerge

THE RED DEER IN SWEDEN

FROM information furnished by Å Sjostrom, in a bulletin from the Royal School of Forestry in Stockholm, it appears that the red deer in Sweden is now reduced to some 150 animals confined to three relatively isolated localities in the southern province of Skåne*. The paper gives the results of a study conducted over an area of about 740 acres within the Sovdeborg locality, which extends to some 4,300 acres and contains a herd of 30 deer The annual hunting licence allowed the shooting of 5 animals but might be extended to equal the annual increase, which is 8 The area studied contains some 376 acres of Norway spruce plantations and 179 acres of beech forest, to which the deer do a considerable amount of damage, said to be due to a deficiency of certain nutrient elements in their diet A careful assessment is made of the damage, which is caused mainly to trees from 15 to 45 years old, and leads to the conclusion that the cost of producing one red deer is 4,000 kr (£280) In a Danish deer-forest of some 7,200 acres with a head of 60–100 animals, Prof Grøn has estimated that the cost of production of one animal is about 6,700 kr (£465). Among the suggestions for dealing with these remnants of Sweden's original fauna are fencing of plantations—regarded as too expensive, change of tree-species—thought to be a possible solution, use of chemical repellents—regarded as of doubtful and uncertain efficiency and too expensive, heavier shooting—inapplicable in view of the already small number of animals, formation of red deer reserves and, finally, transfer to more suitable localities in natural spruce forests in west and central Sweden One such transfer has already started The interesting proposal is made that a charge of 10 kr (14*s*) per head on every roe deer, for which a shooting licence is required, should be levied. This would bring in about 300,000 kr (£20,800) a year, which would be used to purchase and maintain an area of suitable land where a new and vigorous stock of the Swedish red deer could be built up

O'NYONG-NYONG FEVER: AN EPIDEMIC OF VIRUS DISEASE IN EAST AFRICA

EARLY in 1959 an outbreak of unfamiliar disease appeared in human populations in the north-west corner of Uganda, and spread across the northern half of the country in a south-easterly direction The disease was usually characterized by headache, fever, adenitis and crippling joint pains, frequently followed on about the fourth day by an eruption of an itching rash, mainly on the trunk and arms These symptoms usually persisted for 5–7 days and were generally followed by quick and complete recovery

The clinical, and some of the epidemiological, aspects of the disease were investigated by Dr H Shore, the acting provincial medical officer in the Northern Province of Uganda, who reported that a dengue-like disease was affecting "vast numbers of people, old, young, men, women and children", and provisionally estimated from the rate of attack that at least 25–50 per cent of the population was at risk That all ages were affected led him to suspect a causative agent new to the region This view is supported by the fact that the local African population have coined a new name for the disease in each successive language group in which it has appeared, one of the first of these being 'o'nyong-nyong'

The epidemic advanced steadily on about a 100-mile front for ten months, crossing the Uganda–Kenya border some 300 miles south-east of the original site of the disease in Uganda, in November, 1959 Between December 1959 and February 1960, the epidemic fanned out in the Kano Plains near Kisumu, Kenya It is still active at discontinuous points east, south and west of Lake Victoria From June, the epidemic has been under detailed study by members of the East African Virus Research Institute Staff, in close collaboration with members of the Uganda, Kenya and Tanganyika Medical Departments

In a report*, prepared by J D Gillet, M. C Williams, J. P Woodall, P S. Corbet and J M Ellice, it is shown that the isolation of o'nyong-nyong virus allowed field epidemic studies and attempted transmission work to be followed virologically, and opened the way for quantitative investigations. These support the general epidemiological and vector findings that *Anopheles* species and, in particular, *A. funestus* are responsible for the transmission of o'nyong-nyong fever, but they do not exclude the possibility of transmission by *A. gambiae*. It is thought that this is the first time that a patchy alopecia has been used as an indicator in mice of arthropod-borne virus infection. An attempt has been made to measure three of the variable factors involved in order to gain an understanding of the epidemic. These are the mosquito infection-rate, the inapparent human infection-rate and the period of viræmia. Considerable work will be required before the success or failure of this attempt can be assessed.

A WARNING SYSTEM FOR NUCLEAR ACCIDENTS

RADIOACTIVITY, which was once the practical interest of no more than a few scientists and medical men, is now the daily concern of a great many people in most industrialized communities. Moreover, as events at Windscale demonstrated in Great Britain, radioactivity can be released accidentally in quantities sufficient to affect the life and livelihood of considerable numbers of the general population. With the increasing use of nuclear energy for peaceful purposes, nuclear installations will become more numerous, and, in the event of a nuclear accident, radioactive material might be transmitted over wide areas and across national boundaries.

The decision of the Council of the Organization for European Economic Co-operation* to establish "a supervision and emergency warning system in cases of increase in environmental radioactivity" is therefore an important and encouraging step in international collaboration in the field of nuclear energy. The main purpose of the supervision and emergency warning system is to facilitate and improve health protection measures in the event of a substantial increase of radioactivity in any member country of the Organization for European Economic Co-operation by immediately notifying it to the responsible authorities in the other member countries. The transmission of information is to be governed by three criteria: (1) health protection in the event of a nuclear incident; (2) health aspects of an increase in environmental radioactivity of undefined origin; and (3) scientific interest of any case of abnormal increase in environmental radioactivity. As monitoring stations for measuring airborne radioactive material are already in existence in all member countries of the Organization the proposed system is to be based at first on air monitoring, although the importance of water and dietary contamination is recognized, and extension of the system to these fields of monitoring is envisaged at a later stage.

The three levels of artificial total β-radioactivity in air, given as a basis for determining the categories of increase in radioactivity, are: (1) an 'emergency' level of the order of 1,000 $\mu\mu$c./m.^{3}; (2) a 'pre-emergency' level of the order of 100 $\mu\mu$c./m.^{3}; and (3) a level of 'scientific interest', set at ten times higher than the previous monthly average and exceeding the value of 5 $\mu\mu$c./m.^{3}. The levels are averages over one day, the 'emergency' level being determined in relation to possible nuclear incidents and regarded as valid for emergencies of short duration. Very approximately in terms of the Windscale reactor accident, the 'emergency' level corresponds to that observed within 50 miles (downwind) of Windscale itself, the 'pre-emergency' level to radioactivities observed at that time in Devon, and the level of 'scientific interest' to observations made at some places on continental Europe. It should be noted that the warning-levels are those of artificial β-radioactivity, and that average levels of natural β-activity in the air in Great Britain are typically of the order of 100 $\mu\mu$c./m.^{3}.

An administrative organization is laid down, and reports are to be made to the European Nuclear Energy Agency as well as to the "designated authorities" in the member countries. After an initial period of two years operation, the Steering Committee for Nuclear Energy is to make a report to the Council of the Organization for European Economic Co-operation on the way the system has worked.

Perhaps the most important aspect of the scheme is that it represents the beginning of collective action on a problem which transcends national boundaries, and that, as the Steering Committee itself suggests, "when the supervision and warning system is set up, the possibilities of more extensive international collaboration should be considered". There would appear to be no insuperable difficulties to complete international collaboration on this aspect of the peaceful uses of nuclear energy.

MOLECULAR DISARRAY IN A CRYSTAL LATTICE PRODUCED BY A FISSION FRAGMENT

By DR. F. P. BOWDEN, C.B.E., F.R.S., and L. T. CHADDERTON

Physics and Chemistry of Solids, Cavendish Laboratory, Cambridge

IT should be possible, if we choose an appropriate crystal, to observe directly in the electron microscope the lattice disarray caused by the passage of a fission fragment, and an attempt has been made to do this. The first observations of crystal lattices and associated defects were made by Menter[1] with phthalocyanine and its metal derivatives. These are polycyclic hydrocarbons with large flat molecules and the shape of the molecule influences the mode of crystallization. Platinum phthalocyanine, for example, crystallizes in the monoclinic form[2] as long flat needles and with a large unit cell ($a_0 = 23{\cdot}9$ Å., $b_0 = 3{\cdot}81$ Å., $c_0 = 16{\cdot}9$ Å., $\beta = 129{\cdot}6$ Å.). It is this property, in addition to the fact that the platinum atom, a heavy scatterer of electron waves, lies in the centre of the molecule, which facilitates the direct observation of (20$\bar{1}$) lattice planes, separated by 11·94 Å., in the electron microscope. In a carefully aligned electron microscope with a nominal resolving power of 'better than 10 Å.', transmission electron micrographs of thin unstrained crystals of platinum phthalocyanine possess parallel fringes the separation[3,4] and direction[5] of which correspond to (20$\bar{1}$) lattice planes in the crystal structure. The experimental detail so far is in full accord with the only extensive theoretical analyses published[6,7].

Platinum phthalocyanine was prepared from platinous chloride and phthalonitrile[8] and purified by repeated vacuum sublimation. Crystalline specimens suitable for the electron microscope examination were obtained in two ways. The first method involved simple mechanical grinding of the pure crystals, a drop of a suspension in ethyl alcohol being allowed to evaporate from a perforated carbon film on a copper electron microscope specimen grid. The second method, by far the more successful, consisted of condensing the crystals directly on to the support films from the vapour phase[9]. Crystals varying in thickness from some 40 Å. upwards could thus be prepared at will. Specimen grids were placed in contact with thin foils of natural uranium and irradiated with thermal neutrons in the experimental reactor *Bepo* at the Atomic Energy Research Establishment, Harwell, for periods of 5 min.–20 hr. at a pile factor of 12. After a few weeks the specimens irradiated with fission fragments and thermal neutrons were safe enough to handle and were examined in transmission at high magnification in a Siemens Elmiskop I electron microscope. Crystals which were not placed in contact with natural uranium foil, and which consequently suffered neutron irradiation only, were also examined.

In electron micrographs taken in transmission at low beam intensities with exposure times of up to 30 sec., the platinum phthalocyanine crystals show tracks and spots about 100 Å. in diameter. These can be attributed unambiguously to individual fission fragments, since they do not appear in crystals irradiated with thermal neutrons only and since their number correlates with that calculated from dose considerations. The tracks, which are sometimes dashed and which sometimes have an alternating light and dark contrast, would appear to result from fission fragments which are travelling at an oblique angle, or almost parallel, to the plane of the crystal. The spots, however, have a light contrast on a dark background and these may be attributed to fission fragments travelling at a high angle or perpendicular to the plane of the crystal. We shall consider here the damage due to particles such as these which pass normally through crystals about 100 Å. thick in a direction roughly parallel with the (20$\bar{1}$) planes.

Figs. 1 and 2 show what can happen to the (20$\bar{1}$) fringes when the damage is in the main body of the crystal. In Fig. 1, for example, the regular lattice is disordered and there is a roughly circular diffuse region which extends over about 80 Å. Close to the edge of the diffuse region the (20$\bar{1}$) fringes curve inwards towards the disordered region : this is shown in the adjoining diagram. In Fig. 2, however, the

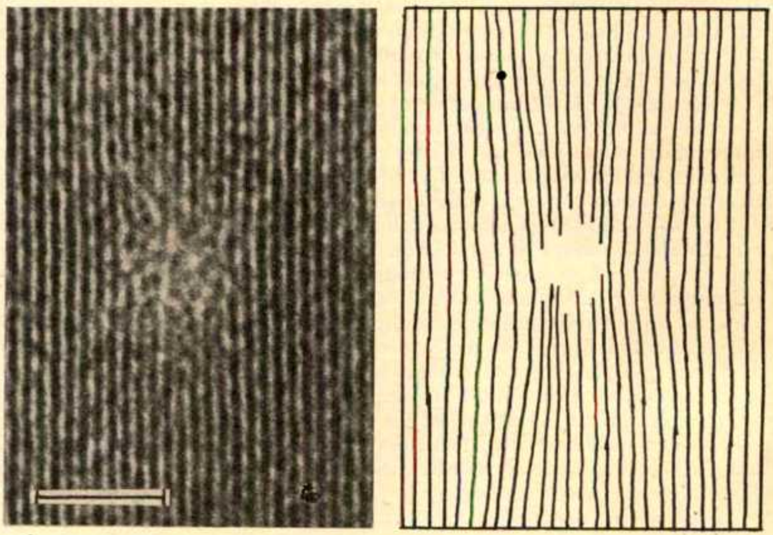

Fig. 1. Electron micrograph of a platinum phthalocyanine crystal showing the molecular disarray when a fission fragment travels perpendicular to the projection of the (20$\bar{1}$) planes and within the main body of the crystal. The drawing illustrates the situation more clearly. Scale, 100 Å.

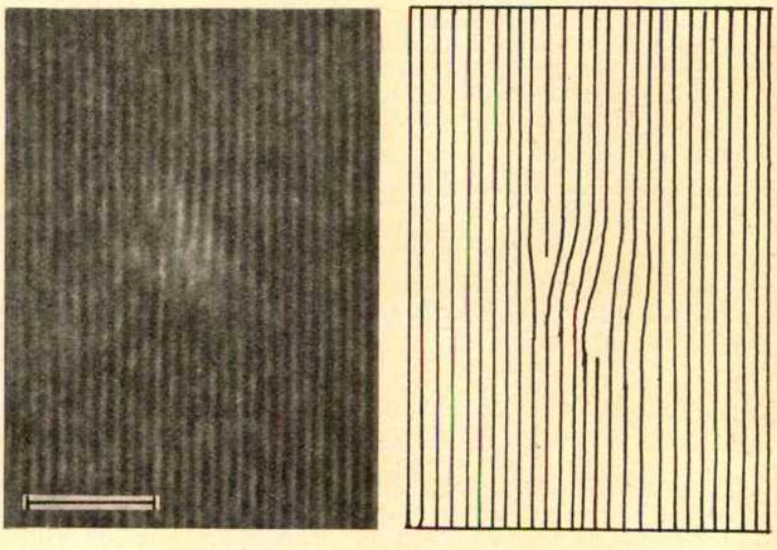

Fig. 2. Electron micrograph of a platinum phthalocyanine crystal showing damage sustained when a fission fragment travels perpendicular to the projection of the (20$\bar{1}$) planes and within the main body of the crystal. A dislocation dipole results. Scale, 100 Å.

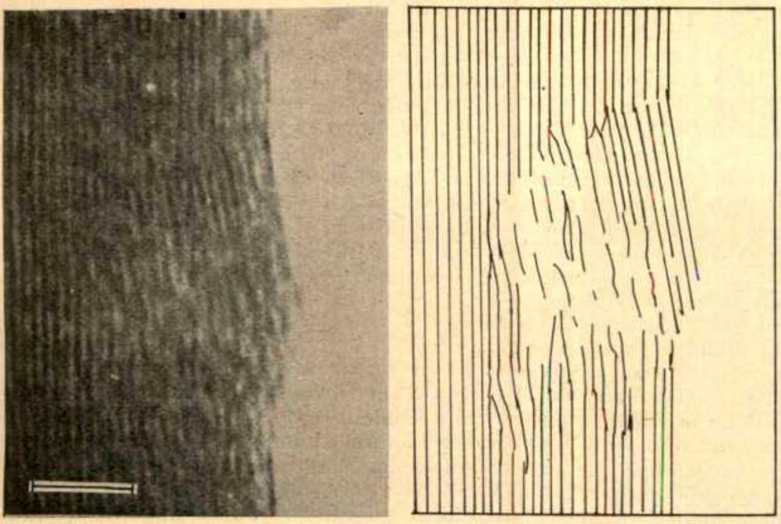

Fig. 3. Electron micrograph of a platinum phthalocyanine crystal showing damage sustained when a fission fragment strikes a crystal edge. Scale, 100 Å.

picture is quite different. Instead of a diffuse region the fringes are resolved clearly over the damaged area. Although those bordering this area are again curved, the reason for this is apparent ; it will be seen that there are two fringes which terminate abruptly within the area of damage.

When the fission fragment penetrates the crystal close to one of its parallel edges, the damage is very much greater in extent. This is illustrated in Fig. 3.

If we assume that fringe patterns obtained with platinum phthalocyanine crystals in the electron microscope represent in some measure the behaviour of the $(20\bar{1})$ molecular planes (and for thin crystals the approximation is a good one[6]), then certain conclusions can be drawn from the above observations. In the first instance, a measure of the extent of the damage due to a fast-moving fission fragment is obtained. In the body of the bombarded crystal the diameter of the damaged region caused by one nuclear fragment varies between 80 and 120 Å. (that is, between 7 and 10 molecular planes). In Fig. 3, however, at a crystal edge, the appropriate figure is nearer 250 Å. The perfection of the $(20\bar{1})$ lattice planes is destroyed over this region and close to it there is evidence for a curvature of the molecular planes. An interesting conclusion may be derived from Fig. 2. It has been emphasized that a terminating half-fringe is not to be interpreted as a terminating half-plane, that is, an edge dislocation of Burgers vector $(20\bar{1})$[10]. On the contrary, we can only infer that a dislocation of quite general character, with both screw and edge components, passes from the top to the bottom surface of the crystal. In Fig. 2, however, a Burgers circuit traced around the damaged region closes completely, and indeed we might have expected this since we started with a perfect lattice. It would seem that the effect of the fission fragment on the lattice has been the introduction of two dislocations of quite general character but of opposite polarity. The concept of the dislocation dipole is not entirely new—Bollman[11] has recently shown, using moiré fringe techniques, that dislocation dipoles may be present in neutron-irradiated graphite.

The energy of a fission fragment at birth is about 100 MeV. and the atomic weight may be anywhere between 72 and 161. Thus we are dealing with very fast moving particles ($\sim 10^9$ cm./sec.) and so the fragments have high charges ($\sim 18e$). It can be deduced, using a value of 1·70 eV. (Chadderton, L. T., unpublished work) for the low-energy limit of the main optical absorption band, that loss of energy by

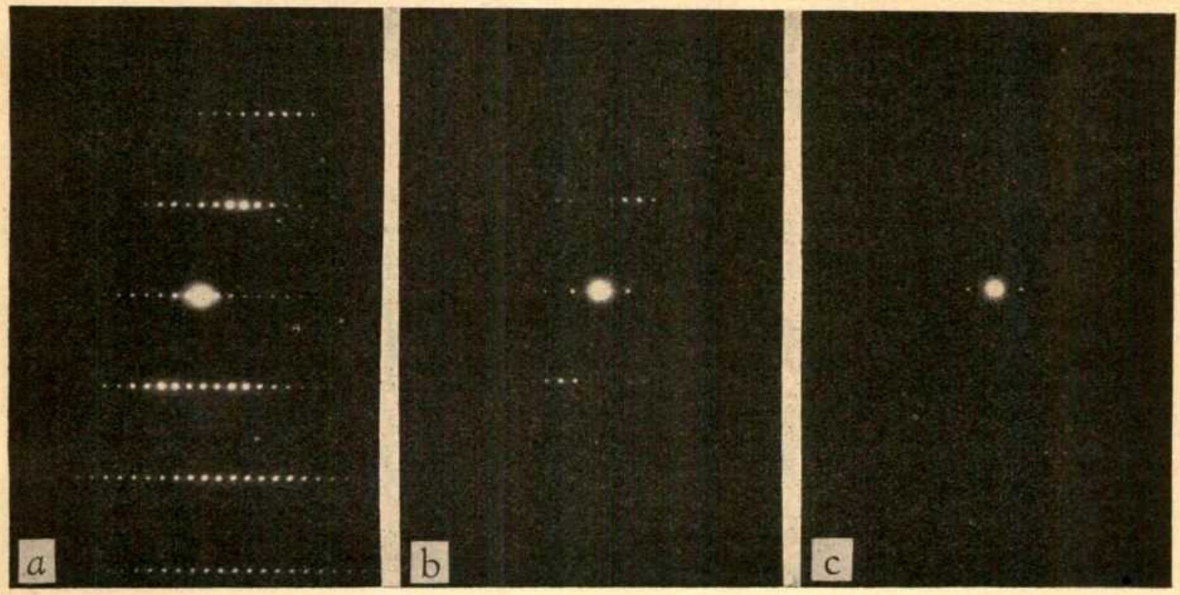

Fig. 4. Changes in the electron diffraction pattern from a thin single crystal of platinum phthalocyanine after irradiation with electrons at high magnification and low beam intensity : (*a*) after 40 sec.; (*b*) after 80 sec. ; (*c*) after 120 sec. Apparently the platinum atoms remain roughly in their original positions

ionization[13] exceeds that due to elastic collisions by a large factor. The production of primary knock-ons by Rutherford collisions accounts for only about one part in a thousand of the total loss of energy. In such circumstances we may consider the resulting excitation to be a purely thermal temperature spike; the damage arises from the rapid delivery of heat to the lattice by the moving particle. Temperatures exceeding 1,000° C. endure for times in the neighbourhood of 10^{-11} sec., exact values depending on the thermal properties of the lattice. Since platinum phthalocyanine sublimes in air at temperatures above 500° C., it becomes evident that 'evaporation' will occur along the length of the cylindrical track of the moving fragment and that recrystallization, if it takes place, is unlikely to be in perfect register with the undamaged lattice. Bombardment of platinum phthalocyanine with heavy nuclear particles of high velocity and charge may therefore introduce dislocation arrangements into an initially perfect crystal. Other authors have examined the damage produced by fission fragments in mica[13-14], uranium oxide[15,16], and graphite[17], but without the assistance of direct lattice observations. Bowden and Montagu-Pollock have described the damage produced by a fission fragment in an explosive crystal[18].

Effect of Electron Bombardment

One important factor has been so far omitted, namely, the effect of the electron waves on the crystal while it is being examined and photographed in the electron microscope. The electrons themselves constitute a radiation capable of producing considerable damage to the lattice since they are accelerated to relativistic velocities by a high voltage of 80 kV. Their effect has been investigated with the assistance of the electron micro-diffraction device, whereby changes in crystal structure can be examined as irradiation with electrons proceeds. Fig. 4 shows what happens to the diffraction pattern from a single crystal of platinum phthalocyanine while it is being irradiated with electrons at a low beam intensity. A fringe pattern is obtainable from the crystal throughout the irradiation, but its nature and origin change. In the first instance the pattern is derived from the $(20\bar{1})$ molecular planes, but as the cumulative electron dose on the specimen builds up the crystal structure changes. All order in the lattice (except that which gives rise to the $(20\bar{1})$ and $(\bar{2}01)$ spots in the diffraction pattern) disappears and the resulting fringe pattern observed in bright-field electron micrographs becomes much smoother. It would appear that although the large organo-metallic molecules are being destroyed, the platinum atoms remain roughly in their original positions in the $(20\bar{1})$ planes, embedded in a matrix of carbonaceous matter. The information derived from fission fragment bombarded crystals is, however, not affected by these considerations, since the electron micrographs were taken before decomposition by electron irradiation had proceeded to any marked extent.

Conclusion

We see that it is possible to make a direct observation of the molecular disarray produced in a crystal lattice when a single fission fragment passes through it. The extent of the damage can be measured to within one molecular plane and in platinum phthalocyanine varies between seven and twenty $(20\bar{1})$ planes, being dependent on where, and at what angle, the fragment strikes the crystal. In some cases dislocation dipoles are formed. The method appears to be a perceptive one for studying the detailed mechanisms of radiation damage.

ELECTRON-SPIN RESONANCE SIGNALS FROM LYOPHILIZED BACTERIAL CELLS EXPOSED TO OXYGEN

By DR. M. B. LION*, DR. J. S. KIRBY-SMITH and DR. M. L. RANDOLPH

Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee

ESCHERICHIA COLI cells, lyophilized from distilled water, lose their viability very rapidly when exposed to oxygen, but not when kept in vacuum[1]. Certain aspects of these observations suggested that free radicals might be involved in this phenomenon. An investigation of electron-spin resonance was therefore undertaken. The details of the spectrometer have been described[2,3]. An associated analogue computer enabled the determination of the number of magnetic centres in the sample as compared with the diphenylpicrylhydrazyl (DPPH) standard[4].

Cells of *E. coli* strain *B/r* were grown on nutrient agar and, after collection, were washed and resuspended in distilled water. About 2 × 10^{11} cells were lyophilized in each ampoule. An electron-spin resonance sample tube (diameter 5 mm.) was sealed to each ampoule as a side arm. After completion of the lyophilization the samples were either sealed off under vacuum or filled with dried oxygen and then sealed The dry bacterial powder was pulverized by some large-diameter glass beads which had been introduced into the ampoules before lyophilization The powder was then poured into the side arm, which was introduced into the cavity of the spectrometer Fig 1 shows the spectra of two samples of dried cells One had been exposed to oxygen for 2 days while the other remained in vacuum The signal produced in presence of oxygen was apparent 30 min after the beginning of exposure, when the earliest measurement was made, and reached its final height after some hours After reaching a peak no change either in height or shape of the signal occurred for at least 4 months Contrary to experiments performed on lyophilized tissue by Miyagawa *et al*[5], the signal remained stable even after removal of oxygen by re-evacuation, as shown in Fig 2 While heating the lyophilized cells to 100° C for 75 min after exposure to oxygen did not affect the signal obtained (Fig 3, II), the cells heated at 100° C for 5 min before freeze-drying produced a much smaller signal after exposure to oxygen (Fig 3, III)

---

* On leave of absence from the Israel Institute for Biological Research, Nes-Ziona, Israel, which is Dr. Lion's present address.

This behaviour of free-radical signals present after lyophilization with respect to heat and exposure to oxygen differed from radiation-induced resonances Dried bacteria irradiated with 750 kr of X-rays showed a broad, weak, and double-peaked signal which became higher and sharper after heat treatment and rapidly decayed on exposure to oxygen (Fig 4) This change in pattern after heating suggests a heat-induced transition from one radical species to another, and a fundamental difference between radiation-induced radicals and those occurring after lyophilization alone

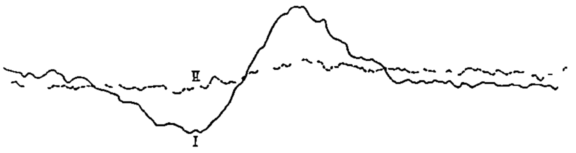

Fig 1 First derivative of electron-spin resonance absorption curve of *E coli* cells lyophilized from distilled water I, 18 mgm exposed to oxygen for 2 days II, 21 mgm kept in vacuum

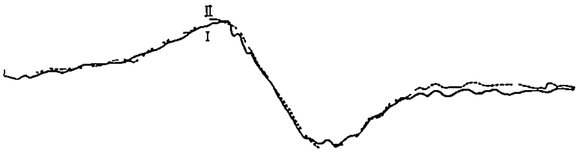

Fig 2 First derivative of electron-spin resonance absorption curve of *E coli* cells lyophilized in distilled water and exposed to oxygen I, before removal of oxygen by re-evacuation, II, after re-evacuation

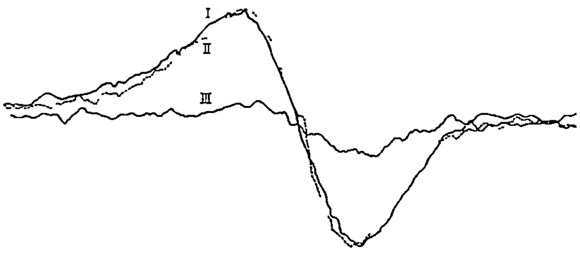

Fig 3 First derivative of absorption curve of *E coli* cells lyophilized from distilled water and exposed to oxygen I, normal cells (60 mgm) II, cells heated to 100° C for 75 min after exposure to oxygen (60 mgm), III, cells heated to 100° C for 5 min before lyophilization (70 mgm)

Dried *E coli* cells may be protected against the lethal effect of oxygen by different substances, as, for example, by thiourea or even more effectively by sodium iodide[6], but cysteine (as hydrochloride partially neutralized to pH 6 0 with sodium hydroxide) is completely ineffective in this respect[6] In a typical experiment the viability of dried cells after exposure to oxygen for 4 hr at 28° C was found to be control, 0 05 per cent, in presence of cysteine, 0 001 per cent, in presence of thiourea, 42 per cent; in presence of sodium iodide, 80 per cent[6]

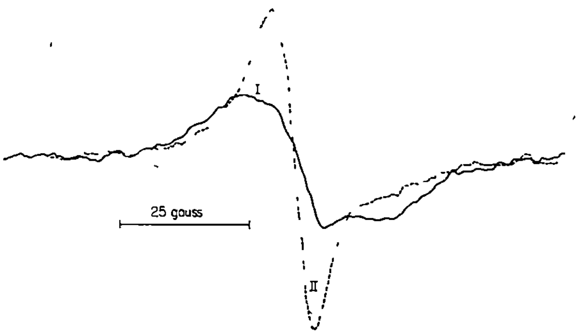

Fig 4 First derivative of absorption curve of *E coli* cells lyophilized and irradiated in vacuum by 750 kr X-rays I, before heating, II, after heating to 100° C for 20 min Spectrometer sensitivity about one-sixth that for other figures All rates of scanning were equal

Measurements of electron-spin resonance were therefore made on dried cells exposed for 2 days to oxygen in the presence of these substances The ampoules were then opened in relative humidity less than 35 per cent, and the fluffy material was rapidly compressed with a glass rod into sample tubes used in measuring electron-spin resonance, thus enabling greater amounts of material to be introduced into the sensitive volume of the cavity The sample tubes were sealed immediately Fig 5 shows the signals produced when dried cells are exposed to oxygen in the presence of cysteine, thiourea, sodium iodide, and no additive Each sample contained 50 mgm of bacterial cells, the additives comprising a further 16–18 mgm A qualitative relationship seems to exist between the ability of these additives to suppress the signal from electron-spin resonance of oxygen-exposed, dried bacterial cells, and their ability to protect these cells against the lethal effect of oxygen

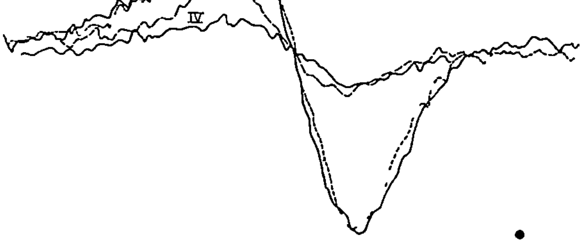

Fig 5 First derivative of absorption curve of *E coli* cells lyophilized and exposed to oxygen for 2 days in presence of I, cysteine, II, no additive (control), III, thiourea, IV, sodium iodide

The approximate number of magnetic centres produced by oxygen in dried bacteria is about 2×10^{16} spins/gm This figure is probably correct only within a factor of two owing to the high gain needed in the detection system of the apparatus with consequent drift and noise when the signals of these materials were determined Since the number of bacterial cells in 1 gm of dry material is roughly 4×10^{12}, the number of free radicals produced for each dry cell reacting with oxygen is about 5,000 Possibly the oxygen reaction is quite specific and involves only few molecular species the normal state of which might be vital to the survival of the cell It also seems that the 'oxygen acceptor' in this reaction is quite heat-sensitive while the reaction product is not

The experiments of Miyagawa *et al*[5] were done on ground, non-viable animal tissues and are therefore not directly comparable with our results They show that molecular species of biological origin which in the dry state are able to react quickly with oxygen are not restricted to bacteria Our results differ in that the reaction between oxygen and the sensitive site of bacteria seems to be irreversible

This last observation would exclude a normal metabolic role for the reaction, for otherwise one might expect a resonance signal in dried bacteria (which are intact and viable cells) kept in vacuum. One might rather imagine that the site sensitive to oxygen is protected in a wet-cell system by the action of normal metabolic machinery in removing excess oxygen. Once this normal machinery is stopped in the dry cell, the site becomes easily accessible to oxygen Unless other protecting materials are present, there follow consequent inactivation and loss of the capability of the cell to recover when it is re-introduced into its normal environment This latter property of the bacterial cell makes it an interesting model for investigating biological phenomena by means of electron-spin resonance

ANGULAR MOMENTUM OF CONTINUA

By Prof J. S DAHLER and Prof L E SCRIVEN
Department of Chemical Engineering, University of Minnesota, Minneapolis

When applied to the continuum model of matter, the principle of conservation of linear momentum becomes Cauchy's law of motion, which in spatial co-ordinates is the familiar equation of change of linear momentum In Cartesian tensor notation, with D/Dt the substantial time derivative and other symbols having their usual meanings

$$\rho \frac{\mathrm{D} V_j}{\mathrm{D}t} = \rho F_j + T_{ij,i} \qquad (1)$$

The stress-tensor can be resolved into symmetrical and anti-symmetrical parts $T^{(s)}_{ij} + T^{(a)}_{ij}$, the second is given by (1/2) $e_{ijk}\ A_k$, where the pseudo-vector $A_k \equiv e_{kmn}\ T_{mn}$ With this resolution, the first moment of equation (1) about an arbitrarily chosen origin is found to be

$$\rho \frac{\mathrm{D}}{\mathrm{D}_t}(e_{kij}\, R_i\ V_j) = \rho\, e_{kij}\, R_i\ F_j + (e_{kij}\, R_i\ T_{lj})_{,l} - A_k \qquad (2)$$

This equation of change of moment of momentum, or external angular momentum, $e_{kij}\, R_i\ V_j$ (per unit mass), shows that quantity to be conserved in the usual sense only when the stress-tensor happens to be symmetrical, for otherwise A_k does not vanish, and the last term represents local consumption (or production) of moment of momentum throughout the system What is the fate of this external angular momentum ?

A system may exchange with its surroundings not only linear but also angular momentum The two classes of interaction need not be wholly equivalent in the case of real materials, although they are so regarded in most traditional continuum models But just as the distant material surroundings may exert locally a vector body force F_j, they may also exert locally on the system a pseudovector body-couple G_j per unit mass and just as the contiguous material surroundings may exert a vector surface traction $T_j = n_i\ T_{ij}$, they may also exert on the surface of the system a pseudovector couple $C_j = n_i\ C_{ij}$ per unit area, where C_{ij} is the couple stress-tensor If the pseudovector L_k denotes the local density of angular momentum per unit mass, the principle of conservation of angular momentum for the constant mass system associated with an arbitrary, convected volume is

$$\frac{\mathrm{d}}{\mathrm{d}t}\int_V \rho L_k \mathrm{d}V = \int_V \rho(e_{kij}R_i F_j + G_k)\mathrm{d}V + \int_S n_l(e_{kij}R_i T_{lj} + C_{lk})\mathrm{d}S \qquad (3)$$

In the usual way this leads directly to the equation of change of total angular momentum

$$\rho \frac{\mathrm{D}L_k}{\mathrm{D}t} = \rho\, e_{kij}\, R_i\ F_j + \rho\, G_k + (e_{kij}\, R_i\ T_{lj})_{,l} + C_{lk,l} \qquad (4)$$

Even more important than this equation is the following, obtained by subtracting equation (2) from equation (4) and denoting as M_k the difference $L_k - e_{kij}\, R_i\ V_j$ between total angular momentum and moment of momentum

$$\rho \frac{\mathrm{D}M_k}{\mathrm{D}t} = \rho\, G_k + C_{lk,l} + A_k \qquad (5)$$

This equation of change of internal angular momentum makes clear the fate of the external angular momenturn it is transmuted to the internal form by the alchemy of an unsymmetrical state of stress After transformation it may be accumulated within the system or removed to the surroundings Just as the body-force is the rate of arrival of linear momentum from distant material surroundings, the body-couple G_k is the rate of arrival of internal angular momentum from the same source, and in a similar analogy the net surface couple $C_{ik,j}$ is the rate of arrival, by diffusion, of internal angular momentum from contiguous material surroundings

So far as we know, equation (5) was first given in complete form in 1959 by Dahler[1], who derived it as a general hydrodynamical equation in the context of a statistical mechanical theory of transport processes in fluids composed of polyatomic molecules In his developments for classical and quantum cases, patterned after the methods of Irving and Kirkwood and of Irving and Zwanzig, a key step (as in the continuum development here) consists of distinguishing interactions of a system with distant from those with contiguous surroundings Somewhat earlier Grad[2] had argued in favour of a version lacking only the body-couple term Much earlier the Cosserats[3] had given another version lacking the accumulation term, long neglected, theirs has been revived in the modern theory of rheology (cf refs 4 and 5) and re-discovered in the theory of elasticity[6] Other incomplete versions have appeared in various contexts, for example, the theories of liquid crystals and of what are called anisotropic fluids[7,8]

The derivation sketched here confirms that equation (5) is a basic law of continuum mechanics fully as general as Cauchy's What are some of its consequences ? In the first place, equations (2) and (5) indicate that moment of momentum and internal angular momentum are separately conserved only when the local state of stress is symmetrical Therefore the usual proof of symmetry fails when there are couple stresses and accumulation of internal angular momentum, as Grad[2] has observed, as well as when there are body couples to be accounted for This implies that whenever the adoption of a continuum model requires averaging over the centres of mass of sub-continuum units having rotational degrees of freedom, the stress-tensor is in general asymmetrical, its asymmetry stemming from the interaction of the centres-of-mass system with an interpenetrating twist or spin system[1] An example is provided by Toupin's theory of the elastic dielectric[4], a farther-reaching one is provided by the new Laval–LeCorre–Raman theory of elasticity[6,9,10] Indeed, equation (5) is a means of joining that theory to extensive researches on nuclear and molecular spin systems in the solid state It suggests, incidentally, a need for directing attention to the angular momentum aspect of magnetism in quantitative descriptions of macroscopic behaviour of not only solids but also fluids and less-well-defined forms of matter As yet, in the physics of fluids there are few examples of antisymmetrical states of stress predicted for polyatomic fluids in general by the statistical mechanical theory, they seem to have been first considered in detail only recently by Ericksen in a theory of certain non-Newtonian fluids[7,8] The complete equation of internal angular momentum, which is basic to any full consideration of such states of stress, merits further attention in rheology, particularly as an aid to understanding non-linear behaviour There might be interesting consequences for the hydrodynamic theory of helium II The possible existence of asymmetrical stress seems to have been overlooked, and perhaps the peculiar system of spin-excitations in that liquid might be more conveniently described in terms of intrinsic angular momentum density and equation (5) than in terms of vorticity singularities The equation does suggest the existence of unexplored effects of interchange between moment of momentum and internal angular momentum in macroscopic systems rotated at high angular velocities

Another consequence of the angular momentum equation is the need it shows for discovering the constitutive relations giving the dependences of antisymmetrical stress, couple stress, and body-couples on a set of independent variables that completely describes the dynamical state This need compels one to recognize that continuum models of real matter must be endowed with point structure, a notion that goes back to Duhem and the Cosserats[3–5] This structure must then be characterized quantitatively Further work on energy and entropy accounting, on constitutive relations, on certain applications to polar fluids, and on consequents for turbulent flow is in progress

We are grateful to Prof W. H Schwartz, of Stanford University, for bringing the most recent papers by Ericksen to our attention

APPLICATION OF PALÆOMAGNETISM TO GEOLOGICAL CORRELATION

By A LAROCHELLE

Geological Survey of Canada

THE Monteregian Hills are formed from the erosional remnants of eight igneous plugs which intrude the Palæozoic sedimentary beds of south-eastern Quebec (Fig 1). Work on these intrusive rocks[1] by a number of geologists has shown that they were derived from a common magmatic source of basic composition

Suggestions have been made[2] to include in the Monteregian Hills series a number of alkaline intrusives which are located outside the immediate area

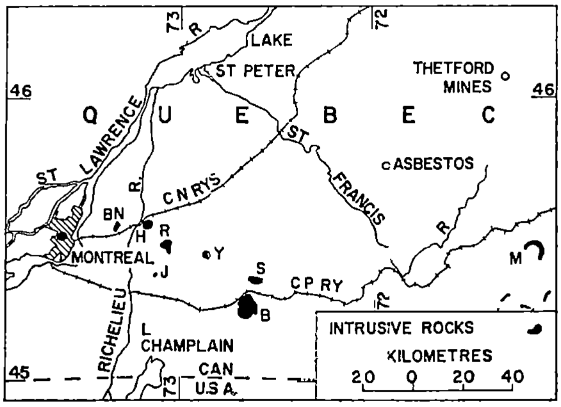

Fig. 1. Areal distribution of Monteregian hills (*BN*, *H*, *R*, *J*, *Y*, *S*, *B*) and Mount Megantic (*M*)

of the Hills. One of these bodies forms the collar of basic rocks on the outer rim of Mount Megantic, some seventy-five miles east of the main group. This body (labelled *M* in Fig. 1) was recently shown (Reid, A. M., unpublished M.Sc. thesis, University of Western Ontario, 1961) to bear petrological affinities with the Monteregian Hills series. The contemporaneity of the Mount Megantic rocks and the Monteregian Hills is suggested in this article on the basis of palæomagnetic data.

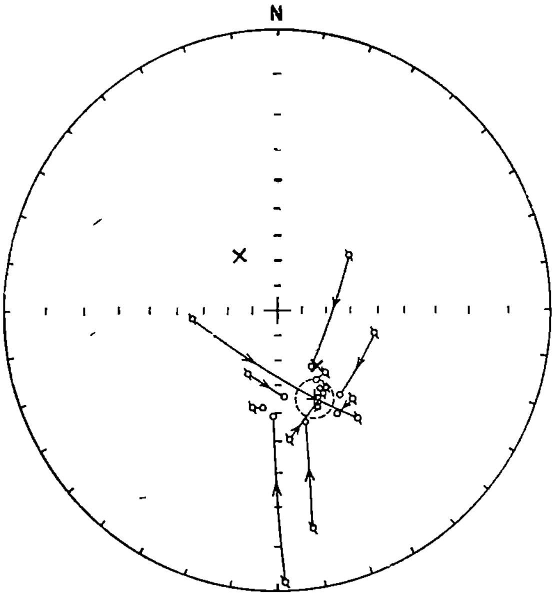

Fig. 2. Directions of magnetization of Mount Megantic rocks. ɸ, original readings; ×, mean direction for other Monteregian hills; ○, after magnetic cleaning; ⊕, circle of confidence and mean direction for Mount Megantic rocks

A suite of twelve oriented specimens was collected from different sections of the basic part of Mount Megantic. For the sampling, a solar compass was used to eliminate the possible error that could be introduced by the interaction of the magnetic needle of an ordinary compass with the relatively strongly magnetic rocks dealt with. Two 1-in. cubes were cut from each specimen and their magnetization directions were measured. The mean direction of magnetization of the two cubes was taken as representative of the specimen. For the purpose of eliminating unstable components of magnetization in the rocks, the latter were then submitted to the action of a decreasing amplitude, alternating field in a magnetic-field-free space. The maximum initial field amplitude used was 250 œrsteds. This treatment improved the clustering of the magnetization directions a considerable amount, as illustrated in Fig. 2.

The mean direction of magnetization for the group is represented by a cross centring the dotted line circle of confidence, the radius of which was computed using Fisher's method.

The fact that the parameter $\hat{K}$ of the group is relatively high, coupled with the fact that the mean direction of magnetization is almost diametrically opposed to the direction of the present field of Earth at the collecting site, suggest strongly that the mean direction given in Fig. 1 is that of a stable component of magnetization in the rocks and that it reflects the attitude of the ambient magnetic field of Earth at the time the rocks cooled from magmatic temperatures.

In a previous study[3], I found that the mean directions of magnetization of the Monteregian Hills lie along an axis represented by two *X*'s in Fig. 2. The attitude of this axis was computed from the mean directions of magnetization of two groups of rocks which were respectively polarized downward in the north-west quadrant and upward in the south-east quadrant. Although the magnetization direction of the Mount Megantic rocks is almost parallel to this axis, it is more accurate, for the sake of geological correlation, to compare the pole positions, which may be inferred from the Mount Megantic and the Monteregian Hills palæomagnetic directions respectively. The reason for this is the remoteness of the two groups of collecting sites. These pole positions are represented stereographically in Fig. 3, and they are labelled '*m*' and '*M*' respectively. Their proximity and the overlapping of their respective ellipse of confidence strongly suggest that the Mount Megantic

Potassium/argon age determinations by Geological Survey of Canada (G S C) and the Massachusetts Institute of Technology (M I T)

basic rocks and the Monteregian Hills were intruded at the same time

Pole positions derived from other North American rocks of known ages[4] are also plotted in Fig 3 It appears from these data that a marked shift of the pole occurred between Cretaceous and Triassic times It would seem, therefore, that pre- and post-Triassic rocks could be distinguished on the basis of their palæomagnetic directions If this line of reasoning were legitimate, the '*M*' and '*m*' poles belong to the post-Triassic group and their proximity to the Cretaceous pole would suggest further a Cretaceous age for both the Mount Megantic and the Monteregian Hills rocks This conjecture was recently supported by potassium/argon age determination data (Table 3) released by two independent laboratories on samples collected from three of the Monteregian Hills and from Mount Megantic Thus, palæomagnetic and radiogenic data support independently the synchronous intrusions of these two rock units and place them in Cretaceous times

I thank the Director of the Geological Survey of Canada for permission to publish this work

DIFFERENTIAL SECONDARY MAGNETIZATION IN SOME BRITISH CAMBRIAN ROCKS

By D E T BIDGOOD
Department of Geology, University College, Cardiff

TWELVE orientated rock specimens were collected from three horizons in the Hartshill Quartzites and the Hyolithus Limestones from two localities near Nuneaton Geologically[1] the quartzites include true quartzites and ferruginous sandstones coloured red or pink, while the limestones consist of organic material in a fine-grained matrix of calcite, iron minerals and other material, the whole strongly red stained The rocks dip to the south-west at about 40 deg

Magnetic results were obtained for eleven rocks and are plotted on the equal area stereonet (Fig 1) in their field orientations, the twelfth was too weak to give significant results with the existing magnetometer Combining the vectors for the four specimens from the Hyolithus Limestones by taking the mean of the direction cosines and making a statistical estimate of the dispersion after Fisher[2] gives

$$D\ 017° \quad I\ 23° \quad \alpha\ 16° \quad \varkappa\ 33$$

The following abbreviations are used D, declination measured from true north, I, inclination to the horizontal, positive downwards, α, semi-angle of the cone of confidence drawn at the 95 per cent probability-level, $\varkappa$, estimate of precision In contrast, the mean direction obtained from the seven specimens from the quartzites is

$$D\ 132° \quad I\ 64° \quad \alpha\ 25° \quad \varkappa\ 6$$

Correcting for the dip of the rocks moves both the mean directions towards the south-west by about 20 deg , so that when these directions are compared with those found in Cambrian rocks from Wales[3] the quartzites give a similar direction, but the mean vector for the limestones is about 90 deg removed

All the rocks were demagnetized in a c fields of up to 100 œrsteds using apparatus similar to that described by Creer[4] The new vectors obtained on re-

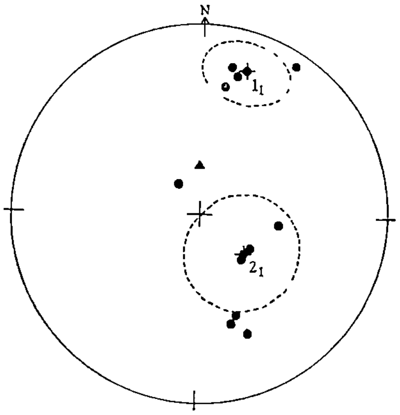

Fig 1 Equal area stereonet showing the positions of the magnetic vectors for eleven rocks from the British Cambrian together with the group mean vectors All vectors are in field orientation ●, Vector plotting in lower hemisphere, 1_1, mean vector for limestones, 1_2, mean vector for limestones after a c washing, 2_1, mean vector for quartzites, 2_2, mean vector for quartzites after a c washing, 2_3, mean vector for quartzites after a c washing and correction for dip, •, vector for Trias rocks, ■, vector for Cambrian rocks, ▲, direction of present dipole field The broken lines show the circles of confidence drawn at the 95 per cent level

measuring (Fig. 2) give mean directions for the quartzites

$$D\ 161° \quad I\ 55° \quad \alpha\ 15° \quad \kappa\ 14$$

and for the limestones.

$$D\ 015° \quad I\ 44° \quad \alpha\ 9° \quad \kappa\ 115$$

where the rocks are in their field orientations Both groups show a reduction in the amount of scatter and both show a displacement of the direction of the mean towards the south-west which cannot be attributed to the removal of a component of secondary magnetization parallel with the present geomagnetic field

The displacement of both mean vectors in a similar direction would also rule out the possibility that the limestones were originally magnetized in a reverse direction to the quartzites and have both taken on a component of secondary magnetization to give their present positions The presence of a reversal is also unlikely since the limestones occur stratigraphically within the quartzite series, samples from above and below the limestone horizon give similar directions of magnetization and there is no evidence of any marked break in deposition

Comparing the change in the intensities of magnetization produced by the a c washing there is a marked difference between the limestones, which lose about 85 per cent, and the quartzites, which show little change in intensity This suggests that the two rock types have taken on very different components of secondary magnetization

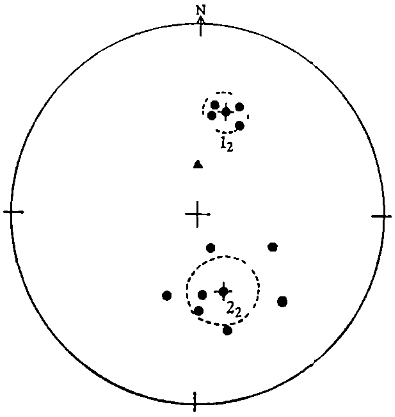

Fig 2 Equal area stereonet showing the positions of the magnetic vectors after a c washing, together with the group mean vectors All vectors in field orientation Symbols as in Fig 1

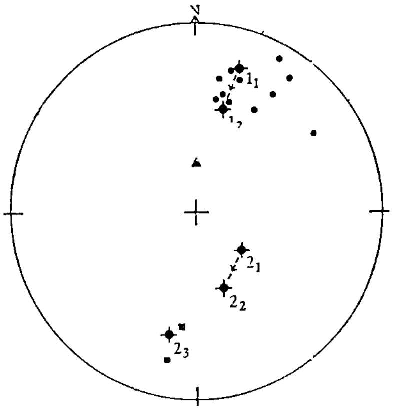

Fig 3 Equal area stereonet showing the relation of the mean positions for these Cambrian rocks to directions determined by other workers from Trias and Cambrian rocks Symbols as in Fig 1

The mean vectors for the two groups in field orientation are given in Fig 3 both before and after a c washing together with mean vectors for rocks of Trias age from Europe[5,6] and for the Caerbwdy Sandstones of Cambrian age from Wales[3] The mean direction for the Hyolithus Limestones before washing lies within the group of Trias results and accords well with those from rocks of Bunter age, the effect of the washing is to shift the mean direction towards the Cambrian direction For the Hartshill Quartzites the mean before washing lies close to the Cambrian direction, and the washing moves the vector still closer so that if this mean direction is corrected for the observed dip of the rocks the resultant vector

$$D\ 193° \quad I\ 34° \quad \alpha\ 16° \quad \kappa\ 12$$

is in good accord with the Cambrian direction

Combining the magnetic and geological evidence these observations may be explained as follows The Hartshill Quartzites and the Hyolithus Limestones were weakly magnetized parallel to the geomagnetic field in Cambrian times Uplift and erosion having removed any overlying rocks, these Cambrian rocks lay at or near the surface in the Trias During the deposition of the thick series of red beds of Trias age which are now exposed to the north-west of the Cambrian rocks, these were penetrated by iron-bearing ground waters which, in depositing new iron minerals and oxidizing existing minerals to new forms, imposed a chemical remanent magnetization[7,8] The degree to which the Cambrian rocks were affected by this process depended on their permeability, this was slight in the quartzites, but greater in the more permeable limestones That this new magnetization of the limestones could not be removed completely by washing in a c fields up to 100 œrsteds is in agreement with Creer's work[4] on unstable Keuper Marls which in some cases still retained components of secondary magnetization after washing in fields of up to 850 œrsteds

If it is correct to assume that the quartzites after a c washing give a true record of the direction of the Cambrian geomagnetic field the position of the magnetic pole at that time can be calculated as

$$\text{Lat } 18°\text{ N} \quad \text{Long. } 165°\text{ E} \quad d\psi\ 10° \quad d\chi\ 18°$$

where $d\psi$ and $d\chi$ are the lengths of the semi-axes of the elipses of confidence drawn at the 95 per cent probability-level This pole position is in good agreement with those determined from the British Cambrian and from rocks of similar age from Norway[9]

This work was carried out while I was a student at the Sedgwick Museum, Cambridge, and I take this opportunity to thank W B Harland and Dr R Hey of that department for their help and encouragement

AUTO-IMMUNIZATION AND LIVER CIRRHOSIS

By Dr. W. MORI*
Department of Pathology
AND
Dr T. SUZUTA
Department of Serology, University of Tokyo, Faculty of Medicine

RECENT progress of work on auto-immunization is remarkable, and the occurrence of this unusual condition has been reported or suggested in various sorts of diseases, one of which is liver cirrhosis Gajdusek[1] applied the complement-fixation reaction widely and revealed the existence of auto-antibodies against the liver as well as several other tissue homogenates in cases of some chronic diseases, including liver cirrhosis Tsujino[2] succeeded in producing by means of an immunological method some experimental condition which he called cirrhosis-like liver Recently, King[3] reported a case of liver cirrhosis in which many *LE*-cells were revealed, and with a review of similar conditions reported, he concluded that some kinds of liver cirrhosis should be a manifestation of auto-immune reaction of the liver

In our recent work, we tried to reveal the presence of an auto-antibody in serum against liver tissue obtained from the same individual, which we thought to be the real auto-immunization As shown in Table 1, fifteen cases have been tested so far, most of which at autopsy revealed various kinds of liver alterations such as cirrhosis or fibrosis, liver cell necrosis, primary liver cell carcinoma, etc Age of the patients varied between 8 and 74 yr , and all these were Japanese males The time of autopsy after death varied from 2 25–15 hr , most of them were rather fresh and less than 4 hr , during which period the bodies were not kept under refrigeration In one case of primary liver cell carcinoma, both the tumorous and non-tumorous parts of the liver were examined As for the cases with metastatic tumours in the liver, special care was taken to avoid contamination of the liver specimen with the tumour tissue

A small piece (20–30 gm) of the liver tissue and a cup of blood were collected from each case of autopsy Within 24 hr , the blood was centrifuged, and the separated serum was incubated in a water bath kept at 56° C , for 30 min Sodium azide was added in 0 1 per cent as a preservative On the other hand, the tissue specimen was weighed and cut with a razor blade into small pieces , four times by weight of saline solution was added This crude suspension was homogenized thoroughly, first with a Waring blender, and next with tissue grinder. After sodium azide (0 1 per cent) was added the tissue homogenate was centrifuged (5,000 r p m , 20 min) and the supernatant was preserved for the serological test A small segment of tissue was put into formalin solution for histological study

To reveal auto-antibodies, Ouchterlony's agar reaction method[4], modified by Wilson and Pringle[5], was used Interactions between matched serum and liver tissue were chiefly observed

Among fifteen cases examined, two showed a positive reaction, as shown in Table 1 Incubation for 4 days at 38° C was necessary to develop a definite line on the agar plate in one case (No 2), and it took 10 days in the other (No 14) Table 1 also shows the histological feature and weight of the liver of each case None of the five cases, including one each of hæmolytic anæmia and chronic nephritis,

* Present address Department of Pathology, Tokyo Medical and Dental College, Ushima, Bunkyo-ku, Tokyo

which showed no remarkable primary liver change at autopsy, gave positive results in the serological test. Actually, there were ten cases with more or less altered liver tested in our work, among which none of the cases of acute liver necrosis, primary liver cell carcinoma, and liver fibrosis showed the development of auto-immunization. A total of six cases of cirrhosis of the liver were tested, and both the cases which showed serologically positive results were in this last group.

Grossly, no atrophy was noticed in either of those two cirrhotic livers which showed positive serological reaction, one weighed 1,540 gm. and the other 1,500 gm. Three metastatic tumour nodes were found in the liver of case No. 2, but they were too small to influence the weight of the liver.

Microscopical investigation of those cases revealed an interesting fact that the two were quite similar also in histological character. Sections of the liver in those two cases showed rather small, uniform pseudolobules surrounded with thin trabeculæ of fibrous tissue, without any marked scar formation. Lymphocytic infiltration and bile-duct proliferation in portal areas were seen, but quite slight. Neither nodular hyperplasia nor adenomatous growth of liver cells was noticed. Elastosis was not marked. Fatty metamorphosis of the liver cells was especially marked in case No. 14. As shown in Table 1, the cirrhotic or fibrotic livers tested in this work showed various histological features, and the only two cases of those which had quite the same gross and histological characters gave a positive auto-immune reaction. This fact was considered to be too serious to be neglected as a matter of accidental coincidence. Moreover, those two cases had one common feature in regard to previous histories, namely, alcoholism. The liver of those two cases showed the feature of mild, slowly-progressing cirrhosis of a rather portal type which could be classified as nutritional when both clinical and pathological results were considered.

The definite serological interactions were found only in cases of liver cirrhosis so far as examined, and they could be exclusive for certain types of this disease. Even so, the reason why the auto-antibodies against the liver tissues were found only in cases of a so-called nutritional type of cirrhosis are still unknown. However, the fact that numerous fat droplets were revealed histologically in the lung capillaries of those cases apparently suggests the possibility of an outflow of the fat extracts of the liver cell components into the blood stream in the case of severe fatty metamorphosis of the liver, which might cause developing auto-immunization.

COUNTERACTION BY CYSTEINE OF GLYCOGENOLYSIS AND INHIBITION OF MICROSOMAL PROTEIN SYNTHESIS PRODUCED BY DIMETHYLNITROSAMINE

By Dr. P. EMMELOT and I. J. MIZRAHI

Department of Biochemistry, Antoni Van Leeuwenhoek-Huis, The Netherlands Cancer Institute, Amsterdam

WITHIN a few hours of administration of dimethylnitrosamine (DMNA) and before any other lesion can be observed, there is found a severe inhibition of amino-acid incorporation into the proteins of the isolated microsomal-soluble fraction of rat liver[1,2]. Indirect evidence has been presented[1] that DMNA is not inhibitory in itself, but that the compound is first converted by an oxygen- and reduced triphosphopyridine nucleotide-dependent *N*-demethylase, located in the microsomal membranes, to the *N*-hydroxymethyl (methylol) derivative. The latter is very reactive and unstable so that either this derivative, or the formaldehyde released therefrom, may act as the toxic agent *in situ*. Moreover, the monomethylol derivative might also give rise to diazomethane[2]. Any one of these derivatives may react with susceptible groups of the enzymes, cofactors or ribonucleic acid (RNA) templates of the protein synthetic process[1]. Although it is not known which of the possible derivatives, $O=N-N=(CH_2OH)_2$, H_2CO or CH_2N_2, is in fact responsible for the toxic action of DMNA, all three may react with sulphydryl groups which have been recognized[3] as cofactors of protein synthesis at the microsomal level. It is of interest that the lesion, in incorporation of amino-acid produced by DMNA, is located in the microsomes[1,2] and not in the soluble (*s*) fraction which catalyses amino-acid activation and the transfer of the latter to *s*-RNA. Next to its effect on protein synthesis, DMNA has also been found to cause the disappearance of glycogen from rat liver[4]. Three hours after the administration of DMNA (50 mgm./kgm. body-weight), when changes in the endoplasmic reticulum[4] and an inhibition of microsomal protein synthesis were observed, the glycogen content appeared, both by electron microscopy and chemical analysis, to be normal, whereas 17 hr. later almost all the glycogen had disappeared. Three hours after a two-fold greater dose of DMNA, 20 per cent (average) of the glycogen had disappeared, the bulk of the latter being lost in the period 3–10 hr. after DMNA injection.

In the present experiments we have been able to show that administration of cysteine to rats markedly counteracts both the percentage inhibition of microsomal protein synthesis and the glycogenolysis which result from the injection of DMNA. Cysteine administration according to the régime listed in the legend of Table 1 (or slightly varied) caused a marked increase in the *in vitro* protein labelling of the later isolated microsomal-soluble fraction of liver by leucine-1-^{14}C (50–150 per cent increase in 8 experiments). A relatively greater effect (150–350 per cent increase) of cysteine administration was always

Table 1 *In vitro* INCORPORATION OF LEUCINE-1-^{14}C INTO THE PROTEINS OF THE MICROSOMAL-SOLUBLE FRACTION AND THE GLYCOGEN CONTENT OF LIVERS FROM NORMAL AND DMNA-TREATED RATS AS AFFECTED BY CYSTEINE ADMINISTRATION

DMNA	Cysteine	Protein radioactivity of microsomal-soluble fraction			Glycogen content of liver slices
		(counts/min at 'infinite' thickness)	(per cent change)		(per cent of wet weight of liver)
—	—	685			8 1
—	+	1409	+106		6 1
+	—	201		—71	2 2
+	+	832	+314	—41	5 5

150 mgm DL-cysteine was administered subcutaneously twice daily for 2 days to 300 gm rats of the inbred strain *U* Early next morning the rats received saline (0 1 ml) or DMNA (100 mgm /kgm body-wt) dissolved in saline intravenously and another 150 mgm of cysteine subcutaneously These, and similarly treated rats which had not received the cysteine, were killed 5 hr later The incorporation of leucine-1-^{14}C into the proteins of the isolated microsomal-soluble fractions (10,000*g* supernatant) was studied as described in ref 1 Glycogen was measured in slices prepared from the same livers by the anthrone method

observed on the decreased incorporation of amino-acid of the corresponding fractions prepared from the livers of rats 3–10 hr after injection of DMNA The experimental results in Table 1 illustrate a case in which the rats had been subjected to the toxic effect of DMNA for 5 hr Experiments of this kind can only be interpreted in terms of an increase in amino-acid incorporation, or of a counteraction by cysteine of the DMNA-inhibited amino-acid incorporation, if the radioactivity of the immediate precursor is known If cysteine in some way or another had produced a decrease in the concentration of the endogenous leucine of the soluble fraction, a smaller dilution of the added ^{14}C-leucine and an increase in labelling of protein would have resulted The following results, however, make it likely that this was not the case

Experiments on the incorporation of amino-acid into the proteins of liver slices of the various rats, treated according to Table 1, gave results identical to those of Table 1 Since the increase in the incorporation of amino-acid into the proteins of the liver slices of rats which had received cysteine (controls 40 and 66 per cent, DMNA-treated 62 and 112 per cent increase in two experiments) was not accompanied by an increase in carbon-14 content of the respiratory carbon dioxide derived from leucine-1-^{14}C, as compared with the corresponding data obtained with rats which had not received cysteine, it followed that the increase in protein labelling was not due to a decrease in the amount of endogenous leucine The results of four experiments in which the 105,000*g* supernatants of the livers from four rats, treated according to Table 1, were incubated with leucine-1-^{14}C and adenosine triphosphate, followed by isolation (phenol method) and purification (through 'Sephadex') of the ^{14}C-leucyl-*s*–RNA formed, supported the latter conclusion The radioactivity of the control- and DMNA-treated preparations (± cysteine) was identical This suggests that both the stimulatory effect of cysteine on the incorporation of amino-acid system of the normal rats and the counteraction by cysteine of the percentage inhibition by DMNA is exerted at the microsomal level

It is shown in Table 1 that cysteine administration also counteracted the glycogenolysis produced by DMNA, some measure of variation in this and the above effect of cysteine being noted with individual rats Cysteine administration (150 mgm twice daily for 2 days) also resulted in, or markedly prolonged, the survival of rats which had received a lethal dose of DMNA (22 5 mgm /300 gm rat, given immediately after the fourth cysteine administration , all controls dying within 40 hr)

It may thus appear that cysteine, although not being tolerated too well by some of the rats (especially the younger ones), and apart from its more specific effect on microsomal protein synthesis (compare the controls), prevents or counteracts DMNA toxicity in general It is of interest that cysteine and cysteamine (cysteamine *per se* shows also some measure of toxicity) also protect against a lethal dose of nitrogen mustard[5] Although not permitting a definite choice, the correspondence in protective effect of cysteine against DMNA and the alkylating agent nitrogen mustard, might indicate that the methylating agent diazomethane is the actual toxic derivative of DMNA The protective effect of cysteine against DMNA toxicity may be due to a direct interaction of the sulphydryl groups of the former with the highly reactive and toxic DMNA derivative, or to a transitory blockage of tissue SH-groups which are thus unable to react with the DMNA derivative

DETECTION OF A POSSIBLE INTERMEDIATE IN OXIDATIVE PHOSPHORYLATION

By DR C H SUELTER, M DELUCA, DR J B. PETER and PROF P. D BOYER

Department of Physiological Chemistry, University of Minnesota, Minneapolis

A STRIKING feature of oxidative phosphorylation is that although occurrence of the process has been recognized for some twenty years, no phosphorylated intermediates have been demonstrated The formation of three or more molecules of adenosine triphosphate (ATP) for each reduced nicotinamide or flavin-containing co-enzyme oxidized by oxygen suggests participation of one or more intermediates Several investigations[1–3] have indicated that mitochondria, in the absence of an added phosphoryl acceptor, may accumulate material capable of allowing rapid formation of ATP Whether the observations reflect the presence of a phosphorylated intermediate or some other form of energy storage is uncertain Data on ADP ⇌ ATP exchange have been interpreted as indicating a phospho-enzyme intermediate[4] Various findings, in particular the demonstration that oxygen between the β- and γ-phosphorus atoms of ATP is furnished by ADP[5], strongly infer that any phosphorylated intermediates formed are derived from orthophosphate (P_i), followed by reaction with ADP to give ATP Present information does not exclude, however, the possibility that the first covalent compound formed from both P_i and ADP in one or more steps of oxidative phosphorylation is ATP itself

The importance of detection and isolation of any intermediates in oxidative phosphorylation to the understanding of the reaction mechanism served as the motivation for our work As reported in preliminary communications[6], these investigations have led to the demonstration of the rapid uptake of $^{32}P_i$ into a protein-bound form Conditions affecting the labelling of this unidentified phosphate suggest its participation in oxidative phosphorylation, and presentation of some details in this regard, together with some properties of the substance is the principal purpose of this article

Rapid Formation of an Unidentified Phosphate

Conditions which might be expected to favour accumulation of an intermediate of oxidative phosphorylation in mitochondria are incubation in the presence of excess substrate, oxygen and P_i, but without added ADP In our experiments, mitochondria have been incubated under such conditions but in the absence of added P_i, then exposed for short periods to a trace of high specific activity $^{32}P_i$ The trace of added $^{32}P_i$ to the medium was avoided because such addition would reduce the possibility of detecting a small fraction of the total added phosphorus-32 that might be present in any intermediate Stopping of the reactions and nearly complete removal of $^{32}P_i$ and AT^{32}P from the protein-bound phosphorus-32 was achieved by adding a concentrated urea solution containing a non-ionic detergent to give apparent solubilization of the mitochondria[7], followed by passage through a column of anion exchange resin. After incubation for a few sec or more with $^{32}P_i$ presence of ^{32}P in this unidentified material and in AT^{32}P are shown in Fig 1 In this and other comparable experiments, the average amount of ^{32}P in the unidentified fraction has been slightly greater at 10 sec than at 1 min. The tendency for the decrease in 1 min sometimes noted might reflect decrease in specific activity of $^{32}P_i$ resulting from interchange with P_i and ATP pools of mitochondria Evidence exists for the presence of intramitochondrial P_i which does not readily mix with medium P_i (refs 10, 5)

The rate of labelling of the unidentified phosphate is much more rapid than that of phospho-proteins or phospho-lipids, as reported by Conover *et al* [11] and by Burnett and Kennedy[12], and thus does not appear to represent the initial uptake into a large pool of phosphorylated compounds A time-course as given in Fig 1 is in harmony with participation of the unidentified phosphate as an intermediate A rate of labelling comparable with or slower than that of ATP would not, however, preclude participation of a compound as an intermediate in view of possible effects of relative reaction-rates as well as compartmentation in mitochondria An effect of relative reaction-rates arises from the demonstrated dynamic reversal of ATP formation accompanying oxidative phosphorylation[13,14] The pathway of phosphorus-32 may be simply represented as follows

$$P_i \rightleftharpoons \text{phosphorylated intermediate} \rightleftharpoons \text{ATP}$$

After addition of $^{32}P_i$, the specific activity of the intermediate would be expected to be similar to that of the P_i if the interchange in the first step were rapid compared with that in the second step Conversely, the specific activity of the intermediate would approximate that of the ATP if the interchange in the second step were more rapid Indeed, in some of our experiments with small variations in conditions, the rate of appearance of ^{32}P in ATP and in the unidentified phosphate has been similar.

The absolute amount of phosphorus-32 appearing in the unidentified fraction is only about 0 2–0 3 per cent of the added $^{32}P_i$ It became important, therefore, to assess the possibility that the small activity found might arise from experimental artefact and not represent a metabolically derived phosphate compound Controls in which $^{32}P_i$ or AT^{32}P was added with or after the concentrated urea demonstrated that appearance of the product depends on incubation for the short periods with mitochondria That the product very likely is a derivative of P_i is shown by the liberation on short heat treatment at neutral *p*H of the radioactivity in a form extractable with added P_i by isobutanol-benzene from acid molybdate[8] and precipitable with P_i as magnesium ammonium phosphate In addition, the product had a radioactivity with penetration characteristics and half-life similar to ^{32}P

The experiments have been hampered considerably by the presence of varying amounts of impurities in $^{32}P_i$ as received which appear in the column eluates of controls Of various purification techniques, that used at present, and which is successful with most samples, is as follows The sample is made alkaline with ammonia, adsorbed on to a small column of 'Dow-1-bicarbonate' anion exchange resin, and the

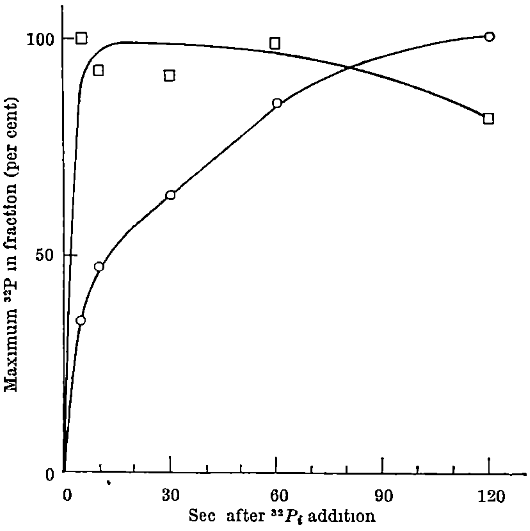

Fig 1 Time-course of appearance of $^{32}P_i$ in ATP and in the unidentified phosphate A mixture containing 11 m*M* sodium glutamate, 6 m*M* KCl, 240 m*M* sucrose, 1 m*M* ethylenediamine tetra-acetate (EDTA) and mitochondria from roughly one-fourth of a rat liver in a total volume of 2 ml was incubated with rapid stirring under oxygen at *p*H near 7 and 15° C for 1 min A drop of high specific activity $^{32}P_i$ was then added, and the reaction stopped at the desired time by additions of 6 vol of cold 6 *M* urea and 4 per cent detergent ('Triton X-100') The sample was passed through a column (about 0 8 × 8 cm) of 'Dow-1-Cl' and ^{32}P in the eluate measured The incorporation of $^{32}P_i$ into ATP was estimated as the ^{32}P not extracted by isobutanolbenzene in the Berenblum and Chain assay (ref 8), performed on the supernatant solution after precipitation of protein by cold 0 3 *M* perchloric acid The urea–'Triton' and the sucrose solutions were purified by passage through a mixed ion-exchange resin The mitochondria were prepared essentially as described by Schneider and Hogeboom (ref 9) with 1 m*M* EDTA, *p*H 7 4, added to the 0 25 *M* sucrose

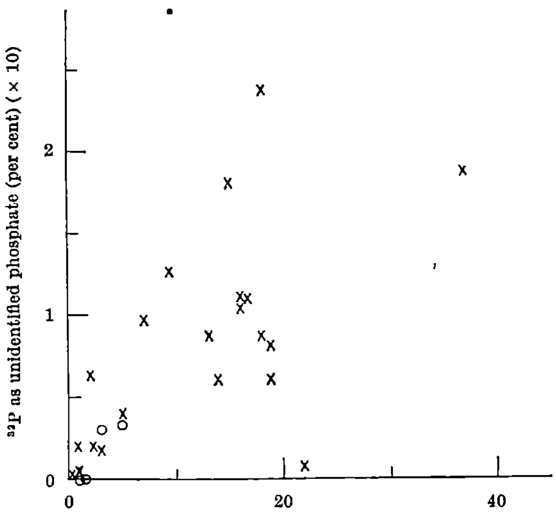

Fig 2 Comparison of the percentage of the total $^{32}P_i$ incorporated into the unidentified phosphate and ATP Experimental conditions were as given in Fig 1, with incubation for 30 sec after $^{32}P_i$ addition, for results designated by crosses For results designated by circles, 10^{-3} M 2,4-dinitrophenol was present

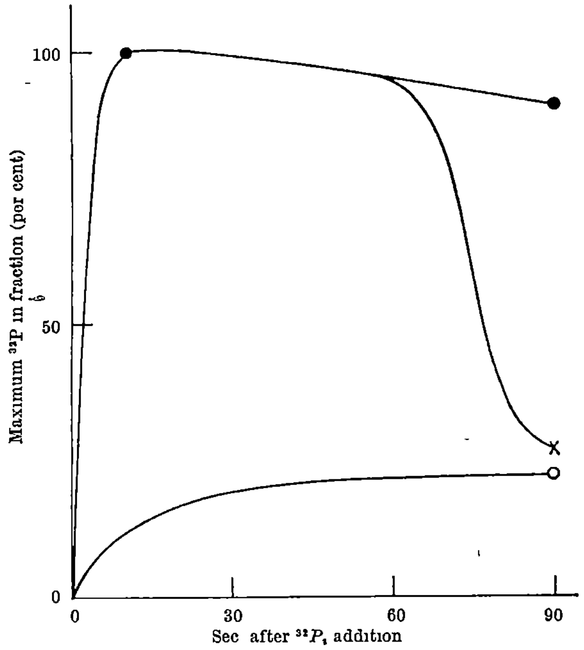

Fig 3 Effect of added P_i and ATP on the percentage of $^{32}P_i$ appearing in the unidentified phosphate Experimental conditions were as given in Fig 1, with addition of P_i and ATP to give final concentrations of 1 mM each at the times indicated ●, No added P_i and ATP, ×, P_i and ATP added at 60 sec, ○, P_i and ATP added before $^{32}P_i$

$^{32}P_i$ eluted with 0 15 M ammonium bicarbonate–0 013 M ammonia Mixing of the column eluate with 'Dow-50(H$^+$)' removes ammonia and liberates carbon dioxide to give a $^{32}P_i$ solution low in total salt concentration This procedure has given $^{32}P_i$ in which controls showed less than 1 per cent as much phosphorus-32 in column eluates as did incubated samples

The amount of the unidentified phosphate detected, although representing only a small fraction of the $^{32}P_i$ added, is about comparable on a molar basis with the level of cytochromes present, as estimated from the data of Chance and Williams[1] If one assumes that the specific activity of the unidentified phosphate is equal to that of the P_i of mitochondria, the maximum amount detected is roughly 0 05 µmole per gm of rat liver mitochondrial protein. The possibility exists that this amount represents only partial phosphorylation of the precursor of the unidentified phosphate.

Production of material from a given preparation of mitochondria is fairly reproducible, but different preparations show considerable variation in their ability to incorporate $^{32}P_i$ into both the unidentified phosphate and ATP A summary of results collected over a period of several months with liver mitochondria is given in Fig 2 These show that mitochondrial preparations with ability to accumulate a higher per cent of the added trace amount of $^{32}P_i$ as ATP show a tendency for formation of more of the unidentified substance On storage for a few hours at 0°, ability to form both intramitochondrial AT^{32}P and the unidentified substance declines

A similar labelling of the unidentified phosphate is obtained with glutamate, α-ketoglutarate, β-hydroxybutyrate or succinate as substrates or without added substrate The material has also been detected in mitochondria from rat liver and heart, as well as ox liver and heart and rabbit heart

Effect of Added P_i and ATP and of Inhibitors on the Unidentified Phosphate

Any substance which was an intermediate in the formation of ATP from P_i would be expected to undergo rapid interchange with added P_i or ATP or both The results given in Fig 3 show that addition of unlabelled P_i and ATP after incorporation of ^{32}P into the unidentified phosphate readily results in loss of ^{32}P from the fraction Clearly, a dynamic interchange between the fraction and P_i–ATP exists. Further, addition of unlabelled P_i and ATP before

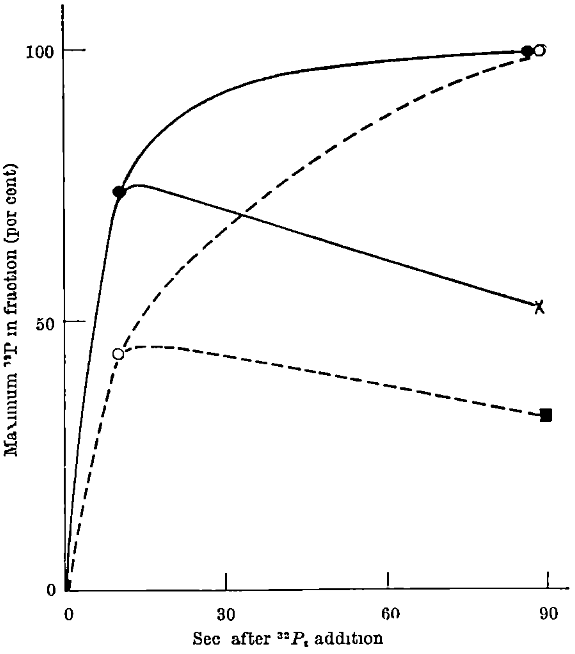

Fig 4 Effect of addition of 2,4-dinitrophenol on the labelling of the unidentified phosphate and ATP Experimental conditions were as noted with Fig 1, except that the added urea was at pH about 9 5 and no detergent was present 2,4-Dinitrophenol additions were made as noted The solid lines indicate the ^{32}P in the unidentified phosphate and the dashed lines the ^{32}P in the ATP ●, ○, No DNP, ■, ×, 10^{-3} M DNP at 10 sec

Table 1 REPRESENTATIVE EFFECTS OF INHIBITORS ON LABELLING OF UNIDENTIFIED PHOSPHATE AND ATP

Exp	Inhibitor	Sec after $^{32}P_i$ addn	Percentage added as $^{32}P_i$ as Unidentified phosphate	ATP
1	None	10	0 07	9

	p-Mercuribenzoate, 10^{-3} *M*	30	0 00	0

Conditions were essentially as given with Fig 1 with rat liver mitochondria unless otherwise specified In some experiments, urea solutions made alkaline with NH_3 were used instead of urea-detergent solutions 2,4-Dinitrophenol was added 1 min before $^{32}P_i$ Cd^{++} were added 5 min before $^{32}P_i$ Oligomycin, KCN, amytal and *p*-mercuribenzoate were present during 5–10 min at 0° and 1 min at 15° before $^{32}P_i$ addition In experiment 6, ox liver mitochondria were used Mitochondria from about 1 gm of liver were used in experiments 1, 3, 4 and 6, and from about 0 2 gm of liver in experiments 2 and 5

the trace of $^{32}P_i$ nearly prevents incorporation of phosphorus-32 into the unidentified phosphate This is the expected result from marked diminution of the specific activity of $^{32}P_i$

The effect of various inhibitors of oxidative phosphorylation establishes a close relationship between the labelling of the unidentified phosphate and oxidative phosphorylation Presence of 2,4-dinitrophenol, a well-recognized 'uncoupler' of oxidative phosphorylation, both reduced the formation and accelerated the disappearance of the fraction, as shown by the results in Fig 4 and Table 1 The effectiveness of a given concentration of 2,4-dinitrophenol was not as great as might at first be anticipated from its known action on net oxidative phosphorylation and on the P_i–ATP exchange reaction, 10^{-4} *M* 2,4-dinitrophenol nearly completely abolishes these processes[13,15] As noted from Table 1, considerable phosphorus-32 was incorporated into the unidentified phosphate even in the initial presence of 10^{-3} *M* dinitrophenol Two factors may be responsible for this First, with decrease in the concentration of mitochondria, lower concentrations of 2,4-dinitrophenol are more effective, and secondly, the inability of 2,4-dinitrophenol, when initially present, sharply to reduce the labelling of the unidentified phosphate was paralleled by continued ability to label intra-mitochondrial ATP This could reflect a resistance of intra-mitochondrial ATP to breakdown in presence of 2,4-dinitrophenol as noted by Azzone and Ernster[16]

Effects of other inhibitors are also summarized in Table 1 Of particular interest are the effects of oligomycin This antibiotic has been shown by Lardy, Johnson and McMurray[17] to prevent ATP formation without an 'uncoupling' action Uptake of $^{32}P_i$ into the unidentified phosphate fraction is not affected or actually slightly increased when mitochondria are exposed to oligomycin Under these conditions, formation of $AT^{32}P$ is markedly decreased This gives strong evidence that the unidentified phosphate ^{32}P arises from $^{32}P_i$ and not from $AT^{32}P$ Further, as shown in Table 1, presence of 2,4-dinitrophenol decreases formation of the unidentified phosphate in presence of oligomycin

Cadmium ions, which Jacobs and Jacobs have shown to be potent inhibitors of oxidative phosphorylation[18], also prevent formation of the unidentified phosphate Azide, which has effects like both 2,4-dinitrophenol and oligomycin[19], as well as an inhibitory action on electron transport, also is effective in reducing formation of the unidentified phosphate Cyanide and presence of a nitrogen atmosphere cause some, but not marked, decreases in incorporation of $^{32}P_i$ into the unidentified phosphate These effects of inhibitors on formation of the unidentified phosphate are similar to the effects noted on the $^{32}P_i$–ATP exchange reaction[13,16]

Properties and Fractionation of the Unidentified Phosphate

The unidentified phosphate as present in column eluates is non-dialysable, retained on charcoal, and is separable from P_i by passage through 'Sephadex *G*-50' It is partly cleaved to P_i but mostly precipitated by brief exposure to dialysed eluates to cold 0 3 *M* trichloracetic acid, and is precipitated by acidic or neutral ammonium sulphate, ammonium sulphate plus dodecyl sulphate or ethanol It is not extracted from lyophilized fractions by ethanol, 3 to 1 ethanol diethyl ether, or acetone Treatment of the unidentified material with a bacterial proteinase has yielded a radioactive product which is dialysable and not precipitated as magnesium ammonium phosphate Dialysis of column eluates in presence of crude alkaline phosphatase markedly accelerates the appearance of $^{32}P_i$ in the dialysing medium These various findings suggest that the phosphoryl group of the unidentified phosphate is attached to a co-factor firmly bound to the protein or lipo-protein of mitochondria or to an amino-acid side-chain

After heating the dialysed eluates in a boiling water bath for 5 min at neutral *p*H, the phosphorus-32 readily passes through charcoal and is identifiable as P_i A *p*H-stability curve as based on the charcoal absorption test is shown in Fig 5 The half-life at *p*H 7 and 77° is 22 min First-order rate plots for the decomposition at *p*H 7 are essentially linear, giving strong indication that only one phosphorus-32 compound is present The rate of decomposition is not markedly modified by the presence of hydrogen

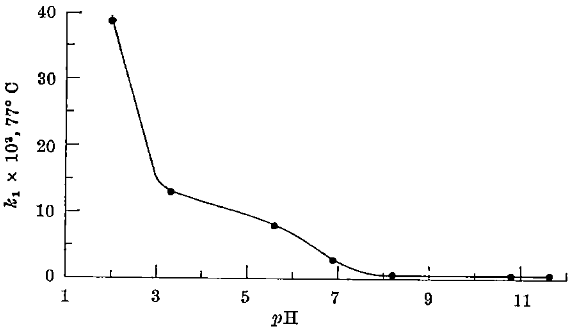

Fig 5 Effect of *p*H on the stability of bound $^{32}P_i$ The first-order rate constant, k_1, was determined as follows the eluates from columns after extensive dialysis against 0 02 *M* P_i, *p*H 6 8, were used directly in cleavage measurements The *p*H was varied by addition of HCl or NaOH, the sample heated at 77°, cooled, and the *p*H adjusted to near 7 The amount of bound fraction remaining was approximated by the amount retained on charcoal, $^{32}P_i$ appears in the eluate

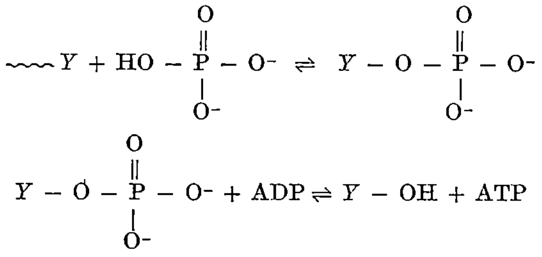
peroxide, hydrosulphite, molybdate, 2,4-dinitrophenol or *p*-mercuribenzoate, by ionic strength variation, or by replacement of air by nitrogen, but is about doubled in the presence of bromine The data are in agreement with attachment to a nitrogen, sulphur or oxygen atom in a structure not susceptible to hydroxyl ion attack but modifiable by bromine The stability work appears to eliminate the possibility of attachment of the phosphoryl residue to a seryl side-chain The unidentified phosphate is considerably more stable and shows a different dependence of stability on *p*H than 2,3-dimethyl-1,4-naphthaquinol 1-phosphate[20] Ubiquinone monophosphate is, however, more stable than the methyl substituted naphthaquinol phosphate[20]

Relation of the Unidentified Phosphate to Oxidative Phosphorylation

If the unidentified phosphate is an intermediate of oxidative phosphorylation, certain suggestions concerning the mechanism of formation can be offered Data from experiments with oligomycin, which is known to inhibit phosphate oxygen exchange associated with oxidative phosphorylation[21], indicates that the P_i molecule is incorporated intact into an intermediate The phosphoryl group is then transferred to ADP and the remaining oxygen exchanges with water oxygens as depicted in the following scheme



$$\sim\sim Y + \mathrm{HO} - \underset{\underset{\mathrm{O^-}}{|}}{\overset{\overset{\mathrm{O}}{\|}}{\mathrm{P}}} - \mathrm{O^-} \rightleftharpoons Y - \mathrm{O} - \underset{\underset{\mathrm{O^-}}{|}}{\overset{\overset{\mathrm{O}}{\|}}{\mathrm{P}}} - \mathrm{O^-}$$

$$Y - \mathrm{O} - \underset{\underset{\mathrm{O^-}}{|}}{\overset{\overset{\mathrm{O}}{\|}}{\mathrm{P}}} - \mathrm{O^-} + \mathrm{ADP} \rightleftharpoons Y - \mathrm{OH} + \mathrm{ATP}$$

followed by a rapid oxygen exchange,

$$Y - \mathrm{OH} + \mathrm{H^{18}OH} \rightleftharpoons Y - {}^{18}\mathrm{OH} + \mathrm{HOH}$$

Reversal of the above reactions would give rise to an exchange of P_i oxygens Such a possibility has been suggested by Boyer *et al* [6,13] and by Drysdale and Cohn[22] Furthermore, even though the search for possible phosphorylated intermediates is by no means complete, the finding at this time of only one apparent candidate for an intermediate together with other data suggests consideration of mechanisms by which the various oxidation steps are in some manner coupled to formation of a common phosphorylated precursor to ATP

In summary, the conditions governing the formation and disappearance of the unidentified phosphate fraction are consistent with, but by no means prove that, the substance is an intermediate in oxidative phosphorylation

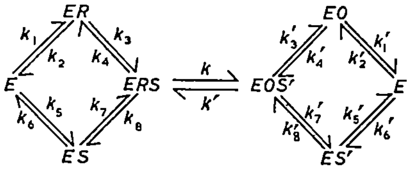
MECHANISM OF ACTION OF LIVER ALCOHOL DEHYDROGENASE

By Prof HUGO THEORELL, For.Mem.R.S., and Dr. J. S McKINLEY McKEE

Biochemistry Department, Medical Nobel Institute, Stockholm 60, Sweden

SEVERAL lines of inquiry have now shown that liver alcohol dehydrogenase (LADH) acts by forming binary and ternary complexes with coenzymes and substrates[1].



There are two reaction phases with interconversion between them (LADH and YADH represent liver and yeast alcohol dehydrogenase, respectively *E* represents 1/2 LADH, since each molecule has two independent binding sites *R* and *O* represent reduced (DPNH) and oxidized (DPN) diphosphopyridine nucleotide, respectively *S* and *S′* represent aldehyde and alcohol, respectively) It has also been confirmed that this complicated mechanism can, from a kinetic point of view, be described by the Theorell–Chance mechanism[2]

$$E + R \underset{k_2}{\overset{k_1}{\rightleftharpoons}} ER$$

$$ER + S \underset{k_3'}{\overset{k_3}{\rightleftharpoons}} EO + S'$$

$$EO \underset{k_1'}{\overset{k_2'}{\rightleftharpoons}} E + O$$

However, among previous attempts at experimental confirmation[3-5], there had been indications that at lower *p*H the ternary complexes affected the rate[4,5]

Kinetics without Inhibitors

For the general two-substrate equation:

$$e/v = \varphi_0 + \varphi_1/[S_1] + \varphi_2/[S_2] + \varphi_{12}/[S_1][S_2]$$

(primed symbols represent the reverse reaction), Dalziel[6] has derived the relations $\varphi_0 = \varphi_0'\varphi_2'/\varphi_{12}'$, $\varphi_0' = \varphi_1\varphi_2/\varphi_{12}$ and $\bar{K}_{eq}$ (0 9 × 10^{-11} *M*) (ref 7) = $\varphi_{12}/\varphi_{12}' = \varphi_0\varphi_1\varphi_2/\varphi_0'\varphi_1'\varphi_2'$, which distinguish the Theorell–Chance mechanism from other possible alternatives Consequently, Lineweaver–Burk plots were determined for various concentrations of each constant partner and the intercepts and slopes plotted against these concentrations to give the desired φ-values[6] Initial rates were measured on a sensitive fluorimeter with pen recorder[8], by following the DPNH fluorescence as DPN does not fluoresce Table 1 shows the experimental φ-values The relationship between them fulfils very well the sensitive requirements of the Theorell–Chance mechanism The rate constants calculated on the basis of that mechanism and the binary dissociation constants, $K_{E,\text{ald}}$, $K_{E,\text{alc}}$, $K_{E,R}$ and $K_{E,O}$, calculated from the rate constants are also given The agreement of the binary enzyme–coenzyme dissociation constants $K_{E,R}$ and $K_{E,O}$, with the values determined spectrophotofluorimetrically in equilibrium experiments in the absence of substrates (below), underlines further the operation of the Theorell–Chance mechanism There are several reasons for the simplifications in the overall mechanism which lead to Theorell–Chance kinetics

Table 1 0 1μ PHOSPHATE, 23 5° C, *p*H 7

(*a*) φ-Values and Theorell-Chance mechanism rate constants (1/φ)

φ_0 = 0 0135 sec
φ_1 = 0 090 sec μ*M*
φ_2 = 3 2 sec μ*M*
φ_{12} = 0 9 sec μ*M* (ref 2)
φ_0' = 0 32 sec
φ_1' = 1 9 sec μ*M*
φ_2' = 82 sec μ*M*
φ_{12}' = 10 500 sec μ*M* (ref 2)

k_2' = 74 sec^{-1}
k_1 = 11 1 sec^{-1} μM^{-1}
k_3 = 0 31 sec^{-1} μM^{-1}
k_2 = 3 12 sec^{-1}
k_1' = 0 525 sec^{-1} μM^{-1}
k_3' = 0 012 sec^{-1} μM^{-1}

(*b*) Calculated equilibrium constants for binary complexes

$K_{E,R}(k_2/k_1)$ = 0 28 μ*M*
$K_{E,\text{alc}}(k_2'/k_3')$ = 1060 μ*M*
$K_{E,O}(k_2'/k_1')$ = 141 μ*M*
$K_{E,\text{ald}}(k_2/k_3)$ = 10 0 μ*M*

(1) $k_1 \approx k_7$ and $k_1' \approx k_7'$ The rate constants for the binding of the coenzyme are nearly independent whether the enzyme is free or already combined with the substrate, (2) *k* and *k'* are both high, the ternary complexes being in rapid equilibrium, (3) $k_4 \gg k_8$ and $k_4' \gg k_8'$ The ternary complexes prefer to liberate the substrates first, these being less tightly bound than the coenzymes Thus, the dissociation velocity of the binary complexes in the last phase of the reaction becomes rate-limiting when both substrate and coenzyme are present in high concentration in the first phase and the maximum velocities are k_2 and k_2' rather than k_6 and k_6' k_1 and k_1' determined in the presence of high concentrations of aldehyde or alcohol really reflect the 'on' velocity constants k_7 and k'_7, which, since the equilibrium and kinetic values of $K_{E,R}$ and $K_{E,O}$ are practically the same, means that $k_1 \approx k_7$ and $k_1' \approx k_7'$

Spectrophotofluorimetric Dissociation Constant Determinations

Previously, fatty acids were found to form *EI* and *EOI*, but no *ERI* complexes, while the amides formed *EI* and *ERI*, but no *EOI* complexes[9] Many nitrogen compounds have now been found to form ternary complexes with both *R* and *O*, and imidazole has proved particularly interesting, as it forms complexes with zinc ions[10] and LADH contains zinc[3] like YADH[11], while the ternary imidazole complex *ERI* also had an even greater fluorescence than *R* and *ER* (Fig 1) This increased fluorescence may be due to interaction between the pyridine ring and zinc, although greater rigidity[12,13] and most probably energy transfer[14] have also been suggested The formation of the *ER* and *ERI* complexes is also shown by the different maximum wave-lengths of their emission spectra

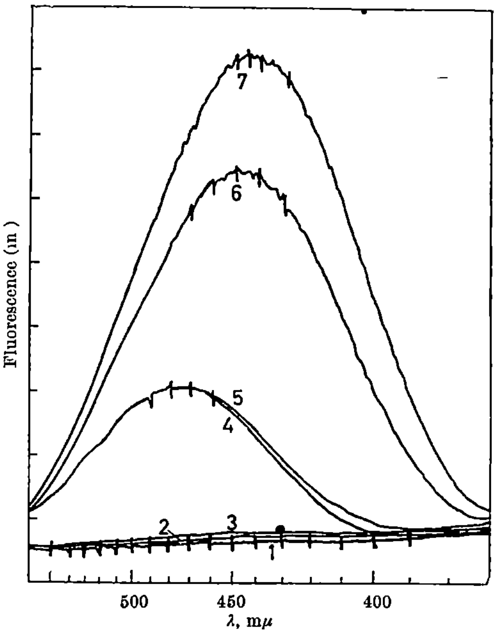


Fig 1 Fluorescence emission curves for LADH, DPNH and imidazole Excitation = 330 mμ
(1) Buffer (0 1μ phosphate, *p*H 7, 23 5° C), (2) buffer + 0 1 *M* imidazole, (3) buffer + 0 1 *M* imidazole + 2 2 μ*M* LADH, (4) buffer + 2 1 μ*M* DPNH, (5) buffer + 2 1 μ*M* DPNH + 0 1 *M* imidazole, (6) buffer + 2 1 μ*M* DPNH + 2 2 μ*M* LADH (*ER*), (7) buffer + 2 1 μ*M* DPNH + 2 2 μ*M* LADH + 0 1 *M* imidazole (*ERI*)

Table 2 summarizes the dissociation constants determined using the recording spectrophotofluorimeter (a Bausch and Lomb grating monochrometer to isolate the activating wave-lengths was coupled to a Beckman *DU* spectrophotometer with pen recorder to analyse the emitted fluorescence[5]) Except for $K_{E,O}$ and $K_{EO,I}$ the dissociation constants are essentially invariant with *p*H However, $K_{E,R}$ increases rapidly above *p*H 9 (ref 5), suggesting that SH-groups join the protein to the DPNH pyridine ring[15] The $K_{E,O}$ values were now higher than before, which resulted in the disappearance of previous disagreements between the equilibrium and kinetic values at lower *p*H (ref 5), the results now agreeing throughout with the Theorell–Chance mechanism They also show that with LADH–DPNH, the fluorescent and active sites are identical, which is apparently not the case with glutamic dehydrogenase[16] It is noticeable that at *p*H 6, *ER* is a thousand-fold more stable than *EO*, at *p*H 9 only twenty-fold, the change being caused largely by the increase in the stability of *EO* The variation of $K_{E,O}$ with *p*H was found to fit a monovalent dissociation curve which indicated the presence of a titratable group with a *pK* of 8 6

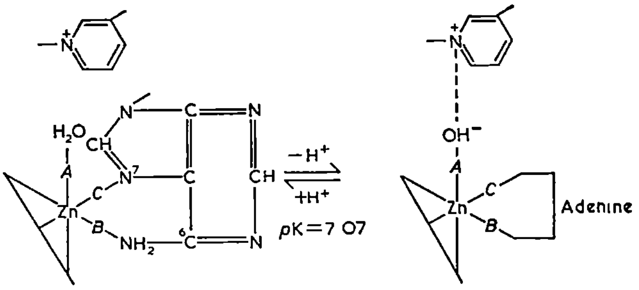
in the free enzyme, and of 7 1 in the binary *EO* (DPN–LADH) complex

Preliminary experiments with YADH indicated complex formation similar to that with LADH, while lactic dehydrogenase gave no such indication, which supports the hypothesis that imidazole and certain nitrogen compounds are joined to zinc and lactic-dehydrogenase does not contain zinc[17]

Kinetics with Imidazole and Inhibitors

Whereas with fatty acids and amides the ternary complexes were more stable than the binary[9], the opposite is the case with imidazole (Table 2) The influence on the kinetics of caprate, *iso*butyramide (IB) and imidazole was therefore studied For the general mechanism described here, $k_1 \approx k_7$ and $k_1' \approx k_7'$ This was found to be an example of a general rule that partners in a ternary complex do not seem to interfere appreciably with each other in regard to 'on' velocity constants, but mainly with the 'off' velocity constants, these increasing or decreasing to the same extent as there is mutual repulsion or stabilization in the complex While caprate and IB had only inhibitory actions, imidazole was interesting as at high concentrations of substrate and coenzyme it gave a stimulation of reaction velocity due to the formation of labile ternary complexes in the second phase of the reaction (Fig 2), but, when either concentration was low enough, inhibition occurred

Imidazole, which forms both the ternary complexes *ERI* and *EOI*, also competed with both aldehyde and alcohol This behaviour of imidazole, in view of its complexing properties with zinc, strongly suggests that zinc binds the substrates. That the binding of both coenzymes is weakened or disrupted by imidazole favours the idea that the adenine moiety which, unlike the pyridine ring, is the same in the coenzymes, forms a bidentate chelate to zinc[18] Inhibition experiments with the bidentate ligands orthophenanthroline and $\alpha\alpha'$-dipyridyl[19], and equilibrium experiments with glycine, all of which do not form ternary complexes and are strictly competitive with the coenzymes, as would be expected when only three bonds are free and the coenzyme–adenine forms a bidentate itself, support this They also indicate that the zinc bonds are octahedral[20], that zinc plays a central part in the binding of coenzymes and substrates[18,21], and that it is bound by three bonds to the protein In the natural β-isomer of DPNH the pyridine ring is so close to the adenine that energy transfer takes place between them[22], and, since adenine is presumably bound to zinc, the pyridine ring must also lie close to zinc In the free enzyme the free zinc bonds presumably hold water molecules, one of which at high pH (pH 8 6) loses a proton, the resulting attraction between ZnOH⁻ and the positively charged pyridinium ring of DPN accounting for the increase in the stability of the DPN–LADH complex with increasing pH



This does not operate with DPNH–LADH, where the pyridine ring carries no charge, while introduction of imidazole instead of OH⁻ eliminates the attraction effect, as is observed (Table 2)

Zinc is also implicated as the centre of the ternary complexes[18], one bond which, in *ER*, accommodates a water molecule and in *EO* is joined to the pyridine ring, now is occupied by the substrate. Caprate was found to compete with DPNH and alcohol, *iso*butyramide with aldehyde and DPN, and imidazole, with the exception of DPNH, with all four partners This suggests that alcohol and caprate have a different site of attachment from aldehyde and *iso*butyramide with imidazole able to go on either site Thus, while the *A*-bond of the DPN complex would be the bond at which alcohol is attached, it would not seem to be the bond for aldehyde However, two possibilities arise (*a*) *Two bonds* here a type of three-centre problem arises with one of the adenine bonds switching or flicking over Thus, alcohol would be on bond *A* and DPN across *B* and *C* During the rapid interconversion *EO*,alc. ⇌ *ER*,ald the adenine-N(7) would remain on bond *C* and the adenine-NH₂ would switch to the *A*-bond, DPNH thus being across *AC* and aldehyde on the *B*-bond (or the N(7) could flick to *A*, *C* becoming the aldehyde bond) Thus with DPN on two of the zinc bonds, *B* and *C*, the *A*-bond will only

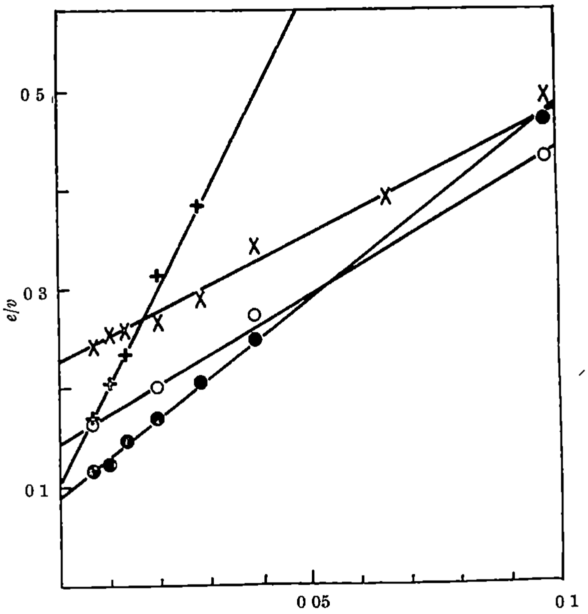


Fig 2 Stimulation and inhibition by imidazole (0 1μ phosphate, 23 5° C and pH 9) ×, No imidazole, ○, 2 mM, ●, 10 mM, +, 50 mM, [alc] = 6 1 mM

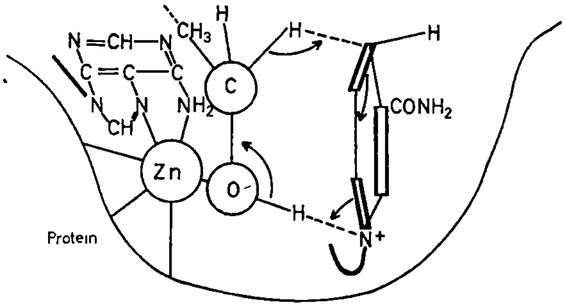

Fig 3 LADH ternary complexes (schematic)

accept alcohol, caprate or imidazole. DPN changing to DPNH implies a bond flick over, so that *B* (or *C*) becomes free, which only accepts aldehyde, *iso*butyramide or imidazole Consequently, as a result of a presumably small intermolecular rearrangement, the coenzyme determines which of two bonds is available, each bond determining what can become attached This concept gains some support from the different structures of the substrates *S* and *S'* and the stereospecific requirement that they change their position somewhat, relative to the enzyme surface[23] (*b*) *One bond* bond switching is unnecessary if the coenzymes stay on the same two bonds, but affect the third differently, so that it is a particular type of bond for each This is indeed the case with the binary complexes and presumably the positively charged pyridinium ring (DPN) allows or directs alcohol, caprate and imidazole on to the zinc bond, while the neutral pyridine ring (DPNH) only allows on aldehyde, *iso*butyramide and imidazole This mechanism, depending on the different charges of the pyridine (DPNH) or pyridinium (DPN) rings, with one bond and no molecular shifts, is of course attractive, but meets with some difficulties Perhaps the alcohol hydroxy group takes the place of the water molecule or OH^- involved in the Zn—OH-—N+ interaction (Fig 3) As has been remarked above, the bonds involved in the stability of the complexes are, apart from the zinc–protein bonds, weak to varying extents[24], but this seems necessary as strong bonds result in inhibition rather than catalysis

Thus in our opinion octahedral zinc is the centre of the ternary complex, although there have been suggestions previously that, like the protein, it is not joined to the substrates[25,26], but to the coenzyme pyrophosphate groups[26] The tertiary structure of LADH seems to depend on SH-groups[1], and, while the coenzymes bind to the enzyme through adenine, SH-bonds in addition seem necessary with DPNH, but not DPN, where there is the zinc–N+ interaction The amide group is not considered joined to the zinc, nor necessarily to the protein at another site, as the protein SH-addition to the pyridine ring in DPNH and the pyridinium–zinc bond in DPN can give the ring its necessary stereospecific rigidity[27]

This mode of bonding gives an explanation of how enzymes cause coenzymes and substrates to select, with great preference, their active reaction partners, while substances like imidazole, which can stimulate reaction at high substrate concentrations and inhibit at low substrate concentrations, could be physiologically significant in having a homeostatic function to maintain substrates at a suitable concentration An excess would be removed rapidly, but the process would be inhibited strongly when lower concentrations were reached

ANTIGEN-ANTIBODY PRECIPITATION CONTRASTED IN GELS OF HIGH AND PHYSIOLOGICAL SALT CONCENTRATIONS

By Dr ALFRED J. CROWLE and DAVID C LUEKER

Division of Immunology, Webb Institute for Medical Research, and Department of Microbiology, University of Colorado School of Medicine, Denver

RABBITS are the usual source of supply of precipitins for serological analyses. The chicken, however, is becoming increasingly popular for this purpose as an animal both readily housed in the laboratory and able to provide volumes of antiserum matching those produced by rabbits[1] The use of chicken antiserum in precipitin tests performed in liquid medium has led to the discovery that it differs from rabbit antiserum in usually, although not always, precipitating antigen optimally in electrolyte solutions of 10–12 times higher ionic strength than that of physiological saline[2] At these high electrolyte concentrations, specific precipitation of antigens by mammalian antisera is grossly inhibited[3]. The recent rise in popularity of chicken antiserum also has extended to its utilization in immunodiffusion tests, that is, in antigen-antibody precipitin tests carried out in gels. We wish to show here that it is false to deduce that if high salt concentrations are optimal for chicken precipitin reactions in liquid media they also must be in semi-solid media. Indeed, not only do physiological electrolyte concentrations seem to offer considerably better conditions than high concentrations for immunodiffusion tests with chicken antisera, but also at high salt concentration in these tests the chicken precipitin reaction is as much inhibited as that of mammalian antisera.

Bovine serum albumin (Armour 'Fraction V' from bovine plasma) was used as antigen for the experiments reported here. Although in this, albumin is the predominating antigen, immunodiffusion experiments with strongly hyper-immune antiserum show that it contains at least 6 other independent antigens (Fig. 1). Since the reaction of each of these with its particular antibody can be resolved and identified in these tests, our results apply at least to these 6 independent antigen-antibody systems examined simultaneously under identical conditions. By chance it happens that at least 2 other antigens also are involved, as constituents of chicken serum (Fig. 1, arrow), bringing the total of antigen-antibody systems at least to 8.

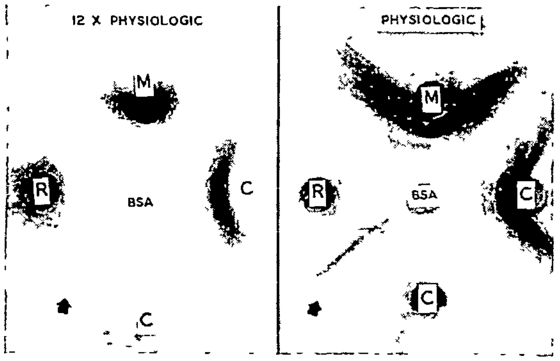

Fig. 1. Comparison in micro-immunodiffusion tests of specific precipitation produced against bovine serum albumin (*BSA*) by chicken (*C*), mouse (*M*) and rat (*R*) antisera at twelve times physiological and at physiological electrolyte concentrations. Arrow points to precipitin bands formed between rat serum and a chicken serum and presumably due to antigens found in the latter, for the rat had been immunized, in addition to *BSA*, with chicken ovalbumin, a preparation known to contain antigens in common with adult chicken serum

Mammalian antiserum is represented by mouse and rat sera; in respect to the purposes of the present investigation we have found them equivalent to comparable antisera obtained from rabbits and guinea pigs. Serum from these two species was used partly to emphasize the not widely known fact that both are useful precipitin producers. Animals from which antiserum was obtained had been vaccinated subcutaneously with water-in-oil emulsions of bovine serum albumin containing living avirulent (*H37Ra* strain) tubercle bacilli as adjuvant. For example, an animal was injected with 0.1 ml of emulsion containing 1 mgm of antigen and 1 mgm of bacilli. The injection was repeated a week later, and bleedings for antiserum were performed two weeks after the second injection. Our basic requirement was that an antiserum produce readily detectable specific precipitate with its antigen, and it has been satisfied most regularly by this particular immunizing procedure. However, several variations in vaccination protocol have been made, including deletion of water-in-oil emulsion during vaccination, without altering the basic facts pointed out here regarding mammalian antiserum and salt concentration in precipitin tests.

Chicken antisera were obtained by essentially the same procedures, although antigens were used in quantities five times larger. Again, however, vaccination procedures purposely were varied, including whether emulsions were used, to learn whether they conditioned qualitatively the results which were obtained. As among mammalian antisera, they did not. For experiments reported here, two chicken antisera were used, one of high precipitin content and the other with a content barely detectable in micro-immunodiffusion tests.

The crux of our experiments was to discover whether chicken antiserum which precipitates antigen better in aqueous medium at high electrolyte concentrations than at low also would in semi-solid medium, and how this would compare with findings for typical mammalian antisera. Therefore, it was necessary to show that chicken antisera which were to be used did indeed form more precipitate with antigen in high electrolyte concentrations and that mouse antiserum precipitated antigen best at physiological concentration. Optimal proportions for test antisera with antigen were determined at physiological and twelve times physiological salt concentration by timing the appearance of precipitates at the interfaces, in the classic ring test in aqueous medium, in series of tubes in which constant quantities of antisera were overlaid with varying dilutions of antigen. In both this and most immunodiffusion tests, the *p*H of diluent was held at 7.4 with sodium barbital buffering[4], electrolyte strength was varied solely by changes in sodium chloride concentration. Then, 1 ml volumes of antigen and antibody, used at their predetermined optimal precipitating ratios, were mixed in centrifuge tubes and allowed to stand for 1 hr at room temperature and then for 12 hr at 4° C. Specific precipitate was centrifuged out at 4° C and 41,000*g* applied for 30 min, washed twice with the same kind of buffer as used for specific precipitation, and quantitated with Boyd's technique for the Folin–Ciocalteu phenol reagent[3]. These tests established that mouse antiserum yielded 20 per cent as much specific precipitate at high salt concentration as at physiological, while chicken antiserum yielded 5 times as much at high as at low. With the classic responses of these respective antisera clearly established, their respective activities in immunodiffusion tests were next investigated.

Numerous immunodiffusion tests, most of them of micro type[5], were set up using these and other antisera and varying for them not only electrolyte concentrations but also the time of reaction development, temperature (4° or 24° C), type of buffering agent, purity of agar, and type of gel. The results from these experiments were consistent: like mammalian antiserum chicken antiserum produces heavier precipitin bands in larger numbers and more rapidly at salt concentrations equal to or close to physiological than it does at concentrations 10 or 12 times this, in which by contrast they react so well in aqueous media. Typical findings are illustrated in Fig. 1.

Our findings agree with those recently shown photographically for chicken antisera by Makinodan *et al.*[6], who also used bovine serum albumin antigen, but they are at variance with the assertions of Goodman[7] regarding the detection of certain human γ-globulin antigens with such antisera. Although possibly chicken antisera precipitate certain antigens in semi-solid media better at high salt concentrations than at low, just as they obviously do in liquid media, the present experiments suggest that this is the exception rather than the rule. Thus, none of the several antigen-antibody systems shown in Fig. 1 precipitated better (usually not at all) at high salt concentration. Precipitin band curvature for these suggests[1] that the molecular weights of antigens involved ranged from that of bovine serum albumin through that equivalent to mouse, chicken, and rat antibodies (that is, 65,000–180,000). However, in more extensive experiments at present being carried out, we are examining the possibility that human or other γ-globulin antigens reacting with chicken antiserum may indeed, because of some peculiarity of their own, precipitate better in immunodiffusion tests, as in aqueous precipitin tests, at high rather than at low electrolyte concentrations.

At present, we attribute the difference which we have found between liquid and gelled media in connexion with salt concentrations and chicken antiserum precipitin effectiveness to at least two significant differences between the physics of specific precipitation in the two media. One is that in the former, antigen and whole antiserum mix all at once mechanically, by convection, and by diffusion, while in the latter antigen and antibody, separated to some extent from other serum constituents, mix only by diffusion. The other is that in a gel antigen-antibody complexes probably are immobilized shortly after they form, so that if they have tendencies either to dissociate again or to cease growing larger, whence they might fail to precipitate in aqueous medium, these are counterbalanced by surrounding gel[8].

A few additional remarks concerning our experiments are appropriate. Inhibition of specific precipitation by mammalian and chicken antisera at high salt concentrations in semi-solid media occurs in both macro and micro double diffusion tests, although it is more obvious in the latter test because of its ability to resolve more individual precipitin bands. This inhibition occurs to similar extents in highly purified[4] as well as unpurified Difco 'Bacto' agar and in gelatin, and it is present in either barbital- or phosphate-buffered saline solutions. Superficially it seems to be greater in barbital-buffered solutions because these tend to provide resolution of precipitin bands superior to that realized with phosphate-buffered solutions.

ACTION OF DEOXYRIBONUCLEASE AND RIBONUCLEASE ON THE GROWTH OF EHRLICH ASCITES CARCINOMA IN MICE

By Dr. GASTON DE LAMIRANDE*

Institut du Cancer de Montréal, Laboratoires de Recherche, Hôpital Notre Dame, et Université de Montréal

THERE are few reports in the literature on the action of enzymes on cell growth. In tissue cultures, addition of deoxyribonuclease (DNAase) and ribonuclease (RNAase) affected the mitotic rate and the metabolism of the nucleic acids[1–6]. Haddow *et al.* have shown that *in vivo* xanthine oxidase had a definite action on the growth of spontaneous mammary tumours in mice[7,8] and Ledoux and Bergel have demonstrated that tumour growth was depressed by ribonuclease[9–11]. In relation with the above-mentioned facts, it is of interest that DNAase and RNAase activities could not be demonstrated in a variety of experimental and human tumours[12]. An *in vivo* study of the effect of DNAase, RNAase and xanthine oxidase on regenerating rat liver has shown that DNAase and xanthine oxidase affected significantly the proportions of the various mitotic phases whereas ribonuclease did not[13]. This situation prompted me to investigate the effect of DNAase on growth of tumours and to re-investigate further that of RNAase.

Swiss mice of an average body-weight of 20 gm were used. Ehrlich carcinoma in ascites form was transplanted intraperitoneally using 0·5 ml. of ascitic fluid containing an average number of 65 million cells. The total number of cells was determined as follows: the mice were killed by breaking their necks, their abdomens were skinned and a needle was introduced at the top of the abdominal cavity. The ascitic fluid was drawn out with a syringe, and the cavity was washed four times, once with 2-ml. and then with 1-ml. portions of 0·85 per cent sodium chloride solution. The ascitic fluid plus the washing liquid was adjusted to an exact volume and the cells were counted in an hæmatocymeter after staining with orcein[14].

Smears of ascitic fluid were prepared for metaphase counts and cytological examinations. They were stained by the Feulgen method[15] and, on some occasions, counterstained with methyl green[16]. At least 3,000 cells were counted at random to determine the incidence of metaphase.

In all the assays reported here the control mice were injected intraperitoneally daily with 0·5 ml. 0·85 per cent sodium chloride in a similar manner. Each morning the deaths were recorded in order to establish the survival-curves of both the control and the treated mice.

Deoxyribonuclease. Fig. 1 shows the percentage number of surviving mice in relation with time. The control and treated mice were injected daily from

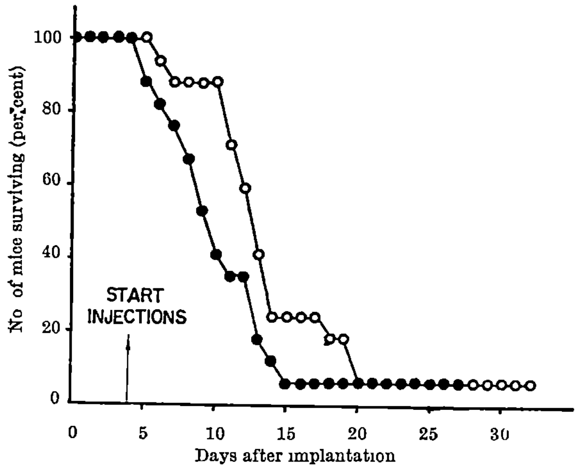

Fig 1 Effect of injections of DNAase on Ehrlich ascites carcinoma Mean life controls, 9 8 ± 3 2, treated, 13 1 ± 3 5 Increase, 34 per cent

the fourth day after implantation of the tumour except on the tenth and seventeenth day There were 17 mice in each group The curves show that when 50 per cent of the controls were dead, 88 per cent of the treated mice were still alive The mean life of the controls was 9 8 ± 3 2 days whereas the treated mice lived on the average 13 1 ± 3 5 days This increase of 34 per cent in the survival-time was statistically significant at a level better than 98 per cent

In each group there was a mouse still living 33 days after the transplantation of the tumour These mice were killed and examined The mouse in the control group did not show any apparent sign of tumour whereas the mouse of the treated group had a tumour mass of 1 5 cm in diameter

Fig 2 shows the survival-curve of the control and treated mice for an experiment in which the treatment was started on the day following the transplantation of the tumour The groups contained 10 and 9 mice respectively and the animals were injected daily When 50 per cent of the controls were dead, all the treated mice were alive The mean life of the controls was 7 2 ± 2 9 days whereas the treated mice lived 12 0 ± 3 6 days This increase of 67 per cent in the survival-time is statistically significant at a level better than 99 per cent

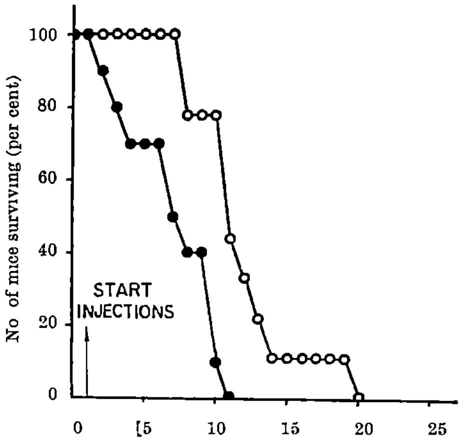

Fig 2 Effect of injections of DNAase on Ehrlich ascites carcinoma Mean life controls, 7 2 ± 2 9, treated, 12 0 ± 3 4 Increase, 67 per cent

Thus the injection of DNAase one day after the transplantation of the tumour instead of the fourth day doubles the increase in survival-time

From these results it would seem that DNAase exerted an action on the growth of Ehrlich ascitic carcinoma, and that the magnitude of this action depended on the time the injections were started following the transplantation of the tumours

The action of DNAase on the growth of Ehrlich ascites tumour cells was also ascertained by counting the total number of cells in control and treated mice The incidence of metaphase was also determined The mice were injected daily for four days starting the day following the transplantation of the tumour Table 1 shows that the total number of cells in the treated mice was one-third that of the control mice The number of cells in the controls from the day of transplantation to the fifth day, increased nearly six times whereas in the treated mice it increased only four-fold The incidence of metaphase in the treated mice was only one-half that in the controls, indicating that cell division was impaired in the presence of the injected DNAase

Table 1 EFFECT OF DNAASE ON CELL NUMBER AND INCIDENCE OF METAPHASE IN EHRLICH ASCITES CARCINOMA

Animals	Days	Total No of cells ($\times 10^{-6}$)	Incidence of metaphases
Controls	0	56	1 5 ± 0 3
	5	320	
Treated	0	56	
	5	230	0 7 ± 0 3

Daily injections of enzyme started the day following the implantation of the tumour

The action of the injected DNAase on the deoxyribonucleic acid of the cells was followed by Feulgen staining Examination of Feulgen-stained smears of tumour cells from control and treated mice indicated that the nuclei of the tumour cells from the treated mice were not stained at all or were much less stained than those from the controls This shows that some deoxyribonucleic acid of these cells was most probably destroyed by the enzyme A large number of cells also contained Feulgen-positive material in their cytoplasm

These facts seem to indicate that the injected DNAase acts on the growth of the tumour, impairing cell division by attacking deoxyribonucleic acid Similar results were obtained by Chevremont *et al* [2-5] on the action of DNAase in tissue culture These authors reported that DNAase impaired the growth of fibroblasts and myoblasts of chicken embryos in tissue culture and stopped cell division A lack of DNA was observed in the nucleus and some found in the cytoplasm

The activities of five enzymes of the purine-catabolizing enzyme system have been determined as previously described[17] in control and treated mice to gain information on the possible effect of DNAase injections since the enzyme seemed to depolymerize the deoxyribonucleic acid of the cell Table 2 shows that the activities per average cell of 5-adenylic acid nucleotidase, inosine phosphorylase, guanase, xanthine oxidase and uricase were very low in Ehrlich ascites tumour cells, even lower than in primary liver tumours or Novikoff hepatoma[17,18] Injections of DNAase for four consecutive days did not seem to affect the activities of these enzymes except for 5-nucleotidase, which was increased about

Table 2 EFFECT OF DNAASE ON PURINE CATABOLIZING ENZYMES IN EHRLICH ASCITES CARCINOMA

Enzymes	Activity in μM/min /cell (× 10^9) Controls	Treated
Uricase	0	0
Xanthine oxidase	0 021 ± 0 013	0 024 ± 0 009
Guanase	0 24 ± 0 10	0 21 ± 0 11
Inosine phosphorylase	1 43 ± 0 37	1 14 ± 0 42
5-nucleotidase	0 38 ± 0 21	2 13 ± 0 70

six-fold However, this activity was still so low that the significance of this increase was questionable It would thus seem that, under the present conditions, the catabolism of purine or purine derivatives was not affected

Ribonuclease Fig 3 shows the percentage number of surviving mice in relation with time The injections were started the day following the transplantation of the tumour Both groups contained thirty mice, and the animals were injected daily It can be seen from the curves that the period of 50 per cent death was the same for the two groups The mean life of the controls was 8 3 ± 3 9 days whereas the treated mice lived on for 10 1 ± 4 5 days This increase of 22 per cent in the survival-time was not statistically significant

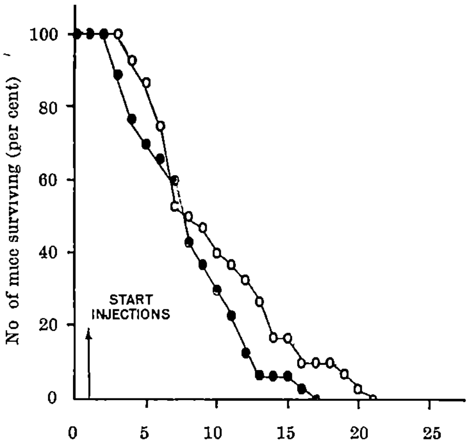

Fig 3 Effect of injections of RNAase on Ehrlich ascites carcinoma Mean life controls, 8 3 ± 3 9 , treated, 10 1 ± 4 6 Increase, 22 per cent

To ascertain that the difference between the action of RNAase and DNAase was not due to a lack of penetration of the RNAase in the cells, ribonuclease activity of the ascites cells and of the ascitic fluid from control and treated mice has been determined Immediately after withdrawal of the fluid with a syringe, the cells were centrifuged and re-suspended in sodium chloride, and RNAase activity was determined on both cell suspension and supernatant as previously described[19] Table 3 shows that the RNAase activity, either at acid or alkaline pH, was the same for both the supernatant and the cell re-suspension for the controls For the treated mice, however, the enzyme activity of the cell re-suspension was more than twice that of the supernatant Furthermore the ribonuclease activity, measured at acid pH, of the treated cells was nearly five times that of the control cells, and the activity, measured at alkaline pH, nearly seven times This indicated that the injected enzyme penetrated inside the cells as shown by Ledoux and Pileri[20] and that the lack of effect on tumour growth was not due to a lack of penetration of the enzyme

Table 3 EFFECT OF RNAASE INJECTION ON THE ENZYME-LEVEL OF THE CELLS

	Ribonuclease activity* Acid Controls	Treated	Alkaline Controls	Treated
Supernatant	0 070	0 127	0 110	0 426
Cells	0 058	0 262	0 134	0 902

* Expressed in O D

The lack of action of RNAase on the growth of Ehrlich ascites carcinoma does not confirm previous results of Ledoux, who reported significant effect of the enzyme on the growth of this tumour[9] However, this might be due to a different source of RNAase since Ledoux has shown that the biological activity of different RNAases from various sources varied tremendously Furthermore, the tumour inoculum, in the present work was much larger than that employed by Ledoux and the injected dose of RNAase was much smaller

Conclusions Injections of DNAase increased the survival-time of mice bearing the Ehrlich ascites carcinoma by 34 and 67 per cent, depending on the time the injections were started following transplantation This increased survival-time was accompanied by a decreased metaphase index and by the disappearance of deoxyribonucleic acid from a number of cell nuclei The injections of DNAase had no effect on the activities of five enzymes involved in the catabolism of purine and purine derivatives

Injections of RNAase had no significant action on the survival-time of mice bearing Ehrlich ascites tumour This lack of action was not due to a lack of penetration of the enzyme inside the tumour cells

VACUOLATION AND LEAF REGENERATION IN *SPLACHNUM AMPULLACEUM* (L.) HEDW.

By Prof KRAFT E von MALTZAHN
Botanical Laboratories, Dalhousie University, Halifax, N S , Canada

Formation of Secondary Vacuoles in De-differentiating Cells

IT was shown in ref 1 that cellular de-differentiation in *Splachnum* involves profound changes in the intracellular configuration, one of the first signs of this is the formation of intravacuolar cytoplasmic lamellæ leading to systrophe This communication is concerned with the formation of these intravacuolar cytoplasmic layers and some considerations arising from these observations

Plant material and methods are the same as described in ref 2 Leaves isolated from three-week-old plants were, however, transferred into liquid Beijerinck solution adjusted to *p*H 6 8 Regeneration takes place readily from isolated leaves at this *p*H

Fig 1 represents a composite drawing of a leaf cell in cross-sectional view parallel to the leaf surface showing various stages in the development of the primary cytoplasmic lamellæ It is evident that these lamellæ originate in the form of secondary vacuoles These vacuoles are formed in various parts of the peripheral cytoplasm, predominantly in the vicinity of the nucleus One secondary vacuole expands initially into the central vacuole and moves about considerably until it reaches ultimately the peripheral cytoplasm across the vacuole Fusion of separate intravacuolar cytoplasmic layers appears to take place not infrequently Lamellæ may originate also in the form of a secondary vacuole from the peripheral cytoplasm opposite the nucleus expanding toward the nucleus Secondary vacuolar formation continues over considerable periods of time from other sites of the peripheral cytoplasm during and after the formation of the primary intravacuolar cytoplasmic lamellæ

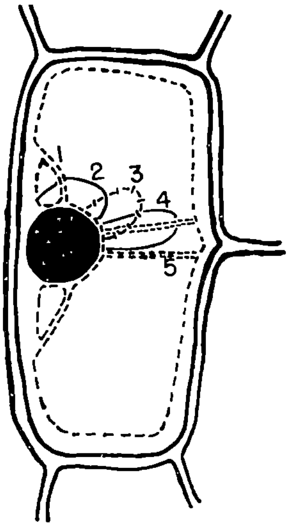

Fig 1 Composite drawing of leaf cell (marginal position) showing formation of primary intravacuolar cytoplasmic lamellæ The numbers represent successive stages in the expansion of a secondary vacuole

The pattern described is characteristic of cells near the leaf margin In other portions of the leaf, only one primary intravacuolar lamella is formed initially, originating in the form of a secondary vacuole from the peripheral cytoplasm, frequently not in the vicinity of the nucleus

The similarity between secondary vacuole formation in de-differentiating cells and that in plasmolysed cells should be noted Haberlandt[3-5] observed intravacuolar lamellar structures in plasmolysed cells and his observations were fully confirmed by those of Pfeiffer[6] Both Haberlandt and Pfeiffer found cellulose incorporation into the intravacuolar lamellæ Kuster[7] has been unable to confirm this incorporation, and doubts, therefore, that intravacuolar formation of lamella has anything to do with cross-wall formation or cell-division Although the present work has not been concerned with this question, cellulose incorporation is unlikely to occur up to the time of phragmosome formation and would appear to be restricted to it Haberlandt[5] suggested, on the basis of his interpretation of the nature and fate of the lamellæ, that divisional substances are normally present in cells which increase in concentration following the decrease in water concentration resulting from the plasmolytic treatment of the cell Division, according to Haberlandt, may set in, once a critical concentration in divisional substances has been reached The present results make this explanation unlikely since plasmolysis and, therefore, loss of water do not appear to take place and since primary intravacuolar cytoplasmic lamella formation does not represent division Pfeiffer[6] concluded on different grounds that Haberlandt's proposed mechanism can at least not be the primary one

Kuster[8] has discussed the ontogeny of intravacuolar lamellæ in plasmolysed cells and concluded that they are the result of a process of furrowing of the primary vacuole and do not arise as a result of secondary vacuole formation from the peripheral cytoplasm This conclusion cannot be maintained considering the present results and those of Wartenberg[9] Wartenberg has recently given strong evidence that plasmolysis represents an active swelling process, that is a process of active vacuole formation in the outer peripheral cytoplasm The present observations on early stages of secondary vacuole formation resemble Wartenberg's on secondary vacuoles arising in plasmolysed cells Similarities between changes in the intra-cellular configuration of de-differentiating cells and that of plasmolysed cells have been noted earlier[2] The resemblance between the formation of a secondary vacuole in plasmolysed cells and in non-plasmolysed but de-differentiating cells stressed in the present discussion appears to be significant It may be suggested that plasmolytic treatment results in the initiation of cellular de-differentiation This is supported by observations, for example, Isaburo, Nagai[10], that plasmolysed cells may regenerate, that is de-differentiate and re-differentiate, when the plasmolytic treatment is followed by deplasmolysis Secondary vacuole formation would then generally represent early stages in the process of cellular de-differentiation It may not be sufficient to explain the colloid chemical behaviour of the cell in terms of an interaction between the cell and the environment (for example, plasmolyticum), it may rather have to be considered also in terms of the interaction between different cells or the lack of it, that is, in terms of the correlative influences between different parts of the organism

Effect of Kinetin on Attached Leaf Regeneration

It has been shown recently[11] that the realization of regenerative potentialities in cells of a leaf attached to a stem segment isolated from a gametophore is inhibited by this stem segment, while the presence of the attached leaf increases regeneration from cells of the stem segment In the course of an investigation into the nature of this correlation system, the effects of locally applied kinetin have been investigated

Stem segments with one attached leaf from which the distal third was removed were isolated from the middle region of the gametophore, one segment for each gametophore They were planted on Beijerinck's medium solidified with 2 per cent agar with various concentrations of kinetin added, only the region near the wound surface of the attached two-thirds leaf being in contact with the medium They were grown under continuous white light provided by daylight fluorescent lamps. Gametophores used were always 20–21 days old

The number of protonematal regenerates for the attached two-thirds leaf was determined three days following planting and the results are shown in Fig 1 Regeneration is almost absent in attached leaves planted on the medium without kinetin In the presence of certain kinetin concentrations, however, attached leaf regeneration is promoted It should be noted that the effective concentration range shown in Fig 2 was obtained only with freshly dissolved kinetin Kinetin dissolved and kept in the refrigerator showed effectiveness only at higher apparent concentrations Kinetin locally applied to the distal end of the attached leaf may therefore overcome, to some extent, inhibition of attached leaf regeneration The stem segment represents apparently a region of attraction for substances essential for regeneration and produced predominantly by the leaf The drainage of the leaf by the stem prevents attached leaf regeneration while it promotes regeneration from the stem segment Basipetal transport of these substances is locally counteracted in the leaf by kinetin application, transport taking place also toward the site of kinetin application leading to regeneration in cells near this site

This suggestion is supported by the following experimental observations When intact gametophores are grown on Beijerinck's medium containing twice the normal ammonium nitrate concentration, increased regeneration takes place from a two-thirds leaf attached to a stem segment in the absence of kinetin It appears that in this case nitrogenous compounds are produced at higher concentrations and that basipetal transport of these substances from the leaf toward the stem segment does not lead to concentrations in the leaf limiting regeneration

The present concept of the nature of the correlation system and kinetin action described here is supported by the original observations by Richmond and Lang[12] and the extensive investigations by Mothes *et al* [13] on the effects of kinetin on the directional transport of soluble nitrogenous compounds Localized application of kinetin in isolated leaves of *Nicotiana rustica* led to a localized accumulation and retention of soluble nitrogen compounds against concentration gradients, these substances being available for renewed protein synthesis Since regeneration involves increased synthetic activities, particularly in terms of proteins (see ref 14 for present material), such accumulation would appear to be significant also for regeneration In Heitz's view[15], accumulation of sugars is the most important factor for the initiation of regeneration in isolated leaves Although regeneration did not result, he obtained increases in nuclear size by applying sucrose to leaves Stange[16] observed a dependence of increases in size of nucleus in regenerating cells of *Riella* on length of periods of photosynthesis

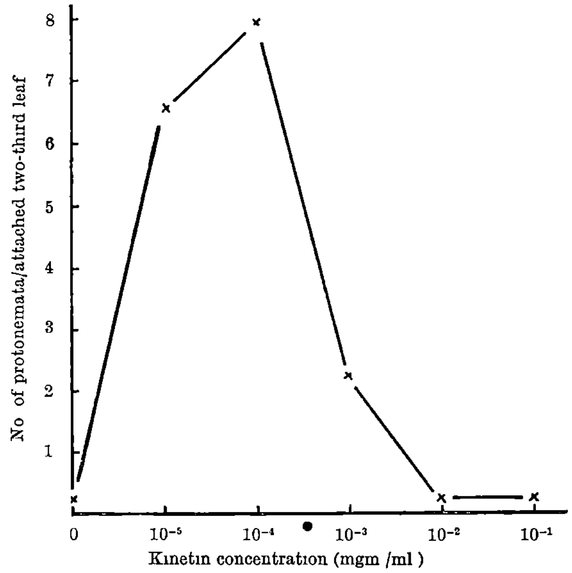

Fig 2 Protonematal regeneration from two-thirds leaves attached to a stem segment in the presence of various concentrations of kinetin

The present interpretation of the system described here may have wider applications for correlations inhibiting the realization of regenerative potentialities and the distribution of processes of dedifferentiation taking place in normal plant development[14]

LETTERS TO THE EDITORS

COSMOLOGY

Dirac's Cosmology

DIRAC's cosmology was based on the principle "that any two of the very large dimensionless numbers (of the order 10^{39} and 10^{78}), occurring in Nature, are connected by a simple mathematical relation in which the coefficients are of the order of magnitude unity"[1] From this principle Dirac deduced that the gravitational 'constant' $G \propto (\text{epoch})^{-1}$ In order to describe a cosmological model according to the principles of the general theory of relativity he then changed the units of distance and time so as to make G constant With the new units the metric can be written

$$ds^2 = c^2 dt^2 - R^2(t)\,(dx^2 + dy^2 + dz^2) \qquad (1)$$

with $R(t) = t^{2/3}$ Afterwards I considered this model, and by making certain assumptions, which appeared reasonable, obtained $G \propto \frac{1}{t}$, $t \approx 4 \times 10^9$ years[2]. This gives the values

$$H \approx 160 \text{ km /sec /}10^6 \text{ parsec}, \; q = -0\;5 \qquad (2)$$

for Hubble's constant $H\left(= \frac{R}{R}\right)$ and the acceleration parameter $q\left(= \frac{RR}{R^2}\right)$

Recently, L Egyed[3] has proposed a theory of the origin of the solar system which uses these results $\left(G \propto \frac{1}{t}, t \approx 4 \times 10^9 \text{ years}\right)$, and P Hédervári[4] has used the same results in a theory of the internal structure of the Moon My main object in this communication is to point out that the assumptions made in these interesting theories are not necessarily associated with the values of H and q given above, but may also give the values

$$H \approx 80 \text{ km /sec /}10^6 \text{ parsec}, \; q = -2 \qquad (3)$$

from a different description of the Dirac model in Riemannian space-time It seems advisable to point this out, since the empirical values of H and q may soon be sufficiently accurate to be able to distinguish between (2) and (3)

Rindler[5] shows how cosmological models, including those which are not described according to the principles of the general theory of relativity, may be described in Riemannian space-time, and he gives a metric for the Dirac model of the form (1) with $R(t) = t^{1/3}$ This method of discussing the model is based on the results derived from Dirac's principle, and does not provide a theory of gravitation for the model Recently, however, I have shown that a theory of gravitation with $G \propto \frac{1}{t}$ may be based on field equations derived from a principle of stationary action[6] In that theory the characteristic metric was (1) with $R(t) = t^{1/3}$, and the gravitational theory may therefore be associated with the Dirac model If one assumes $t \approx 4 \times 10^9$ years, this description of the Dirac model gives (3) for H and q

When one considers the empirical values of H and q it is of interest to observe that McVittie[7] discussed the observational results available up to July 1955 and found values for H of 143–227 km /sec /10^6 parsec Later, Sandage[8], in studying galaxies in the Virgo cluster, found that Hubble mistook glowing H II regions for brightest stars and, by applying corrections to Hubble's data, found that H can range between 50 and 100 km /sec /10^6 parsec with a very large uncertainty De Vaucouleurs[9] suggested that the local group is part of a super cluster of galaxies, and, by making allowance for the velocity of our own system which would occur on account of the differential rotation and expansion of the cluster, he obtained the value $H \approx 140$ km /sec /10^6 parsec The empirical value of q is also very uncertain at present Humason, Mayall and Sandage[10] give $q = -3\;0 \pm 0\;8$ and Baum[11] finds from photoelectric determinations of red shifts that q has a value in the range $-0\;5$ to $-1\;5$

Thus it would appear that no definite conclusions can be reached from consideration of the empirical results, and that the values of H and q given by either (2) or (3) are within the ranges of these results

Finally, consider the assumption that $t \approx 4 \times 10^9$ years, in relation to some recent astrophysical calculations Hoyle[12] has estimated the time required for the evolution of certain stars as $> 10^{10}$ years, but in his calculations he has taken $G =$ constant, whereas in the Dirac model $G \propto \frac{1}{t}$ Hoyle's figures are not, therefore, strictly comparable with the assumption that the age of the universe $\approx 4 \times 10^9$ years This age is, however, too small to allow time for the synthesis of the heavy isotopes of uranium in a star ($\approx 6\;6 \times 10^9$ years), by the process described by Burbidge, Burbidge, Fowler and Hoyle[13]

I am indebted to Dr G J Whitrow for information concerning the empirical results

RADIOPHYSICS

Spectral Characteristics of Type II Solar Radio Bursts

IT has been recognized for some time that Type II solar radio bursts are due to the excitation of plasma oscillations in the solar corona by some exciting agency which moves through the corona. Roberts[1], in reviewing observations and theories of these phenomena, leaves unexplained two salient characteristics: (1) the appearance of radiation at the fundamental and second harmonic at comparable powers and the lack of radiation at all higher harmonics; (2) the frequent splitting of each of these two 'lines' into a pair of lines, the fractional splitting of each of these two pairs being the same, typically a few per cent.

Plasma oscillations are inherently non-radiative, so that we must ascribe our observation of these oscillations to their coupling to electromagnetic waves. In a homogeneous plasma, such coupling occurs only through non-linearity of the field and dynamical equations. It has been pointed out elsewhere[2] that the dominant coupling process is between two plasma-oscillation modes and one electromagnetic wave, which leads to radiation at $2\omega_p$, that is, twice the plasma frequency ω_p, where $\omega_p{}^2 = 4\pi ne^2/m$, and that this is the key to understanding of point (1). The next most important non-linear process couples three plasma-oscillation modes and one electromagnetic wave, and leads to radiation at ω_p and at $3\omega_p$ with comparable intensities. Since the third harmonic is not observed, we may conclude that the plasma-oscillation amplitude (measured as a fractional change in electron density) is small, and that emission at the fundamental is not due to non-linearity. Radiation at the fundamental may be ascribed to inhomogeneity of the coronal plasma, due to thermal fluctuations, to turbulence, or to a shock wave associated with the exciting agency.

In order to understand point (2), we should now consider the plasma to be permeated by a magnetic field. In the 'electrostatic' approximation, $\omega/k \ll c$, the dispersion relation has the form

$$\omega^2 = \tfrac{1}{2}\left[\omega_p{}^2 + \omega_g{}^2 \pm (\omega_p{}^4 + \omega_g{}^4 - 2\omega_p{}^2\omega_g{}^2\cos 2\theta)^{1/2}\right]$$

where θ is the angle between the wave vector k and the magnetic field vector B, and ω_g is the electron gyro-frequency eB/mc. It is noteworthy that ω does not depend on $|k|$. For $\omega_g < \omega_p$, this separates into two bands, one extending from 0 to ω_g and the other from ω_p to $(\omega_p{}^2 + \omega_g{}^2)^{1/2}$, the former of which one would not expect to radiate through the corona. Since one observes two closely spaced frequencies rather than a wide band, we must inquire whether some modes of the upper band are more strongly excited than others.

The significance of group velocity in the problem of the excitation of waves in a plasma by a moving source of finite dimensions has been recently discussed[3]. The problem may be regarded as that of the excitation of a resonator by an aperiodic force, and we know that the excitation varies proportionately with the Q of the resonator. Modes of highest Q will be those which lose their energy most slowly. If the wave-number spectrum and the dimensions of the source are subject to certain limitations, then loss of energy radiation, by electron-ion collisions and by Landau damping, will be subordinate to loss of energy by convection, a process which is characterized by the group velocity. We then expect that the most highly excited modes will be those of lowest group velocity.

By setting $\partial\omega/\partial k_x = \partial\omega/\partial k_y = \partial\omega/\partial k_z = 0$, we may find the modes of zero group velocity. Since ω here depends only on θ, the condition reduces to $d\omega/d\theta = 0$, which is satisfied at $\theta = 0$ and at $\theta = \pi/2$. Hence, considering only the upper band, we should expect the frequencies ω_p and $(\omega_p{}^2 + \omega_g{}^2)^{1/2}$ to be preferentially excited. It is proposed that these are the two frequencies to be identified with the pair of frequencies of the observed spectrum when it is split. The separation is seen to be approximately $\tfrac{1}{2}\omega_g{}^2/\omega_p$. This leads typically to estimates of 20 gauss for the strength of the magnetic field in the region associated with the beginning of a Type II burst.

The above interpretation of the spectral characteristics of Type II bursts would make it possible to obtain, from observations, information about the magnetic field in the solar corona.

The observed frequency ratio of 'first harmonic' to 'fundamental' is slightly less than 2:1. This effect has been attributed[4] to the propagation characteristics of the corona. It may be due in part to differences between the coupling mechanisms for certain forms of the plasma oscillation and inhomogeneity spectra, one finds that radiation at the fundamental is due to a band of wave numbers, and hence of frequencies, higher than that due to radiation at the second harmonic, thermal velocities of the plasma electrons now being taken into account.

An amplified version of the above arguments and a discussion of the nature of the exciting agencies of Type II and Type III bursts will be given in a forthcoming article.

Decimetre Radio Bursts Concurrent with Solar Type IV Radiation

IT is known that when there is an important H_α flare on the Sun's disk there is often considerable radio emission over a wide band of frequencies. While the spectrum at metre wave-lengths is relatively well understood, the decimetre and centimetre radio bursts have not been related very clearly to the overall spectrum.

Especial interest is attached to the broad-banded centimetre and decimetre radiation that occurs concurrently with the metre wave-length continuum emission, known as Type IV radiation, and thought to be 'synchrotron' emission. Takakura[1] suggested that the microwave emission might be an extension of the metre wave-length Type IV spectrum to shorter wave-lengths.

From many observations of 1,420-Mc./s. solar radio bursts with the Christiansen crossed-grating interferometer used to provide a fan-beam (2′ of arc to half-power in the east–west direction) we have chosen for study eight occasions characterized by intense Type IV activity at metre wave-lengths

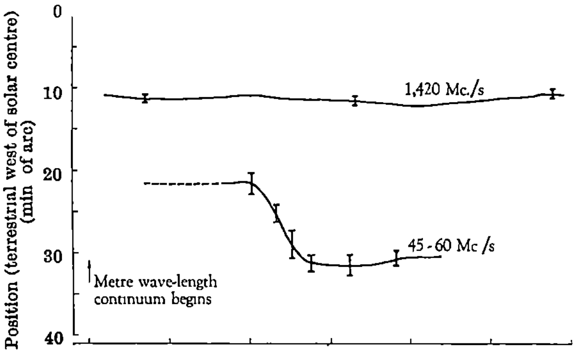

Fig 1 Position of decimetre and metre wave-length sources, July 29, 1958

Accurate estimates of position were obtained at 4-min time intervals, and were compared with the position of the Type IV source in the frequency range 45–60 Mc /s While the metre wave-length sources were located in the high corona, the 1,420-Mc /s sources remained at rest in the chromosphere or lower corona, probably at the same height as the H_α flares and certainly not more than about 50,000 km. above them The positions of the microwave burst and the flare were always closely coincident The low-frequency sources showed large-scale movements (presumably outward) on two occasions (one of which is shown, Fig. 1), while the decimetre source was stationary

Typical sizes of the 1,420-Mc /s sources were 2′–5′ of arc, and brightness temperatures of 10^8–10^9 ° K, were observed concurrently with the Type IV continuum at lower frequencies, indicating a non-thermal mechanism at decimetre wave-lengths.

Since the decimetre burst and the metre wave-length Type IV source are located at widely different parts of the solar atmosphere they must be different This conclusion supports a recent view of Takakura and Kai[2], who suggest, from spectral considerations at 4,000-Mc /s, that the microwave bursts "are not the high-frequency component of Type IV bursts on metre-waves but another distinctive type of burst emitted from radio sources fixed in the coronal condensations"

These results were first presented at an Institute of Physics Symposium (Brisbane, May, 1961)

PHYSICS

Gravitational and Electrostatic Forces

In a recent communication[1], it was pointed out that dimensional difficulties met with in the usual gravitational equation $F = GM^2L^{-2}$, where F is the attractive force and G the gravitational constant, are avoided if the mass of a body is replaced by N_1e, where N_1 is the number of positive (or negative) charges contained in the body and e is the elementary charge It then follows that for two bodies placed a distance r apart and containing N_1 and N_2 charges, respectively, $F \propto N_1N_2e^2r^{-2}$

For two electrons, the ratio between their electrostatic repulsion and their gravitational attraction is close to 4 2 × 10^{42} Attempts have been made, notably by Eddington, to explain this enormous value, but without much success It is now possible to make a fresh approach along the lines suggested here

Consider two very small bodies r cm apart and each containing 1 gm of matter, and suppose that each body contains N protons (or electrons), a neutron for our present purpose being regarded as equivalent to one proton and one electron Then the electrostatic force in dynes between the protons (or electrons) in the two bodies is N^2e^2/r^2 and the gravitational force between the protons is very close numerically to G/r^2 If the ratio of proton mass to electron mass is α, the gravitational force between the groups of electrons in the two bodies is G/α^2r^2, and the ratio of electrostatic force to gravitational force is $N^2e^2\alpha^2/G = R$, where R is the numerical value of this ratio Thus R/N^2 is a pure numeric, equal to 4 23 × 10^{42} divided by (6 023 × $10^{23})^2$ The result, 1 166 × 10^{-5}, is equal to $e^2\alpha^2/G$ and it is reasonable to inquire if this value can be derived in terms of the fundamental constants e, h and c, where h is Planck's constant and c is the velocity of light *in vacuo* Only one dimensionless combination of these constants is known, namely, $2\pi e^2/hc$, equal very nearly to 1/137, and it is natural to see whether this quantity can be utilized. A possible relationship is $\frac{e^2\alpha^2}{G} = \frac{2}{9}\left(\frac{2\pi e^2}{hc}\right)^2$, since $\frac{e^2\alpha^2}{G}\left(\frac{hc}{2\pi e^2}\right)^2 =$ 0 219 when the experimentally determined values are substituted. Assuming that $\frac{\alpha^2}{G} = \frac{2}{9}\left(\frac{2\pi e}{hc}\right)^2$, it is tempting to split this equation into separate expressions for α^2 and G One possibility is

$$\alpha^2 = \frac{4\pi e(q_0 = 1)}{9hc} \text{ or } \alpha = \frac{2}{3}\sqrt{\left(\frac{\pi e}{hc}\right)}, \text{ numerically, and}$$

G (referred to masses of 1 gm)

$$= \frac{hc\,(q_0 = 1)}{2\pi e} = \frac{hc}{2\pi e}, \text{ numerically}$$

It is necessary to introduce q_0, with the dimensions of charge, into these equations to make them dimensionally correct, and $q_0 = 1$ simply means that q_0 is the charge which when placed 1 cm away from a similar charge causes an electrostatic force of 1 dyne to act between them, the unit of mass being 1 gm If the unit of mass is changed, q_0 and G also change, but α is unaltered Using the best available data for e,

$$h \text{ and } c,\ hc/2\pi e = 6\ 58 \times 10^{-8} \text{ and } \frac{2}{3}\sqrt{\left(\frac{\pi e}{hc}\right)} = 1{,}837\ 4.$$

These results compare with the experimentally determined values 6 67 × 10^{-8} and 1,836 1 The slight disagreement between the calculated and experimentally determined values of G is not surprising, since the assumption that mass is proportional to the number of positive (or negative) charges is not strictly true For hydrogen there are 1 008 mass units for one pair of positive and negative charges, whereas for most of the Periodic Table the ratio is close to 1 mass unit per pair of charges In every atom but hydrogen, mass is used in stabilizing the nucleus, and since the electrical value of the gravitational constant, $hc/2\pi e$, takes no account of this loss of mass, the value 6 58 × 10^{-8} must refer to hydrogen atoms Now the gravitational force between two ordinary bodies r cm apart may be expressed as $F = GN_1N_2/N^2r^2$, where N in this case is the number of protons in 1 gm. of average matter. For hydrogen N is replaced by $N/1.008$, so that $F = (1.008)^2N_1N_2hc/2\pi N^2r^2e$. The normal value of G is therefore equal to $1.008^2 \times 6.58 \times 10^{-8}$, that is, 6.68×10^{-8}, in close agreement with the experimentally determined value.

For two 1-gm. masses of hydrogen r cm. apart, the gravitational force between the electrons is given by $G/(1 + \alpha)^2r^2$ rather than G/α^2r^2, so that the calculated value of α, 1,837.4, should really be equated to $\alpha + 1$. Thus the ratio of proton mass to electron mass becomes 1,836.4, in excellent agreement with the experimental value.

Summarizing, it is possible, apart from minor corrections, to represent the electrostatic force between two charged bodies and also the gravitational force between protons and between electrons by the following equation:

$$F = \frac{n^2N_1N_2e^2}{8kr^2}\left(\frac{hc}{\pi e^2}\right)^{n-1}$$

where n has, respectively, the values 1, 2 and 3 for the three cases in the order given, and k is a dimensionless constant with numerical values as follows:

n	1	2	3
k	1/8	N^2e	N^2

For electrons and protons contained in each case in 1 gm. of matter and placed 1 cm. apart, the gravitational force in dynes is given numerically by

$$F_{e,p} = \frac{3}{4}\left(\frac{hc}{\pi e}\right)^{3/2}$$

Radio-Luminescence in Sodium Chloride and Potassium Chloride

Work on radio-luminescence in rock salt and fluorite and other naturally occurring minerals excited by X-rays and nuclear radiations has been reported by some workers and summarized by Przibram[1]. The present communication deals qualitatively with the production and quenching of luminescence in pure and additively coloured crystals of sodium chloride and potassium chloride, excited by X-rays from a copper target.

A narrow beam of X-rays was allowed to enter a lead box impervious to light through a small circular aperture. The crystal was mounted on a holder with 'Apiezon *Q*', and was centred in such a way that the X-ray beam fell squarely on to the crystal. 'Apiezon' was found to scatter a minimum of X-rays. An E.M.I. 9502 photomultiplier was mounted at right angles to the direction of the X-ray beam, and was made to look on to the crystal through a lead glass window and a shutter. The recording of continuous readings was made possible by such an arrangement, without any interference from the X-ray beam. The micro-ammeter readings at the output of the photomultiplier gave a measure of the luminescence. The photomultiplier was worked with a cathode to first dynode voltage of 160 V. and subsequent interdynode voltage of 80 V.

The crystals were continuously irradiated with 30-keV. X-rays at 10 m.amp., and at various time intervals the luminescence output for different intensities was noted. In Figs. 1 and 2 the luminescence output is plotted against time of exposure for sodium chloride and potassium chloride, at all the intensities used. In both cases the luminescence output is found to rise steeply in the first few minutes and to fall slowly to the saturation value as more and more luminescent centres are destroyed.

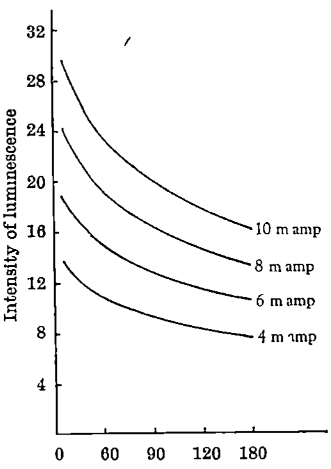

Fig. 1. Results for sodium chloride

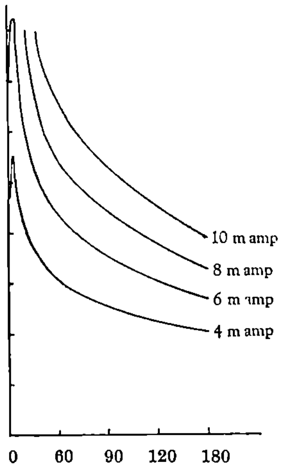

Fig. 2. Results for potassium chloride

The luminescence output is plotted against X-ray intensity at different times of exposure, in Fig. 3 for pure sodium chloride and in Fig. 4 for pure potassium chloride crystal and for the same crystal additively coloured with about 10^{17} F-centres/c.c. These plots bring out the interesting feature of the variation of the slopes of these linear relations with the time of exposure. As the time of exposure increases, the slope decreases, and the curves tend to that due to the additively coloured sample, showing that after high times of exposure a crystal irradiated with X-rays reaches a saturation value, where it behaves like an additively coloured crystal; although it can still lose its trapped electrons by exposure to white light. The intercepts of the y-axis gives the level of phosphorescence introduced into the crystal due to irradiation.

Preliminary results with a number of alkali halides, pure and additively coloured, using the photon-counting technique, showed similar behaviour with sodium chloride and potassium chloride. Potassium

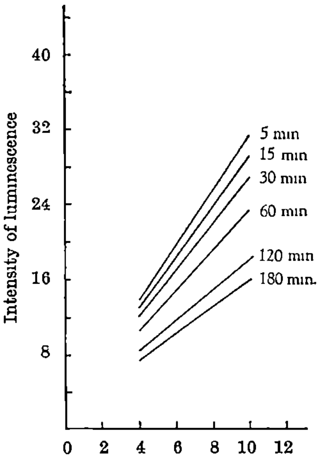

Fig. 3. Results for sodium chloride

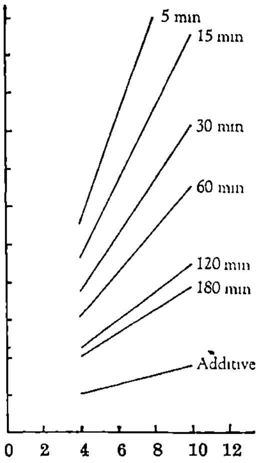

Fig. 4. Results for potassium chloride

iodide showed very fast quenching with virtually no phosphorescence, whereas potassium bromide gave excellent response but long-lasting phosphorescence. The deterioration of luminescence efficiency was almost exponential in potassium chloride and rather slow in sodium chloride, showing that quenching centres are produced in potassium chloride faster than in sodium chloride.

Thanks are due to Dr. K. S. Iyengar for his keen interest and constant encouragement during the course of this investigation and to Mr. R. Thyagarajan for the crystals.

GEOLOGY

Occurrence of Graywacke in the Lower Siwaliks, Simla Hills

We would like to direct the attention of scientists regarding the occurrence of graywacke in the Nahan Series near Kalka, Simla Hills, Panjab, which has remained unnoticed in Indian geology.

During the course of a traverse near Kalka, while studying the terraces of Kaushallia and Jhajjar Rivers, we came across a grey to greenish micaceous 'sandstone' type of rock which in hand specimens appeared to be graywacke. This was confirmed in thin sections of the rocks, which revealed the presence of angular grains of quartz (approximately 50 per cent) embedded in a matrix composed of fragments of slate, schist, quartzite, chert, felspar, chlorite and authigenic sericite. The rock grades imperceptibly into the underlying red clays.

This graywacke is considered to be a part of the lower Siwaliks known as Nahan Series of the area. All the existing text-books on the geology of India state that these deposits are of fresh-water origin. They are considered to be made up of sandstones, grits, conglomerates, clays, and silts having the characters of fluviatile deposits of torrential streams and floods in shallow water basins.

It is interesting to note that as early as 1937, Krynine had referred to the presence of graywacke from the Siwalik formations of north-west India. However, it has failed to direct the attention of the Indian geologists and hence remained out of the present-day Indian geological literature. We would like to state that the present findings were made independently of Krynine's observation.

Although very diverse types of graywacke having variable mineral composition have been described from different parts of the world, it is generally accepted that the graywackes are characteristic of the geotectonic belts. The presence of this rock in the Himalayan foothills is therefore noteworthy as it will throw light on the sedimentation history of the Siwaliks and other adjoining formations at least of this area. It is therefore probable that the notion that the Siwaliks are entirely of fresh-water origin may no longer be true at least in this part of the sub-Himalayan region.

RADIATION CHEMISTRY

Behaviour of Neutron-irradiated Ammonium Sulphate on Thermal Annealing

The behaviour of a neutron-irradiated substance in thermal annealing is known to depend on the temperature and on the period of heating. Normally, the retention reaches a saturation value after a few hours of heating. Very recently, experimental evidence was obtained which indicates that the ammonium group in a compound can influence the course of thermal and radiation annealing[1]. Potassium and ammonium dichromate were irradiated with thermal neutrons under the same conditions and their behaviour in thermal annealing was compared. Retention of potassium salt for various temperatures was as expected, while the retention of ammonium salt passed through a maximum above 170° C. This suggests that a reduction process is taking place at the same time as thermal annealing. Similar results have been obtained for the radiation annealing process.

Experiments with ammonium sulphate were carried out in order to see if this anomaly is also common to other ammonium compounds. The sample of 'Analar' grade ammonium sulphates was irradiated in a polythene tube in the thermal column of the *Bepo* reactor at Harwell for four weeks at a neutron flux of 10^{10} n./cm.^{2}/sec. (pile factor 0.1). The temperature during the irradiation was below 50° C. Together with sulphur-35 formed by the nuclear reaction ^{34}S(n,γ)^{35}S, ^{32}P[^{32}S(n,p)^{32}P] and ^{33}P[^{33}S(n,p)^{33}P] were also produced. Phosphorus-32 and -33 were subjected to separate investigations.

Under the conditions of irradiation used in these experiments sulphur-35 is distributed into several fragments because of recoil. It was found that about 60 per cent of the total sulphur activity was in the form of sulphate, the rest being present as sulphite. It is possible that other fragments of sulphur could be formed as intermediates which, however, are readily transformed into sulphate and sulphite under the conditions of analysis. The samples were dissolved in oxygen-free, boiling, diluted hydrochloric acid together with sulphate and sulphite carrier and phosphate hold-back carrier. Thereby sulphite and other volatile sulphur compounds were immediately separated as gases. These were removed by a stream of nitrogen and absorbed under oxidation in strongly alkaline hydrogen peroxide solution. This part of the sulphur activity as well as the remaining sulphate activity were precipitated as barium sulphate and measured with a suitable end-window Geiger counter. All the necessary corrections have been made.

The thermal annealing of the irradiated ammonium sulphate was carried out in an oven at various temperatures and various heating periods in the presence of air. The heated samples were analysed as stated here. The retention at 100° ± 0.5° C. was plotted against heating time and found to follow a typical annealing process curve. However, at temperatures above 150° C., the curve passed through a maximum. This anomaly was most conspicuous at 180° ± 0.5° C., as shown in Fig. 1. A certain radiation annealing is assumed to occur also during the pile radiation.

It is supposed that free radicals are formed in the target under the influence of the γ-radiation in the pile, probably in a relatively large 'steady-state'

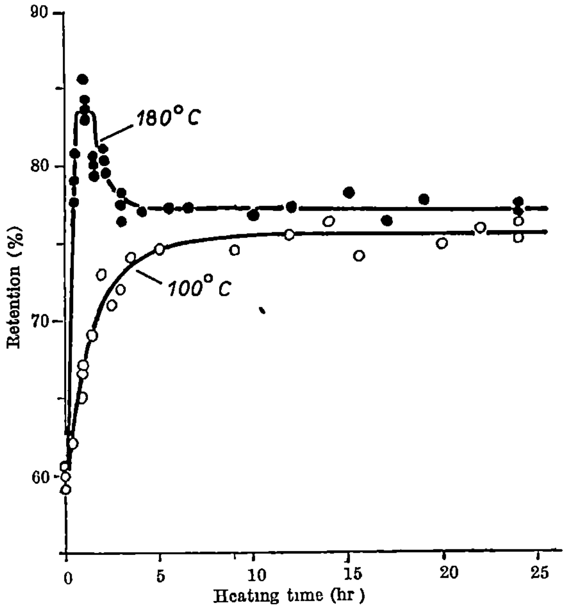

Fig 1 Thermal annealing at 100° and 180° C of ammonium sulphate irradiated in *BEPO*, Harwell, for 4 weeks

concentration, which are available for reaction with the recoil-atoms The ammonium group can be transformed under these conditions into certain fragments, which could give rise to formation of reducing compounds, for example, hydrazine This could either occur during the irradiation in the pile or later in the thermal annealing process All these products formed from the ammonium group can act as reducing agents during the annealing process, although the reducing effect becomes clear only at higher temperatures

The reformed sulphate arises chiefly during the process of thermal annealing directly from the reduced sulphate fragments Another contribution could also be the oxidation of some recoil fragments which form sulphate on dissolving Consequently, two counteracting processes are taking place in the irradiated ammonium sulphate during the period of heating at temperatures greater than 150° C , namely, thermal annealing and reduction

A full report on the role of the ammonium group in thermal annealing will be published in the *Mitteilungen des Instituts fur Radiumforschung in Vienna* (Proceedings of the Austrian Academy of Sciences)

Radiolysis of Liquid Acetone : Effect of Dose-rate and Linear Energy Transfer

The effect of the linear energy transfer parameter of the radiation and of dose-rate on the radiolysis of aqueous solutions can be understood in terms of interactions between spurs along a track and between spurs on adjacent tracks[1] In contrast the radiolysis of organic liquids shows (1) no effect of linear energy transfer on pure alkane liquids[2], although a slight effect has been found with solutions containing iodine[3], and a pronounced effect with aromatic liquids[4] (see also ref 5), (2) effects at much lower values of dose-rate than in the case of aqueous solutions[6].

In the course of a more general study of the radiolysis of liquid acetone I have found that the yields of products are affected both by the linear energy transfer of the radiation and also the dose-rate The *G* value for carbon monoxide production was found to decrease with increasing dose-rate this is somewhat surprising, but may be due to scavenging of radicals by carbon monoxide, for which there is some evidence[7] Since this trend would imply that less methyl radicals are available for reaction at high dose-rates than at low ones, I have normalized the yields of methane, ethane and methyl ethyl ketone (these are thought to be the only products arising from reactions of methyl radicals) to the yield of carbon monoxide and plotted them against dose-rate in Fig 1 The radiation used was γ-rays from a cobalt-60 source and 1-MV electrons from a Van de Graaff machine All runs were carried out at 20° C. and in a dose-rango where it had previously been shown that *G* values were independent of absorbed dose

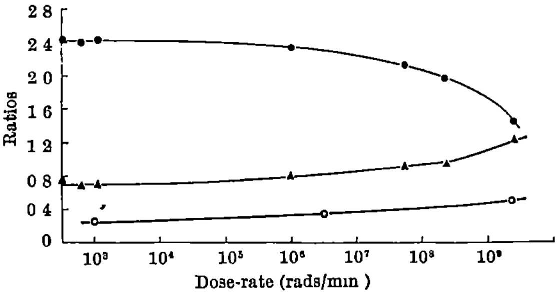

Fig 1 Effect of dose-rate on product ratios ●, CH_4/CO, ▲, $(C_2H_6)^{1/2}/CO$, ○, $CH_3CH_2CO\ CH_3/CO$

It is known that more than three-quarters of the yield of methane in the radiolysis of pure liquid acetone at low dose-rates is derived from the reaction of a thermal methyl radical[8]

$$CH_3 + CH_3\ CO\ CH_3 \longrightarrow CH_4 + CH_2\ COCH_3 \quad (1)$$

and it is probable that ethane and methyl ethyl ketone arise from the reactions

$$CH_3 + CH_3 \longrightarrow C_2H_6 \quad (2)$$

$$CH_3 + CH_2\ CO\ CH_3 \longrightarrow CH_3\ CH_2\ CO\ CH_3 \quad (3)$$

The variation of the product ratios with dose-rate shown in Fig 1 can then be explained in terms of the competing reactions (1), (2) and (3) and the overlapping of 'diffused' spurs at higher dose-rates The dose-rate at which such an effect starts to occur is mainly determined by the efficiency of reaction (1) in removing methyl radicals Since reaction (1) is very slow compared with 'normal' scavenging reactions, the effect on the yields of products occurs at much lower dose-rates than in aqueous solutions[9] Knowing the rate of reaction (1) one can calculate the dose-rate above which combination of methyl (and other) radicals diffusing from spurs on adjacent tracks might be expected to occur This gives the same value (within the limits of the calculation) as that shown in Fig 1 The decrement in CH_4/CO on going from low to high dose-rate (= 0 97) is greater than the increment in $(2C_2H_6 + CH_3\ CO\ CH_2\ CH_3)/CO = (0\ 71)$ this one might anticipate, since we have no experimental measure of the reaction

$$CH_3 + CO\ CH_3 \longrightarrow CH_3\ CO\ CH_3 \qquad (4)$$

which should be more important at higher dose-rates·

Table 1 contains G values of some products as a function of dose-rate (cobalt-60γ and electron irradiations) and of linear energy transfer of the radiation at the same dose-rate (electron and proton irradiations) Comparison of the results of γ- and proton-irradiation illustrates more markedly the effect of dose-rate and linear energy transfer on the products of the radiolysis of acetone, which can be explained as an enhancement of reactions (2) and (3) at the expense of reaction (1), occurring between radicals from spurs on adjacent tracks and between radicals from spurs on the same track It will be noted that G_{CO} appears to be the same for the γ- and proton-irradiations and that G_{CH_3} (total) for γ-irradiation is equal to 2 47 ± 0 18, compared with G_{CH_3} (total) equal to 2 24 ± 0 25 for proton irradiations. the difference, if significant, may again be a measure of reaction (4)

Table 1 PRODUCT YIELDS AS A FUNCTION OF DOSE-RATE AND LINEAR ENERGY TRANSFER

Radiation dose-rate in rads/min	Cobalt-60γ 3 3 × 10^2	1-MV electrons 5 4 × 10^7	2-MV protons 5 4 × 10^7
G_{H_2}	0 44 ± 0 09	0 47 ± 0 10	0 92 ± 0 06
G_{CO}	0 76 ± 0 01	0 47	0 73 ± 0 08
G_{CH_4}	1 85 ± 0 05	0 78	0 59 ± 0 14
$G_{C_2H_6}$	0 25 ± 0 04	0 25 ± 0 04	0 56 ± 0 03
G_{MEK}	0 21 ± 0 01	0 20 ± 0 01	0 53 ± 0 05*

* Dose-rate = 9 6 × 10^9 rads/min

These experiments together with scavenging experiments allow some speculation to be made about the mode of formation of some of the products It has been suggested[8] that ethane is formed in the low dose-rate irradiation entirely from radical–radical reactions in the spur, and this is supported by the present work The suggestion[7,8] that hydrogen formation arises from an abstraction reaction of hot hydrogen atoms appears in conflict with the dependence of the yield on linear energy transfer the latter indicates a hydrogen atom recombination process in the spur Scavenging experiments (with iodine) showed that at low dose-rates at least half and probably appreciably more of the yield of methyl ethyl ketone was unaffected· this product is therefore likely to be formed in radical–radical reactions in spurs also

I thank Dr W Wild for helpful criticism and the United Kingdom Atomic Energy Authority for the award of a fellowship.

CHEMISTRY

Fundamental Relaxation of Classical Oscillators

THE relaxation of systems of gaseous oscillators and the related process of non-equilibrium chemical reaction have recently received detailed consideration However, while satisfactory formal theories have been presented both for the quantum[1–4] and classical[5,6] cases, little progress has been made in formulating the detailed transition probabilities which control the time evolution of these systems, and little can be expected in view of the extraordinarily complex nature of the collision process

The present purpose is to direct attention to an important limiting case in the classical theory Vibrational energy alone is considered and is assumed to be conserved during all collisions If now the precise details of the collisional act are ignored and it is assumed instead that the total energy is redistributed 'statistically' in every collision, then the transition probability distribution (transition kernel) governing the exchange between single harmonic oscillators and a heat bath consisting likewise of single oscillators may easily be shown to be the following.

$$k(E_1,E_2) = (Z/kT)\exp(E_1/kT)\,\mathrm{ei}[\max(E_1,E_2)/kT] \qquad (1)$$

Here Z is the collision number per molecule per unit time, $\max(E_1,E_2)$ is the maximum of a given initial and final energy, kT has the usual significance, T being the heat-bath temperature, and $\mathrm{ei}(x) = \int_x^\infty (1/s)e^{-s}ds$ is the exponential integral ($k(E_1,E_2)dE_2/Z$ is the probability that an oscillator initially with energy E_1 will undergo a transition to dE_2 at E_2 on collision with a heat-bath oscillator)

This result follows immediately on considering the probabilities that (1) an oscillator with energy E_1 will form a collision complex with specified total energy, (2) the complex will divide to leave the oscillator of interest with energy in dE_2 at E_2, all distributions assumed equally probable, then finally integrating over all possible collisions and multiplying by the collision number.

It will be seen that $k(E_1,E_2)$ has a singularity at $k(0,0)$ while from a given energy all down-transitions are equally probable

The relaxation process is described by a time-dependent distribution function $c(E,t)$ which is the solution of the following continuity equation[6]

$$\left(\frac{\partial}{\partial t} + Z\right) c(E,t) = \int_0^\infty k(\xi,E)c(\xi,t)d\xi \qquad (2)$$

Now it is known that the transition kernel (1), with a symmetrizing factor, is essentially the Green's function corresponding to the Laguerre polynomials, and the solution of the above equation with this kernel is in fact

$$c(E,t) = (1/kT)\exp(-E/kT) \left[1 + \sum_{k=1}^{\infty} c_k L_k(E/kT)\exp\left(-\left(\frac{k}{k+1}\right)Zt\right)\right] \qquad (3)$$

where c_k is determined by the initial distribution $c(E,0)$ through the orthogonality property of the polynomials.

$$c_k = \int_0^\infty c(E,0)L_k(E/kT)\,\mathrm{d}E \qquad (4)$$

In the special case where the initial distribution is itself a Boltzmann one, though at a different temperature from the heat bath, it can be shown that

$$c_k = (1-T/T_0)^k \qquad (5)$$

T, T_0 being the temperatures of heat bath and initial distribution respectively

The importance of the transition kernel derived here is that it expresses what, within the scope of the model, is the most efficient possible coupling between heat bath and system

An extended account of the above approach, together with its application to the theory of chemical reaction, is in preparation

I am indebted to the Office of Naval Research, Washington, and the Department of Scientific and Industrial Research, London, for financial assistance at different stages of this work

Thermal Decomposition of Ammonium Perchlorate in Presence of Zinc Oxide

THE decomposition of ammonium perchlorate has been examined by Bircumshaw and Newman[1], and Galwey and Jacobs[2], respectively They have observed that the decomposition of the salt occurs according to two different mechanisms At lower temperature (between 200° and 280° C), when only about 30 per cent of the substance decomposes, the electron transfer mechanism dominates, the energy of activation is 32 kcal , and at higher temperature (between 350° and 400° C) the proton transfer mechanism plays a decisive part (E = 39 5 cal)

Recently, we have investigated the influence of several metal oxides on thermal decomposition of different solids (potassium chlorate, potassium perchlorate, etc)[3] The most effective catalyst for both reactions was nickel oxide, which not only increased the reaction-rate but also lowered the energy of activation of the process According to earlier observations the rate of decomposition of ammonium perchlorate is influenced by metal oxides[4], especially by manganese dioxide In our experiments with ammonium perchlorate from among nickel, zinc, ferric and cadmium oxides it was especially the zinc oxide which was outstanding

As a rule, the experiments were carried out both in air and *in vacuo*, and the reaction-rate was followed by determining the amount of gas evolved The decomposition of ammonium perchlorate between 200° and 300° C , in absence of a catalyst, occurred to the extent of 30 per cent Kinetical results were evaluated by the Prout–Tompkins equation, the unimolecular decay and Avrami–Erofeev's equations respectively. The activation energies calculated from the dependence of rate constants on temperature agree generally fairly well with those calculated by the authors referred to

The decomposition of ammonium perchlorate was effectively catalysed by zinc oxide and then decomposition occurred at 240° C to the extent of 75–85 per cent However, as in our earlier experiments, the rate of reaction decreased in each case with the decrease of the amount of the catalyst[3], now the rate scarcely depended on the amount of zinc oxide, and a considerable catalytic effect was observed even in the presence of about 0 1 per cent of the oxide The contracting-cube formula was found to be the best to evaluate the rate constants in the catalysed decompositions Some data on the energy of activation found at different ammonium perchlorate and zinc oxide mixtures are given in Table 1

Table 1

NH_4ClO_4	ZnO (mole ratio)	Activation energy*
50	1	29 5 kcal
16'	1	33 3 ,,
1	1	33 5 ,,

* Rate constants were calculated from the equation $1-(1-\alpha)^{1/3}=Kt$.

These values are approaching 32 kcal , which corresponds to the electron transfer mechanism, indicating that in the temperature-range investigated the electron mechanism plays a part even in the presence of zinc oxide As is well known, zinc oxide belongs to the n-type group of semiconductors Its electric properties can be effectively influenced by doping with small amounts of foreign ions of different valence Thus we have studied the effect of changes in the electric conductivity of zinc oxide on the catalysed decomposition of ammonium perchlorate According to our measurements the rate of reaction was accelerated by increasing the conductivity of zinc oxide (building-in of 1 per cent of aluminium oxide) and it was lowered by decreasing the conductivity (building-in of 1 per cent of lithium oxide), and it largely lengthened the induction period On the contrary, activation energies practically do not change on doping with zinc oxide

While the catalysed decomposition of ammonium perchlorate could at 240° C be followed easily, above this temperature the course of kinetic curves changed, and already in presence of 0 1 per cent zinc oxide, after an induction period, the substance exploded. The explosion occurred very sharply at mole fraction of 300 1–10 1 ammonium perchlorate–zinc oxide and it was accompanied by a luminous phenomenon In presence of zinc oxide applied in equal mole ratio the decomposition of ammonium perchlorate similarly resulted in an explosion, but not so violently as in the case of mixtures containing a small quantity of zinc oxide By further increasing the concentration of zinc oxide, instead of explosion, degeneration occurred From dependence on temperature of the times until explosion we obtained the energies of activation, given in Table 2, which are practically independent of the amount of zinc oxide between 1 1 and 100 · 1 mole ratio of ammonium perchlorate–zinc oxide mixtures.

Table 2

NH_4ClO_4	ZnO (mole ratio)	Activation energy
100	1	29 5 kcal
50	1	28 0 ,,
25	1	27 0 ,,
10	1	27 6 ,,

According to Galwey and Jacob's measurements[5] the explosion of ammonium perchlorate at 1 atm. pressure occurs only at temperatures above 440° C. From the dependence on temperature of the induction period these authors obtained almost identical value for the activation energy (41 5 kcal) as in the decomposition of ammonium perchlorate at high temperatures from what they stated it appears that the proton transfer mechanism plays a part in the explosion In our experiments the explosion temperature was lowered almost to 200° C by a very small amount of zinc oxide (0 2 per cent) The values of activation energy found by us are considerably lower than those obtained by Galwey and Jacobs and well approach those corresponding to the electron transfer mechanism and determined at a lower temperature

Separation, Identification and Determination of the Fatty Acids of Montan Wax

Crude montan wax is essentially a mixture of the esters of long-chain carboxylic acids, with free acids, resin and asphalt[1]. Much of the work devoted to a study of the wax acids prior to 1930 is clearly unreliable In that year, using micro-distillation and X-ray analysis, Holde and Bleyberg[2] isolated and identified a normal C_{28} acid, and indicated the presence of a normal C_{26} acid Further progress was made by Fuch and Dieberg[3] using absorption and elution chromatography and infra-red spectroscopy They succeeded in isolating and identifying all the normal straight-chain carboxylic acids with even carbon numbers from C_{22} to C_{34}

Using gas-chromatography, we have succeeded in resolving the methyl esters of carboxylic acids from a saponified bleached montan wax A total of 11 components were separated, and identified as the esters of the normal straight-chain acids with both even and odd carbon numbers from C_{22} to C_{32}, inclusive The C_{34} acid identified by Fuch and Dieberg was not detected

This separation was achieved using a 'Shandon' gas-chromatograph and a flame-ionization detector The column originally used was 4 ft in length and contained 100–200 mesh 'Celite' with 10 per cent polyethyleneglycol adipate as stationary phase. More recently the columns have been reduced in length and the packing has included also 1 per cent of orthophosphoric acid[4]

The identifications were made using the well-known relation of the logarithms of retention times with carbon numbers for each homologous series From the work of Fuch and Dieberg, establishing the presence of the normal straight-chain carboxylic acids C_{22} to C_{34}, it should be possible to assign carbon numbers to the retention times recorded, provided that one or preferably two reference retention times are known Such reference times were obtained from stearic and palmitic acids present in a commercial sample of stearic acid From these it was possible to identify not only the C_{22} to C_{32} even-numbered acids noted by Fuch and Dieberg but also the remaining 5 components, as the intervening odd-numbered acids

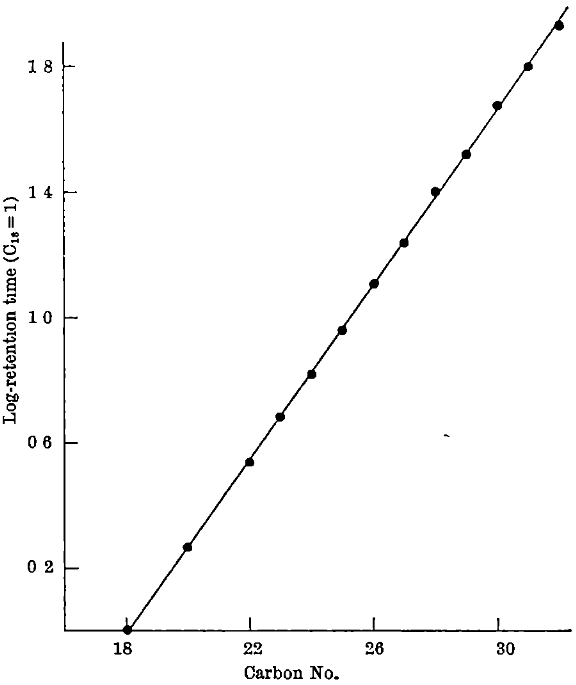

Fig 1 Linear relationship between carbon number and log-retention time

The validity of this identification was confirmed by an examination of arachidic C_{20} and behenic C_{22} methyl esters The linear relation of retention for all the methyl esters recorded is shown in Fig 1 (methyl stearate = 1).

It has been possible to derive an approximate composition of the mixture of esters by measuring the areas below the chromatogram, when the following was obtained

	$C_{16}C_{18}C_{20}$	C_{22}	C_{23}	C_{24}	C_{25}	C_{26}	C_{27}	C_{28}	C_{29}	C_{30}	C_{31}	C_{32}
Per cent	less than 0 05 each	0 25	0 25	7 5	2 0	22 0	3 5	27 5	3 0	24 0	2 0	8 0

BIOCHEMISTRY

Distribution of Potassium in Baker's Yeast

Baker's yeast in the resting state normally contains a relatively large amount of potassium In addition, it has been shown by a number of workers that during active metabolism (aerobic or anaerobic utilization of glucose[1] or aerobic respiration of certain other substrates[2]) considerable net absorption of potassium can occur even though the concentration of potassium in the external medium may be very much less than that inside the cells Accumulation of potassium, and of other cations, by yeast involves active transport of the ions across the cell membrane[3], the inward movement of ions being mediated by relatively specific carrier mechanisms[4] therein Many facts require this interpretation and have been stated in detail elsewhere

The results of an investigation recently carried out in this laboratory[5] showed that the presence of relatively large amounts of bound potassium within the yeast cell is very unlikely In these experiments the total intracellular concentration of free solutes in washed and centrifuged yeast, which had previously been subjected to a repeated process of freezing in liquid oxygen and thawing, was determined by a microcryoscopic method, a mean value, for resting yeast, of 0 59 *M* being obtained This value was in close agreement with that calculated from the known concentrations, determined by chemical analysis, of low-molecular weight substances, including potassium, in the same strain of yeast (0 60 *M*) In dialysis experiments in which the fluid material obtained by alternate freezing in liquid oxygen and thawing of the centrifuged cells was allowed to come to equilibrium with a relatively small volume of distilled water, it was found that the total intracellular concentration calculated from the freezing-point depression of the dialysate was in good agreement with that obtained from direct measurements on the frozen and thawed yeast. From these results it seemed possible that a determination of the proportion of the total potassium in yeast appearing in such dialysates might yield some information about the extent to which this ion is bound in the cells

A series of experiments was carried out in which fresh yeast was twice washed in de-ionized water and centrifuged, the second centrifuging being continued for 20 min at 3,000 r p m The packed cells from this second centrifuging (which were contained in stoppered plastic centrifuge tubes) were then frozen in liquid oxygen and allowed to thaw, this procedure being repeated twice 2-ml samples of the liquid material from the freezing and thawing process were dialysed overnight in the cold against an equal volume of de-ionized water and the potassium content of the dialysate determined This was compared with the total potassium estimated directly on a sample of the frozen and thawed yeast In a group of nine experiments of this kind, the total potassium ranged from 102 5 to 130 0 m equiv /kgm washed and centrifuged yeast, the mean value being 119 0 m equiv /kgm The potassium concentration in the dialysates ranged from 94 0 to 125 0 m equiv /kgm with a mean of 109 0 m equiv /kgm

These results indicated that by far the greater proportion of the total potassium content of yeast is free to diffuse out of the cells once the membrane has been broken by suitable means, and that the amount bound to high-molecular weight cytoplasmic constituents is relatively small This small amount of bound potassium, amounting in the average to about 8 per cent of the total, appears to be quite firmly held In experiments in which the solid residue from the dialysis process was washed in about 50 times its own volume of de-ionized water it was found that, after three such washings, some 50–60 per cent of it still remained bound to the solid cell debris The unlikelihood of relatively large amounts of potassium, previously bound, being released during dialysis is indicated by the close agreement observed[5] between the total intracellular concentration determined from the freezing-point depression of such dialysates and that of the frozen and thawed yeast

Further experiments were concerned with an attempt to determine the distribution between these two fractions of the extra potassium entering the cells during fermentation under a variety of conditions In these experiments the yeast, after fermentation, was twice washed in de-ionized water as before, frozen in liquid oxygen and thawed and the total and 'dialysable' potassium estimated as described above. In each case the results were compared with those obtained from a sample of the same yeast in the resting state These results are summarized in Table 1

From Table 1 it is seen that, with the exception of the long-period fermentation in potassium citrate (sample 4), virtually all the extra potassium accumulated during fermentation appears in the freely dialysable fraction In the case of samples 1 and 2, where the external potassium concentration is relatively low, the results shown in Table 1 would appear to indicate the accumulation of free potassium against a high concentration gradient

Table 1 ACCUMULATION OF POTASSIUM BY YEAST FERMENTED UNDER VARIOUS CONDITIONS

Sample	Total potassium		Potassium accumulated	Potassium in dialysate		Potassium accumulated
	Resting	Fermented		Resting	Fermented	
1	127 5	145 5	18 0	121 0	139 5	18 5
2	118 0	129 0	11 0	114 0	122 5	8 5
3	123 0	150 0	27 0	111 5	137 0	25 5
4	111 0	140 0	29 0	98 0	112 0	14 0

In all cases, 1 part by weight of washed and centrifuged yeast was suspended, with aeration, in 20 vol of fluid containing 5 per cent glucose Other conditions were as follows Sample 1 fermentation for 1 hr in the presence of 10 m moles/litre of potassium chloride plus collidine/hydrochloric acid buffer Final *p*H of suspensions, 4–4 5 Sample 2 conditions as for 1, but with 2 m moles/litre external potassium chloride Sample 3 fermentation for 45 min in the presence of 200 m moles potassium acetate Sample 4 fermentation for 4 hr in potassium citrate (200 m equiv potassium ions/litre)

All values are in m equiv /kgm washed and centrifuged yeast Each sample represents the mean of two experiments with duplicate estimations in each experiment

Table 2 DISTRIBUTION OF SODIUM AND POTASSIUM IN SODIUM-RICH YEAST

Yeast	Potassium (m equiv /kgm) Total	Potassium (m equiv /kgm) In dialysate	Sodium (m equiv /kgm) Total	Sodium (m equiv /kgm) In dialysate
Resting	112 0	97 0	—	—
Sodium-rich	55 0	34 0	80 0	80 0

Results give the mean for three experiments each with duplicate estimations

Conway and Moore[6] have shown that when yeast is fermented in 5 per cent glucose with the addition of sodium citrate, there is a marked accumulation of sodium, potassium being lost. In Table 2 is shown the results of an investigation by the technique outlined here of the distribution of sodium and potassium in a sodium yeast prepared by fermenting fresh yeast for two successive 2-hr periods in 20 volumes of a sodium citrate-glucose medium containing 200 m equiv sodium ions per litre. From Table 2 it appears that virtually all the sodium accumulated is in a freely diffusible form In these experiments there appeared to be some increase in the amount of bound potassium in the cells

Comparison of the Mitochondria of the Small Intestine of Vertebrates

MITOCHONDRIA of the intestinal mucosa of the following vertebrates have been examined by electron microscopy: the rat (*Rattus norvegicus*), guinea pig (*Cavia percellus*), chicken (*Gallus domesticus*), lizard (*Tiliqua rugosa*), toad (*Bufo marinus*) and carp (*Carassius auratus*) (Fig. 1). The mitochondria in the intestinal cells of these species showed no major differences in structure from the other mitochondria that have already been described[1,2]. The intestinal mitochondria from all these species swelled when they were isolated by differential centrifugation in 0·25 *M* sucrose (Fig. 2), but all except those from the rat exhibited considerable succinoxidase activity as measured manometrically (Table 1). The oxygen uptake of homogenates of the intestinal mucosa of rats was also low and variable compared with that of homogenates of intestinal mucosa prepared from guinea pigs. In contrast, the oxygen uptake (per mgm. dry weight) of whole intestinal cells of both the rat and the guinea pig was similar.

Homogenates of the intestinal mucosa of rats were found to inhibit the oxygen uptake of homogenates of the intestinal mucosa of guinea pigs. The inhibitor present in the rat intestinal homogenate was not destroyed by heating for 3 min. in a boiling water bath, or by adding hydrochloric acid to a final concentration of 2 *N*. The inhibitor was not dialysable, but it could be extracted with iso-octane. The iso-octane extract contained a substance that absorbed light strongly at wave-lengths below 250 mμ. This suggested the presence of long-chain unsaturated fatty acids. Chromatographic examination of the extract showed the presence of oleic acid and a smaller amount of linoleic acid. Small quantities of oleic acid (≏ 0·005 ml./mgm. mitochondrial N), or of the material recovered from the iso-octane extract, inhibited by 95 per cent the succinoxidase activity of mitochondria isolated from guinea pigs. The inhibitory effect of oleic acid on a succinoxidase preparation from ox-heart has previously been reported[3]. Nakamura *et al.*[4] also ascribed the low succinoxidase activity of rat intestinal mucosa to the presence of fatty acids. That mitochondria from the intestine of the rat do contain succinic dehydrogenase can be shown cytochemically. When these mitochondria are incubated with 2 : 3 : 5 triphenyl tetrazolium chloride in the presence of succinate, deposits of formazan can be seen. No reduction of the dye occurs in the absence of succinate. As cytochrome oxidase has been shown[5] to donate electrons to triphenyl tetrazolium chloride, it is suggested that the inhibitor of succinoxidase released on the rupture of rat intestinal cells acts between cytochrome oxidase and oxygen. Some evidence to confirm this has been obtained. The cytochrome oxidase activity (measured manometrically) of mitochondria isolated from the intestinal mucosa of the rat is less than one-tenth of that of intestinal mitochondria isolated from the guinea pig.

Table 1. SUCCINOXIDASE ACTIVITY EXPRESSED AS THE $Q_{O_2}N$ OF MITOCHONDRIA ISOLATED FROM THE INTESTINAL MUCOSA OF VARIOUS VERTEBRATES

Animal	$Q_{O_2}N$	Standard error
Rat	< 15	—

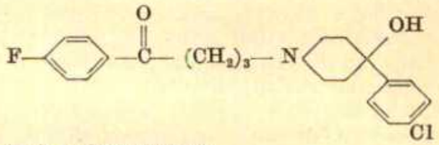
Combustion Analysis of Paper Chromatographic Spots

THE quantitative determination of paper chromatographic spots is usually carried out by using a variety of photometric techniques. In many instances, however, the known methods lack specificity, reliability and sensitivity.



Haloperidol (*R*1625)

For haloperidol[1-3], a new potent neuroleptic agent recently developed in this Laboratory, a satisfactory method of photometric analysis, suitable for the analysis of minute amounts in chromatographic spots, has not yet been found. I have therefore developed an alternative method, based on the quantitative micro-analysis of the organic fluorine content of the spots.

Fluorine (μgm.)			
Actual	Estimated		
0·40	0·25	0·45	0·50
0·80	0·77	0·72	0·60
1·20	1·28	1·14	1·08
1·60	1·68	1·44	1·60
2·00	2·05	2·20	1·70

After one-dimensional chromatographic separation (using methanol, amyl alcohol, benzene, water, 40/20/40/5) on buffered[4] Whatman No. 1 paper, of a solution containing 8–40 μgm. of haloperidol, the haloperidol spots are located by inspection under an ultra-violet light source. The fluorescent area is then cut out and burned in a modified Schöniger oxygen flask[5-8], 150 ml. in volume and with a small valve constructed at the bottom of the flask. The combustion products are absorbed in 3 ml. of water and the inorganic fluoride determined by the colorimetric method of Singer and Armstrong[9]. In a series of 15 experiments, the estimated haloperidol content of the spots varied between 85 and 110 per cent of the actual amounts (8–40 μgm.) which were put on the paper chromatogram.

This general method should be applicable to the quantitative analysis of paper chromatographic and paper electrophoretic spots of compounds containing other halogens, sulphur, phosphorus, arsenic, boron, cadmium, mercury and zinc[10].

Inactivation of *A*-Methopterin by the Acetylating Enzyme System from Pigeon Liver

A-METHOPTERIN (4-amino-N^{10}-methyl pteroyl glutamic acid) inhibits the growth of certain tumours[1] as well as of many folic acid dependent micro-organisms[2]. It is a powerful inhibitor of enzyme systems reducing folic acid to tetrahydrofolic acid[3]. Recent investigations[4,5] have shown that *A*-methopterin inhibits acetylation of aromatic amines. Small quantities of *A*-methopterin have been found to decrease considerably the urinary excretion in mice of the acetylated aromatic amine formed from injected folic acid (unpublished results). Evidence presented here shows that *A*-methopterin is inactivated by the acetylating enzyme system of pigeon liver.

Crude enzyme preparations employed in the present work consisted of 5 per cent extracts of pigeon liver acetone powder in 0·2 *M* sodium fluoride. *A*-methopterin was assayed by the inhibition analysis using *S. faecalis* as the test organism[6]. Initial experiments showed that the assay system was most sensitive in the presence of 0·8 mμgm. of folic acid per ml. The dilutions of the test material were made so that the final concentration of *A*-methopterin in the assay system was 0·5–0·8 mμgm. per ml. Each determination was done in duplicate at 3 different levels of dilution.

* Autoclaved at 10 lb. pressure for 10 min.

Table 2. EFFECT OF *p*-AMINOBENZOIC ACID ON THE INACTIVATION OF *A*-METHOPTERIN

Exp. No.	System	Aliquot (ml.)	Time of incubation (min.)	Growth of *S. faecalis*: Klett units 660 mμ	Growth of *S. faecalis*: Expressed as percentage of control in absence of *A*-methopterin
1	Crude enzyme system	0·4	0	75·0	43·0
	Crude enzyme system	0·4	180	125·0	71·8
2	Crude enzyme system				
	+ PABA (13·2 μgm.)	0·4	0	86·0	49·7
	+ PABA (13·2 μgm.)	0·4	180	107·0	61·5

Incubation system same as in Table 1.

The inactivation of *A*-methopterin in the test system occurred rapidly. Values more consistent with the quantity of added *A*-methopterin were, however, obtained by autoclaving the zero-time samples at 10 lb. for 10 min. prior to assay. The sterilization of the test samples was carried out by filtration through sintered-glass bacteriological filters.

Results given in Table 1 show that incubation of *A*-methopterin for 180 min. with the complete acetylating system from pigeon liver leads to more than 40 per cent decrease in the activity of *A*-methopterin as a growth inhibitor of *S. faecalis*. The fact that the original inhibitory activity of *A*-methopterin is recovered by autoclaving the incubated mixture indicates the formation of a less active or an inactive derivative of *A*-methopterin which is unstable to high temperatures.

The effect of omission of various components of the acetylating system on the inactivation of *A*-methopterin was investigated using pigeon liver extracts prepared according to Chou and Lipmann[7]. In these preparations, fraction *A*-40 activated acetate to form acetyl-coenzyme A and fraction *A*-60 catalysed the transfer of the acetyl group to the acceptor amine.

The results (Table 1) demonstrate that the inhibitory activity of *A*-methopterin is decreased only in the presence of the enzyme system containing all the co-factors (adenosine triphosphate, coenzyme A and acetate) required for the acetylation of aromatic amines. By extensive dialysis, it was possible to demonstrate the requirement for acetate. The inactivation of *A*-methopterin did not occur in absence of any one of the active protein fractions. This excludes the possibility of inactivation due to non-specific adsorption on proteins *p*-Aminobenzoic acid (PABA), which can be acetylated by the pigeon liver enzyme system and so may be expected to compete with the acetylation of other amines, was consistently found to diminish the inactivation of *A*-methopterin (Table 2) The quantity of extra PABA added in these experiments did not affect the growth in the control system These observations, and the fact that the *A*-methopterin molecule contains the necessary structural features, suggest that the inactivation of *A*-methopterin is brought about through the formation of acetyl derivatives which are less active or completely inactive as inhibitors for the growth of *S faecalis* Aminopterin is also inactivated by a similar enzyme system, but to a lesser extent than *A*-methopterin Earlier work of Jacobson[8] on the effect of aminopterin on cell division have indicated the formation of an inactive derivative from aminopterin on incubation with various animal tissues, including leukæmic cells Fountain *et al* [9] have reported that the concentration of *A*-methopterin detected in liver and kidney of mice injected with *A*-methopterin increased several fold when the samples were boiled before assay Since both these organs contain the acetylating enzymes, the increased activity produced on boiling the tissue could have resulted from breakdown of acetyl derivatives of the type which the present work has shown to be unstable to high temperatures

A-methopterin was found to inhibit the acetylation of sulphanilamide in pigeon liver preparations but had no effect on acetyl-CoA formation Similar results have been obtained also by Johnson *et al* [4]. Apparently *A*-methopterin inhibits the acetylation of aromatic amines by interference with the transferase component of the overall system The removal of acetyl groups for the acetylation of *A*-methopterin as inferred from the present findings could explain the type of inhibition produced by *A*-methopterin on biological acetylations

Improved Benzidine Sugar Reagent for Paper Chromatograms

BENZIDINE has been found to be a useful reagent for sugar detection on paper chromatograms[1,3] and for quantitative determination in test-tubes[4] Horrocks[3] first found that benzidine–acetic acid detected reducing aldoses on paper chromatograms, but ketoses were detected only at high concentration Bacon and Edelman[1] added trichloracetic acid to the benzidine–acetic acid reagent to increase its acid strength and claimed that it detected less than one microgram of glucose in free or combined form Its sensitivity to fructose was considerably less An acid is required for the formation of furfuraldehyde from sugars Furfuraldehyde, or a degradation product of it, then reacts with an aromatic amine or phenol (benzidine in this case) to form a coloured product It is important that the acid should be strong enough to cause the reaction to proceed, but, in the case of paper chromatography, it should not cause partial destruction of the paper or produce a dark background colour For this purpose, organic acids (acetic, phthalic, or trichloracetic acid) have been used However, when mineral acids at low concentrations are used, an improved reagent is obtained without paper destruction or serious background interference

In an attempt to improve this reagent, it was discovered that addition of mineral acids to the benzidine–trichloracetic–acetic acid reagent caused precipitation, but this difficulty was overcome by the application of the components separately to the paper The use of mineral acids with the benzidine reagent permits the detection of aldoses and ketoses in free or combined form in 1-mgm quantities Through the manipulation of the procedures to be described below, classes of simple sugars and monomers of oligosaccharides can be distinguished on one chromatogram Procedure *a* is relatively specific for aldoses, and procedure *b* for ketoses If both aldoses and ketoses are to be revealed in one chromatogram, procedure *c* or *d* should be used

The benzidine reagent is prepared by dilution of 10 ml. of stock 1 (5 0 gm. benzidine in 100 ml glacial acetic acid) plus 10 ml of stock 2 (40 0 gm trichloracetic acid in 100 ml distilled water) to 100 ml with 95 per cent ethanol[1] The stock solutions keep indefinitely in brown bottles The mineral acids are 0 3 *N* hydrochloric acid in 95 per cent ethanol and 1 *N* phosphoric acid in 95 per cent ethanol.

Procedure *a* Spray a chromatogram with the benzidine reagent and heat at 70° C for 10–15 min Aldoses of 1 mgm quantity in free or combined form are revealed as brown spots against a white background Ketoses are detected only at high concentration

Procedure *b* Spray a chromatogram with the benzidine reagent Follow this with a light spraying of 0 3 *N* hydrochloric acid in 95 per cent ethanol, and then heat at 70° C for 10–15 min Ketoses of 1 mgm. quantity in free or combined form are revealed as yellow spots against a pale background Aldoses at high concentration give faint brown spots The yellow colour intensity is enhanced under ultra-violet light

Procedure *c* It is essentially the same as procedure *b*, except that hydrochloric acid is replaced by 1 *N* phosphoric acid in 95 per cent ethanol Both aldoses and ketoses in free or combined form are revealed in their characteristic colours on a chromatogram which appears moist and has a light background

Procedure *d* Spray a chromatogram with the benzidine reagent and heat at 70° C for 10–15 min for the detection of aldoses, spray lightly with 0 3 *N* hydrochloric acid in 95 per cent ethanol and heat again at 70° C for 10–15 min to detect ketoses This procedure is better than procedure *c* because of its high sensitivity and relative specificity for classes of sugars By this procedure both aldoses and ketoses in either free or combined form are revealed as brown and yellow spots respectively against a light background Stachyose, raffinose, cellobiose, melibiose, sucrose, maltose, lactose, rhamnose galactose, glucose, fructose, mannose, arabinose, xylose and ribose give their characteristic colours, brown for aldoses, yellow for ketoses, and the colour of the oligosaccharides containing aldoses and ketoses depends on the sugar concentration and heating temperature

By the addition of mineral acids at low concentration the benzidine reagent[1,3] is improved to detect simple sugars and oligosaccharides with high sensitivity and relative specificity

Crystallization of the Complex of D-Amino-Acid Oxidase and 'Substrate-Substitute'

In an earlier communication[1], it was reported that a crystal was obtained from the mixture of D-amino-acid oxidase apo-protein, flavin-adenine-dinucleotide and benzoate, a 'substrate-substitute'. It was also found that the crystal is composed of equimoles of the apo-protein, coenzyme and benzoate By adding D-alanine to the solution of the crystal, the complete decolorization of the coenzyme accompanied by the liberation of the benzoate was observed This result indicated that the benzoate can be replaced by the substrate, and that the enzyme is not denatured when crystallized by combining with benzoate In the present experiment, we sought to find another 'substrate-substitute' to crystallize this enzyme

Among the benzoic acid derivatives, *p*-nitrobenzoic acid was also considered to be a 'substrate-substitute' from our former experiment[2] *p*-Nitrobenzoic acid was expected to be detected more easily by its absorption peak at 275 mμ than benzoate Using *p*-nitrobenzoic acid as 'substrate-substitute', a crystal was obtained from the mixture of the apo-protein, flavin-adenine-dinucleotide and 'substrate-substitute' in the same way as reported in the previous report[1]. The solution of the crystal retains its full activity after heating at 60° C for 3 min , indicating that the apo-protein is considerably stabilized in the crystal The shape of the crystal is nearly the same as that of the crystal obtained from the mixture of the apo-protein, coenzyme and benzoate. The crystals were collected by filtration, and the filter cake was washed twice by distilled water The crystals thus obtained were dissolved in pyrophosphate buffer (*M*/60, *p*H 8 3)

The absorption spectrum of the crystal in the visual wave-length region is shown by curve I in Fig 1 It exhibits the same characteristic feature as in the case of the crystal of the apo-protein-coenzyme-benzoate complex the peaks appeared at 380 mμ and 465 mμ, a marked shoulder being recorded at 485 mμ

To liberate the combined coenzyme and the 'substrate-substitute' from the apo-protein, the *p*H of the solution of the crystal was adjusted to *p*H 5 0 and heated at 90° C for 3 min The completely denatured protein was removed by centrifugation After the *p*H of the supernatant was corrected to 8·3, its absorption spectrum was measured as shown by curve II in Fig 1 The spectrum was considered to be the sum of the spectra of two compounds, the coenzyme and *p*-nitrobenzoic acid The spectrum, however, is identical with that of flavin-adenine-dinucleotide in the range from 370 mμ to the longer wave-length, and *p*-nitrobenzoic acid has no absorption in this region. So the theoretical spectrum of the coenzyme (curve III) was calculated from the optical density at 450 mμ of curve II Consequently, the absorption spectrum of *p*-nitrobenzoic acid in the supernatant can be calculated to be curve IV, which has the same shape with that of the standard *p*-nitrobenzoic acid (curve V) Comparing the optical density at 275 mμ of curve IV with that of curve V, the molar concentration of *p*-nitrobenzoic acid as compared with those of the apo-protein and coenzyme in the crystal was calculated as follows 1 2 moles of *p*-nitrobenzoic acid, 1 1 moles of the apo-protein, and 1 0 mole of flavin-adenine-dinucleotide.

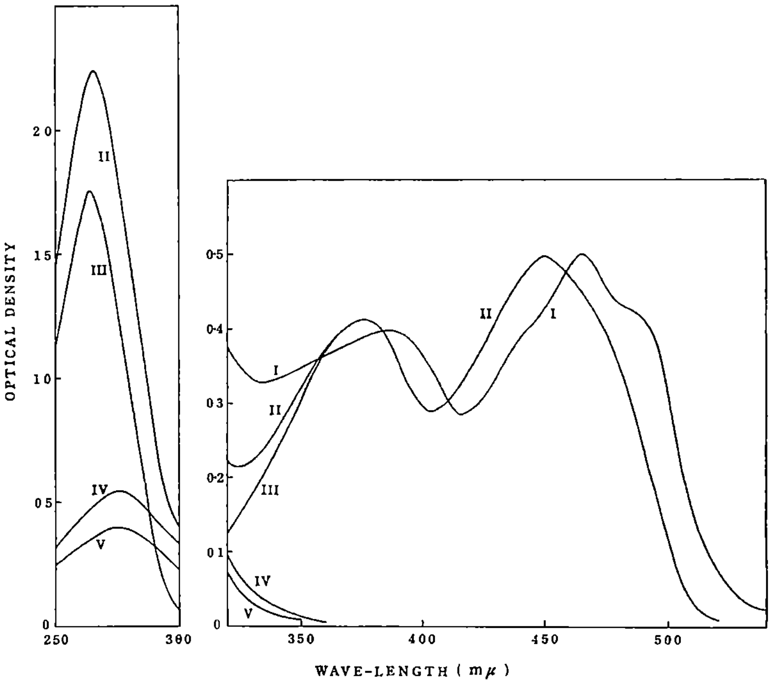

Fig 1 Absorption spectra of the crystal and *p*-nitrobenzoic acid in pyrophosphate buffer (*M*/60, *p*H 8 3). I, The crystal, II, the supernatant obtained after heating I to denature the apo-protein (see text), III, flavin-adenine-dinucleotide calculated from the optical density of II at 450 mμ, IV, theoretical spectrum of II–III, V, *p*-nitrobenzoic acid (4 0 × 10^{-5} *M*)

From these results, it was concluded that D-amino acid oxidase apo-protein can also be crystallized by combining with equimoles of *p*-nitrobenzoic acid and coenzyme in the same way as in the case of benzoate. This fact may be attributed to the low specificity of this enzyme

Furthermore, it seems clear that the enzyme can be easily crystallized by combining with a suitable compound as 'substrate-substitute' which can combine with the protein at the same binding sites as the substrate, but not be oxidized by the enzyme The crystal of the complex of the enzyme and such a 'substrate-substitute' may provide a valuable clue in elucidating the actual features of enzyme-substrate compounds

PHYSIOLOGY

Persistence of Sterols other than Cholesterol in Chicken Tissues

Recent work by Davison and his collaborators[1-3] has shown that cholesterol may be incorporated in the nervous tissues of myelinating chickens and rabbits and that this cholesterol will persist in these tissues for considerable lengths of time Our interests in the metabolism of cholesterol and other sterols prompted us to compare the distributions in chicken tissues of injected sitosterol and lanosterol with that of cholesterol Emulsions of cholesterol-7-^{3}H (purchased from New England Nuclear Co , Boston, Mass), sitosterol^{3}-H (randomly labelled, gift of Dr Leon Swell), and lanosterol-^{3}H (randomly labelled, gift of Dr George J Alexander) in saline were prepared by the method used for preparation of cholesterol-^{14}C emulsions for experiments involving mitochondrial oxidation of this sterol[4] Newly hatched White Leghorn chicks were used and the appropriate sterol emulsion (0 50 ml) was injected directly into the yolk sac After four days, radioactivity could be detected in the brain tissue of chickens from each group After 9 weeks the one surviving chicken in each group was killed by exsanguination. The blood was collected in centrifuge tubes and the erythrocytes separated. All the brain, cord, liver, spleen and aorta was excised, weighed and dissolved in strong potassium hydroxide The non-saponifiable fraction was assayed for tritium radioactivity in a liquid scintillation counter Small pieces of sciatic nerve were taken from each chicken and all showed slight but consistently detectable radioactivity Other findings are shown in Table 1

It is of interest that all three sterols were incorporated into brain tissue The rather large incorporation into erythrocytes is also noteworthy as is the small but persistent incorporation of radioactivity into the aortic tissue. That a small percentage of orally ingested cholesterol will be deposited in the aorta of adult rabbit[5] or man[6] has been shown The relative persistence of lanosterol-^{3}H in the liver could indicate greatly reduced turnover as compared with the other two sterols In view of reports that some insects and mammals may convert sitosterol and ergosterol to cholesterol or cholesterol-like compounds[7-10], it was necessary to prove the presence of the injected material Gas chromatography of the non-saponifiable fractions from the brains and livers of all three chickens showed the presence of only the injected sterol and cholesterol (We are greatly indebted to Dr. W M Holmes of Smith, Kline and French Laboratories, Philadelphia, for these analyses)

Table 1 Recoveries of Tritium Radioactivity from Non-saponifiable Fractions of Chick Tissues Nine Weeks after Injection of Certain Sterols

	Recovery (per cent)		
Sterol	Cholesterol-^{3}H	Sitosterol-^{3}H	Lanosterol-^{3}H
Input (c p m)	4 3 × 10^{5}	8 2 × 10^{4}	8 7 × 10^{5}
Brain	0 60	0 76	0 28
Cord	Lost	N D *	0 02
Erythrocytes	0 33	0 24	0 49
Liver	0 40	0 25	1 07
Spleen	0 14	N D *	0 35
Aorta	0 02	0 18	0 13

* N D , not detectable

Work with larger groups of chickens is in progress Preliminary results are consistent with those presented here Experiments involving more accurate characterization of the labelled sterols as well as autoradiography of specific tissues are under way

Effect of Sheep Pituitary Extract on Hypercholesterolæmia in Intact and Hypophysectomized Rats

The prolonged administration of cortisone or adrenocorticotrophic hormone (ACTH) has sometimes been found to cause a change in the concentration of cholesterol in serum in human beings and in experimental animals While some workers[1,4] report that they have found such an elevation, others have noted no effect[7]; still others have reported the opposite[8]

A study of endocrine factors influencing the cholesterol[8] content of serum has shown that, although a mild increase in the concentration of serum cholesterol occurred in rats from daily subcutaneous injection of 2·5 mgm. of cortisone acetate for two weeks, there was no significant change from corticotropin[5] in a dose of 0 3 mgm (about 20 i u.) suspended in peanut oil and given subcutaneously over the same period of time However, in hypophysectomized rats there was an increase of 80 per cent or more in the cholesterol content of serum on treatment with 0 5 mgm of cortisone acetate daily for a period of 4 days or with daily injection of 0 3 mgm corticotropin in oil for two weeks The effect of corticotropin was mediated through the adrenals as there was no such elevation in adrenalectomized hypophysectomized animals.

The increased sensitivity of the hypophysectomized rat, over the normal animal, to the development of hypercholesterolæmia from cortisone or corticotropin was found to be much greater in the case of hypercholesterolæmia induced by feeding 5 per cent cholesterol and 0 1 per cent sodium cholate in 'Purina' fox chow diet for periods of from four days to three weeks A crude pituitary extract was found to lower the concentration of cholesterol under these circumstances

Acetone-dried sheep pituitary powder was extracted by stirring with distilled water and adjusting the pH to 10 with 2 5 N sodium hydroxide, after centrifugation the extract was lyophilized The dry material easily dissolved in saline at a concentration of 100 mgm per ml The animals were injected subcutaneously with a daily dose of 40 mgm over the period of cortisone treatment, or over the last four days of feeding a high-cholesterol diet Forty mgm of this extract was given to hypophysectomized rats twice daily for four days On the fifth day body weight and the weight of thyroid, adrenals, testes, seminal vesicles and ventral prostate were noted It was found that the extract was rich in gonadotropins and, in addition, contained small amounts of growth hormone, thyrotropin and corticotropin

None of the purified or semi-purified fractions of pituitary gland tested inhibited cortisone-induced or dietary hypercholesterolæmia completely The fractions tested were growth hormone of Raben *et al* [5,6] in a dose of 0 3–3 0 mgm daily, an extract prepared by the method of Koenig and King[2] in a daily dose of 2–6 mgm , Armour thyrotropin ('Thytropar'), 0 2 unit daily, Armour lactogenic hormone ('Panlitar'), 2–4 mgm daily, Schering pregnant mare serum gonadotropin ('Anteron'), 20 I U daily, desiccated thyroid, 0 006–0 01 per cent in diet, and testosterone propionate, 2 5 mgm twice weekly Œstrogen increased somewhat the serum cholesterol in the rat Animals given posterior pituitary powder in a dose of 5 mgm daily all died by the third day The extract of Koenig and King and desiccated thyroid had only a moderate effect alone or in combination However, the effect of these compounds was more pronounced when given in higher doses There was also a moderate effect noticed with testosterone and when bovine liver extract, prepared in a similar way and administered in the same dosage as the pituitary extract, was given (Table 1)

Table 1 EFFECT OF DIFFERENT HORMONES ON THE SERUM CHOLESTEROL CONTENT OF INTACT AND HYPOPHYSECTOMIZED RATS
For details of dosage and period of treatment, see text

	Normal (mgm per cent)	Hypophysectomized (mgm per cent)
Control	85 (117)*	73 (193)
ACTH	89 (8)	134 (10)

Antagonism of Reserpine by Intraventricular Bretylium

BRETYLIUM, as shown by Boura and Green[1], causes an inhibition of sympathetic nervous transmission by a blocking action at adrenergic postganglionic neurons Reserpine also inhibits peripheral sympathetic nervous transmission but does so by depleting adrenergic nerve endings of the transmitter substance norepinephrine[2] It also causes a depression of central nervous activity (tranquillization or sedation) which is associated with depletion of brain stores of norepinephrine[3] and 5-hydroxytryptamine[4]. It seemed of interest to see if bretylium could block the actions of reserpine on the central nervous system In order to study interactions of the two drugs on the central nervous system both had to be given so that effective concentrations of each could be attained at this site. Investigations by Boura *et al* [5] in which labelled bretylium, which is a quaternary amine, was administered to cats, demonstrated that only small quantities reached the central nervous system In order to attain a higher concentration the bretylium in the present work was administered intraventricularly

Male albino mice of *CF*–1 strain were used Bretylium tosylate, 4 mgm /kgm dissolved in normal saline, was given subcutaneously or in a single intraventricular injection of 0 03–0 05 ml following the method described by Haley and McCormick[6] Control intraventricular injections of equal volumes of normal saline were also made Reserpine phosphate, 2 5 mgm /kgm , was injected subcutaneously 0 5 hr after the intraventricular injection The mice were kept in individual jars The following tests were begun on the mice 0 5 hr after the reserpine injection (1) *spontaneous activity* as each jar cover was removed the mouse was scored 100 (moving body), 50 (moving head), or 0 (no movement), (2) *evoked*

Table 1 EFFECT OF INTRAVENTRICULAR BRETYLIUM ON RESERPINE IN MICE

Treatment No 1 (intraventricular)	Treatment No 2 (subcutaneous)	No of mice	Time tested after treatment No 2 ½ hr	1 hr	2 hr	3 hr	4 hr
			Blepharospasm (complete closure = 100)				
Bretylium	—	5	0	20	0	0	0
Saline	—	17	0	0	0	0	0
—	Reserpine	15	0	6	30	52	67
Bretylium	Reserpine	15	0	7	12	13	23
Saline	Reserpine	20	0	6	30	44	56
—	Reserpine plus bretylium	5	0	0	0	53	80
			Plasticity (complete immobility = 100)				
Bretylium	—	5	100	90	90	20	0
Saline	—	17	0	47	29	24	8
—	Reserpine	15	0	30	30	73	90
Bretylium	Reserpine	15	75	90	60	47	60
Saline	Reserpine	20	95	63	70	68	80
—	Reserpine plus bretylium	5	40	20	30	80	100
			Evoked activity (normal mouse = 100)				
Bretylium	—	5	60	80	100	100	100
Saline	—	17	86	88	91	94	92
—	Reserpine	15	90	90	63	37	17
Bretylium	Reserpine	15	40	40	47	57	53
Saline	Reserpine	20	87	83	40	33	25
—	Reserpine plus bretylium	5	90	100	90	50	0
			Spontaneous activity (normal mouse during first ½ hr = 100)				
Bretylium	—	5	50	0	20	60	80
Saline	—	17	93	41	29	32	38
—	Reserpine	15	95	57	50	30	10
Bretylium	Reserpine	15	0	0	23	33	30
Saline	Reserpine	20	17	10	5	10	0
—	Reserpine plus bretylium	5	100	80	60	70	40

activity the mouse was picked up by the tail and scored 100 (marked sideways movement or arching of body), 50 (slight movements of body), or 0 (no movement), (3) *blepharospasm* while held by the tail the degree of opening of the palpebral fissure was scored 100 (complete closure), 67 (almost closed), 33 (slightly narrowed), or 0 (wide open), (4) *plasticity* the mouse was replaced in the jar in a semi-standing position with its forefeet resting on the vertical sides of the jar and the degree of plasticity or immobility in this unusual position was scored 100 (retains unusual position for more than 15 sec), 50 (retains unusual position for 5–15 sec), or 0 (gets back on all four feet in less than 5 sec) The scores resulting from each series of mice are given in Table 1

The most marked effect observed was the block by intraventricular bretylium of the reserpine induced blepharospasm. Four hours after reserpine all mice without intraventricular bretylium had marked or complete blepharospasm (scores 67 or 100) while those with bretylium ranged from no closure to marked blepharospasm Subcutaneous bretylium was not effective in counteracting this action of reserpine

The intraventricular injections of saline or bretylium produced some plasticity, as defined above, in the responses of the mice This was more marked with bretylium, but disappeared over the 4-hr test period Reserpine had a slow onset, gradually producing plasticity, and this appeared to be inhibited by intraventricular bretylium

At 4-hr , evoked activity of reserpine-treated mice was depressed Subcutaneous bretylium and reserpine also blocked evoked activity Intraventricular bretylium did not depress evoked activity of the mice and tended to counteract the depression caused by reserpine

Spontaneous activity was the most variable parameter tested Mice receiving reserpine without bretylium showed somewhat less activity at 4 hr than those receiving intraventricular bretylium in addition to reserpine

The interpretation which we would give to the above results is that bretylium is capable of antagonizing the central effects of reserpine if it is injected so that it reaches the same sites of action as reserpine This correlates with the interaction of bretylium and reserpine peripherally reported recently by Costa[7], who has shown that when the two drugs are administered together the ability of reserpine to deplete cardiac stores of norepinephrine is markedly reduced.

Effect of Aldosterone on the Living Cornea *in vitro*

EARLIER work has shown that the cornea of the rabbit, excised and mounted between two chambers, can be kept alive and functioning for 8 hr [1] during which time it can be demonstrated that the epithelium generates an electrical potential of 20–50 mV [1], that sodium is actively transported across the epithelium into the corneal stroma[2], and that the net flux of sodium is equivalent to virtually all the neutralizing current[2,3] This system appeared to afford a satisfactory model for the *in vitro* study of the effect on sodium transport of aldosterone, the principal sodium-retaining steroid of the adrenal cortex of most mammals studied[4] Aldosterone is assumed to affect sodium exchange in the renal tubule[5], and has been demonstrated *in vitro* to stimulate transport of sodium across the isolated bladder of a toad[6] and skin of a frog[7] In the present investigation the effect of aldosterone on the excised cornea of the rabbit was assessed *in vitro*

The cornea was excised and mounted in a lucite clamp between two chambers, each containing a facsimile of rabbit aqueous humour[1] (The composition of this fluid was the same as that used in the earlier work[1,2] except that 2 0 instead of 1 0 ml of glucose 12 per cent were added Ascorbic acid (20 mgm per cent) was added in several experiments, also[8]) The pressure within the chamber was adjusted to approximate normal intraocular pressure, 20 cm of water Thirty experiments were carried out with measurements of potential difference, electrical resistance, and neutralizing current being made at 20-min intervals The preparation was allowed to stabilize over a 2-hr period. Measurements were then made over an additional hour to establish a base-line for readings during the experimental period At the end of the hour, *d*-aldosterone (kindly provided by Dr Robert Gaunt of CIBA, Inc) was added to the bathing medium, in 15 instances to the epithelial side, and in 15 to the endothelial side The *d*-aldosterone was dissolved in distilled water The steroid was added to the preparation in such quantities as to arrive at a final concentration in the ambient fluid of 1–1,000 μgm /100 ml, that is, in concentrations ranging from 10^2 to 10^5 times those encountered under physiological conditions Such high concentrations are effective in enhancing sodium balance *in vivo*[9] and sodium transport *in vitro*[7] In two experiments, cortisol, dissolved in small quantities (0 1–1 0 per cent, final concentration) of ethanol, was added in addition to aldosterone, in order to assay a possible 'permissive' effect of cortisol on aldosterone action, as shown in the whole organism[9]

In order to provide for optimal diffusion and tissue binding of the steroid, 2–3 hr. were allowed to pass In two instances, tritiated aldosterone was added to the bathing fluid in order to determine the permeability of the cornea to steroid At the end of a 5-hr period, fluid was removed from both sides of the cornea, carrier aldosterone was added, the fluid specimens were extracted with ethyl acetate, and the extracts were washed, dried, and chromatographed in the Bush *B*5 system (benzene methanol water)[10], the steroids being localized by reaction with blue tetrazolium and eluates counted in a liquid scintillation counter

Table 1 PERCENTAGE CHANGE IN ELECTRICAL INDICES OF RABBIT CORNEA *in vitro* DURING THE ADDITION OF *d*-ALDOSTERONE*

Exp No	Experimental conditions	Electrical indices		
	Compound added to fluid bathing epithelium	% Δ *I*	% Δ *PD*	% Δ *R*
	(per cent)			
1	20 μgm aldosterone	0	+ 4	+ 9
2	1 μgm aldosterone	− 2	+10	+14
3	10 μgm aldosterone	− 4	− 6	− 9
4	20 μgm aldosterone	+28	+58	+18
5	10 μgm aldosterone	+ 3	+ 8	+ 8
6	10 μgm aldosterone	+ 8	+10	+ 1
	Compounds added to fluid bathing endothelium			
	(per cent)			
7	10 μgm aldosterone 20 mgm sodium ascorbate	+ 2	+ 9	+ 6
8	10 μgm aldosterone	− 5	+ 6	+ 5
9	10 μgm aldosterone 20 mgm sodium ascorbate	−14	+ 7	+26
10	10 μgm aldosterone 1 mgm cortisol	− 4	+ 7	+10
11	10 μgm aldosterone 1 mgm cortisol	+ 1	− 4	− 5
12	100 μgm aldosterone 10 mgm cortisol	+11	+14	+20
13	Control—nothing added	−14	+ 6	+21

* These figures represent percentage changes in current (*I*), potential difference (*PD*) and resistance (*R*) from a time one half-hour before the addition of aldosterone to a time 2 hr after addition of the hormone There is no large or consistent change in neutralizing current (sodium flux) Experience has shown that the small increases in *PD* and *R* cannot be interpreted as indicating anything more than the viability of the preparations

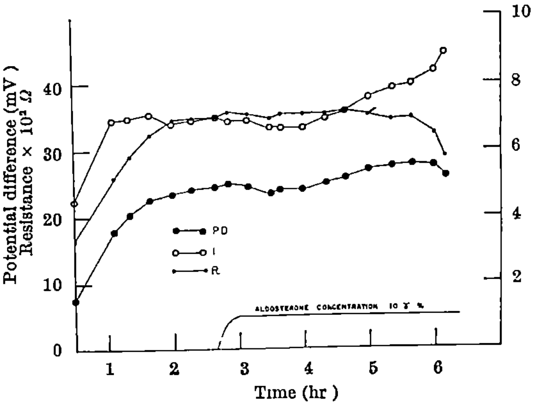

Fig 1 Results of experiment 6 No significant changes in electrical indices can be found in response to the addition of aldosterone to the bathing media The changes at the far right of the graph indicate the end of the useful life of the preparations

The results of 13 representative experiments are summarized in Table 1, and one of these experiments (No 6) is illustrated in Fig 1 It will be noted that the addition of *d*-aldosterone over a wide range of concentrations elicited no significant change in any parameter of electrical activity, that is, addition of the steroid did not enhance the active transport of sodium Further, addition of cortisol was without effect Aldosterone was shown to pass through the cornea, the concentration on the opposite side being about 1/100 that on the side to which the steroid was originally added

The results do not agree with those of Crabbé[6] or of Penney *et al* [7] They are, however, in harmony with those of Maetz *et al* [11], who failed to demonstrate an enhancement by aldosterone of active sodium transport in the skin of a frog *in vitro*, but showed such an enhancement in the isolated skin of frogs which had been pre-treated with the steroid A possible explanation for the lack of *in vitro* effect of aldosterone in this preparation is that more than 6 hr may be required for such an effect to become manifest However, it is not possible to keep the rabbit cornea alive and functioning effectively much in excess of 6 hr An alternative hypothesis is that sodium transport in this multi-layered, avascular membrane occurs in large part independently of hormonal control There is no *a priori* reason for supposing that aldosterone acts ubiquitously on cellular membranes

HÆMATOLOGY

Use of Phenol in the Isolation of Erythropoietic Glycoprotein

THE erythropoietic activity in the plasma of rabbits made anæmic with phenylhydrazine can be isolated as an acid glycoprotein. A dialysed and lyophilized ethanol fraction from heat-coagulated plasma consistently gives us a potent stable highly water-soluble preparation. Six laboratories have found good correlation in a comparative assay of a batch prepared by us[1]. Further di-ethyl-amino-ethyl cellulose column fractionation removes 40–50 per cent of inert protein and results in the active glycoprotein previously described[2].

While the active peak could be re-chromatographed on di-ethyl-amino-ethyl cellulose without apparent change in electrophoretic and elution properties, there was usually a drop of 25–75 per cent in specific activity. Even more striking losses occurred in the fractionation of erythropoietin from human urines. Urine from patients with congenital hypoplastic anæmia was precipitated with 4 volumes of ethanol. The non-dialysable portion of the precipitate, a mixture consisting in the main of glycoproteins, contained essentially all the erythropoietic activity of the original urine. It could be further resolved on di-ethyl-amino-ethyl cellulose but with variable, sometimes complete, loss of activity.

One ethanol precipitate from human urine, after removal of the dialysable part, had this activity in a fasted rat assay[1]: 1 mgm. total dose per rat gave 26.8 per cent ^{59}Fe-uptake in the blood. When 100 mgm. portions of the precipitate were fractionated on di-ethyl-amino-ethyl cellulose we repeatedly lost 90–100 per cent of the activity although all the protein was recovered in successive eluates with 0.01 to 1.0 *M* sodium chloride.

We had observed before that plasma erythropoietin is not damaged by phenol and is extractable into a phenol upper layer like some other glycoproteins in the procedures of Morgan and Partridge[3], Westphal *et al.*[4] and Kirby[5]. By using as little as 0.1 per cent phenol in all equilibration and elution buffers in di-ethyl-amino-ethyl cellulose chromatography, as well as on both sides of the membrane during dialysis, we are now consistently recovering more than 50 per cent of the activity contained in the original urine.

The dialysed and lyophilized ethanol fraction from plasma, fractionated as previously described on di-ethyl-amino-ethyl cellulose[2], but in the presence of phenol, yields a peak with 2–3 times the specific activity of the original fraction, corresponding with the removal of inert material.

Evidence to date indicates that erythropoietic activity requires integrity of a glycoprotein since proteolytic enzymes as well as neuraminidase inactivate. Erythropoietin could be a glycoprotein associated with inert glycoprotein or even some other compound which becomes labile on disintegration of carrier glycoprotein. Enzymes like those mentioned, or other as yet undefined carbohydrases, either secreted with the urine or coming from other sources, could be responsible for large losses of urinary activity. The presence of phenol during isolation may prevent subtle changes through bacteriostasis, enzyme inactivation, anti-oxidant action, etc.

If it were not for measurement of the biological activity the protective effect of phenol would not have been noted. We hope that this preliminary report might be useful to those working with glycoproteins with or without biological activities.

This work was supported by a grant of the American Cancer Society.

Thalassæmia in Melanesia

THALASSÆMIA has previously been regarded as non-existent in Melanesians[1]. In August 1960, a Papuan female from the Milne Bay area of New Guinea, aged 18–20 yr., was admitted to the General Hospital, Port Moresby, for re-investigation of a refractory anæmia first noticed during pregnancy in 1957. On that occasion she had been delivered of a full-term, apparently normal, infant, her hæmoglobin-level having been maintained by transfusions. Since discharge she had received no treatment and had been able to carry on normal village life, in spite of a hæmoglobin-level remaining fairly constant at 5–6 gm. per cent. Investigation in August 1960 showed typical bony changes, a hypochromic microcytic anæmia with target cells and normoblasts present in the peripheral blood, and the alkali denaturation test[2] showed 67 per cent undenatured hæmoglobin. The presence of hæmoglobin *F* as a major component was confirmed by hæmoglobin electrophoresis on cellulose acetate strips. Since then three other cases of thalassæmia major in Papuan children have been diagnosed, two of the children aged 5 yr. and 1.5 yr. came from the Kerema district, and one aged 3 yr. from the Oro Bay area in Papua.

All showed typical bony changes on radiological examination, a hypochromic microcytic anæmia with normoblasts and target cells in the peripheral blood and excess hæmoglobin *F*—32 per cent, 39 per cent and 46 per cent—by alkali denaturation, confirmed by hæmoglobin electrophoresis. All had been treated by transfusion on many occasions. In two of them diagnosis was delayed, presumably in one because of suppression of endogenous erythropoiesis by transfusion[3], and in the other by the presence of an aplastic crisis[4]. One of the children from Kerema has undergone splenectomy and his transfusion requirements have been greatly diminished since operation. Glucose-6-phosphate dehydrogenase estimation in this child on two occasions showed 46 and 56 units/100 ml. red blood cells respectively, suggesting that he has the negroid type of glucose-6-phosphate dehydrogenase deficiency in addition to thalassæmia.

In view of the fact that these cases have come from widely separated districts, it is considered that thalassæmia may be widespread in New Guinea.

Thanks are due to Dr. P. Brain of the Red Cross Transfusion Service, Perth, who carried out the hæmoglobin electrophoreses, Dr. D. Curnow and

Dr W Pitney, of the Royal Perth Hospital, Perth, who performed the alkali denaturation tests and examined the peripheral blood and marrow smears, and Prof J B Chatterjea of the School of Tropical Medicine, Calcutta, who confirmed the presence of hæmoglobin *F* in two of the cases, being the first to demonstrate it in one case Mr Ian Parsons, of the Peter MacCallum Institute, Melbourne, carried out the estimations of glucose-6-phosphate dehydrogenase

HISTOLOGY

Antidiuretic Hormone and Renal Collecting Tubules

GINETZINSKY[1] has reported that, in the kidneys of rats treated with posterior pituitary extract, the epithelium of the collecting tubules becomes flattened and its basement membrane less distinct We have attempted to repeat Ginetzinsky's observations

Fifty-two young male white rats, 150–200 gm in weight, were fasted overnight with free access to water and then treated in one of four ways

(1) Eighteen rats were given water by stomach tube (5 per cent of body-weight followed by 3 per cent after 1 hr , or 7 per cent of body-weight with replacement of lost water every $\frac{1}{2}$ hr) and were killed during a diuresis of 2 0–3 5 ml (11 rats) or 1 0–2 0 ml (7 rats) per $\frac{1}{4}$ hr

(2) Sixteen rats were treated similarly, but the water diuresis was inhibited by a subcutaneous injection of 'Pitressin' (Parke Davis), 25–30 m units per 100 gm body-weight These rats were killed when urine flow, which was rapidly inhibited, had fallen to 0 3 ml /15 min or less, in 4 rats the flow had ceased completely for a half-hour or more

(3) Nine rats were given the hormone but no water, and (4) nine were given neither water nor hormone but killed after being handled similarly to the other groups In groups (3) and (4) the output of urine did not exceed 0 3 ml in any single 15-min period

The following methods were used for staining sections of kidneys of these rats (*a*) Bharadwaj and Love's method for mitochondria[2], (*b*) LaCour, Chayen and Gahan's method for lipids[3], fixation in Zenker's fluid, followed by (*c*) hæmatoxylin and eosin, (*d*) Heidenhain's azan, (*e*) toluidine blue or (*f*) the periodic acid–Schiff reaction (PAS), (*g*) fixation in formol saline, followed by Heidenhain's iron hæmatoxylin In each group, Bharadwaj and Love's method, the PAS reaction and either azan or hæmatoxylin and eosin were each used for at least half the rats and the other methods for two animals of the group

The staining of mitochondria and lipids showed differences between rats and between tubules in individual kidneys These variations are reported elsewhere[9]

From the examination of sections stained by the PAS reaction, by toluidine blue, by azan, and by Heidenhain's iron hæmatoxylin, the following generalizations can be made

(1) In all rats the collecting ducts were lined by cuboidal epithelium, which became low columnar in form near the tip of the pyramid The height of the epithelium of these ducts did not differ perceptibly from one rat to another or between groups of rats, if similar distances from the tips of the pyramids were taken in choosing fields for comparison

(2) The collecting ducts converge early in their course, so that sections parallel with the plane of the pelvis and ureter must be central if the ducts are to be seen in the pelvic half of the pyramid Besides these ducts, the only tubular organs in the innermost medulla are blood vessels and thin segments of Henle's loops Thus it is possible to obtain longitudinal sections of the pelvic half of the medulla which show only tubules lined by low cells, such as those in Ginetzinsky's Fig 4, but it does not follow that some of these must be collecting ducts, which in this region are to be found only in the centre of the pyramid

(3) The basement membranes varied in appearance between sections of the same block when toluidine blue was used, but, after the PAS reaction, these membranes were clearly seen, constant in appearance for each part of the nephron, and did not vary appreciably between the experimental groups

(4) The PAS reaction showed the collecting ducts to differ between individual kidneys in the proportion of intercellular boundaries which showed stained cement In the ducts of some kidneys PAS-positive material was present in the lumina in masses up to 50μ in diameter These two features were not obviously correlated with each other, nor did either provide a point of distinction between experimental groups

These findings do not support the suggestion that hyaluronidase, which Ginetzinsky[1,6] reported to be secreted in increased concentration in the urine under the influence of antidiuretic hormone, acts by altering the visible form of basement membranes and intercellular cement in the collecting ducts Since such variability in tubular mucopolysaccharides as was found in our experiments could not be correlated with the treatment of the rats, our results may be compared with those of Berlyne[4,5], who, estimating hyaluronidase in the presence of a constant concentration of electrolytes[7], reported that the rate of excretion of hyaluronidase in the urine was unrelated to the rate of urine flow We did not obtain any evidence for the apocrine activity which, according to Ginetzinsky[1], is indicated by a loss in height of the epithelium of the collecting ducts

The findings reported here agree with those of Heller and Lojda[8], who examined renal histology under the influence of water and antidiuretic hormone but did not record rates of urine flow

PATHOLOGY

Acetylcholine in Sweat in Fibrocystic Disease of the Pancreas

THE varied secretory abnormalities in fibrocystic disease of the pancreas in which elevated sweat electrolytes and deficient pancreatic enzymes are linked to viscid mucus glycoproteins and increased parotid secretory rate suggest an underlying mechanism of overstimulation of exocrine glands with cholinergic innervation[1-4]. Roberts[5] further hypothesizes that excessive exocrine gland stimulation might result should acetylcholine (ACH), released at secretory nerve endings, persist owing to defective enzymic breakdown by cholinesterase, or, alternatively, to excessive quantities released. It seemed to us that a stimulating neurohumor not completely inactivated at its site of release might be found in the secretion of the gland it stimulates. Thus we examined sweat, a secretion abnormal in fibrocystic disease, for evidence of any characteristic neurohumoral activity. We have found in thermal sweat well-defined levels of a free choline-ester indistinguishable from acetylcholine. The activity was detected in sweat samples from normal individuals as well, but appeared to be of a significantly higher order in the fibrocystic.

Patient subjects were twenty-nine children in hospital at the National Institutes of Health, sixteen with and thirteen without fibrocystic disease of the pancreas. Their average age was eight years. Each was sweated thermally for 1 hr. in a plastic bag under blankets by a modification of Schwachman's method[6], in which collections were made from a restricted area

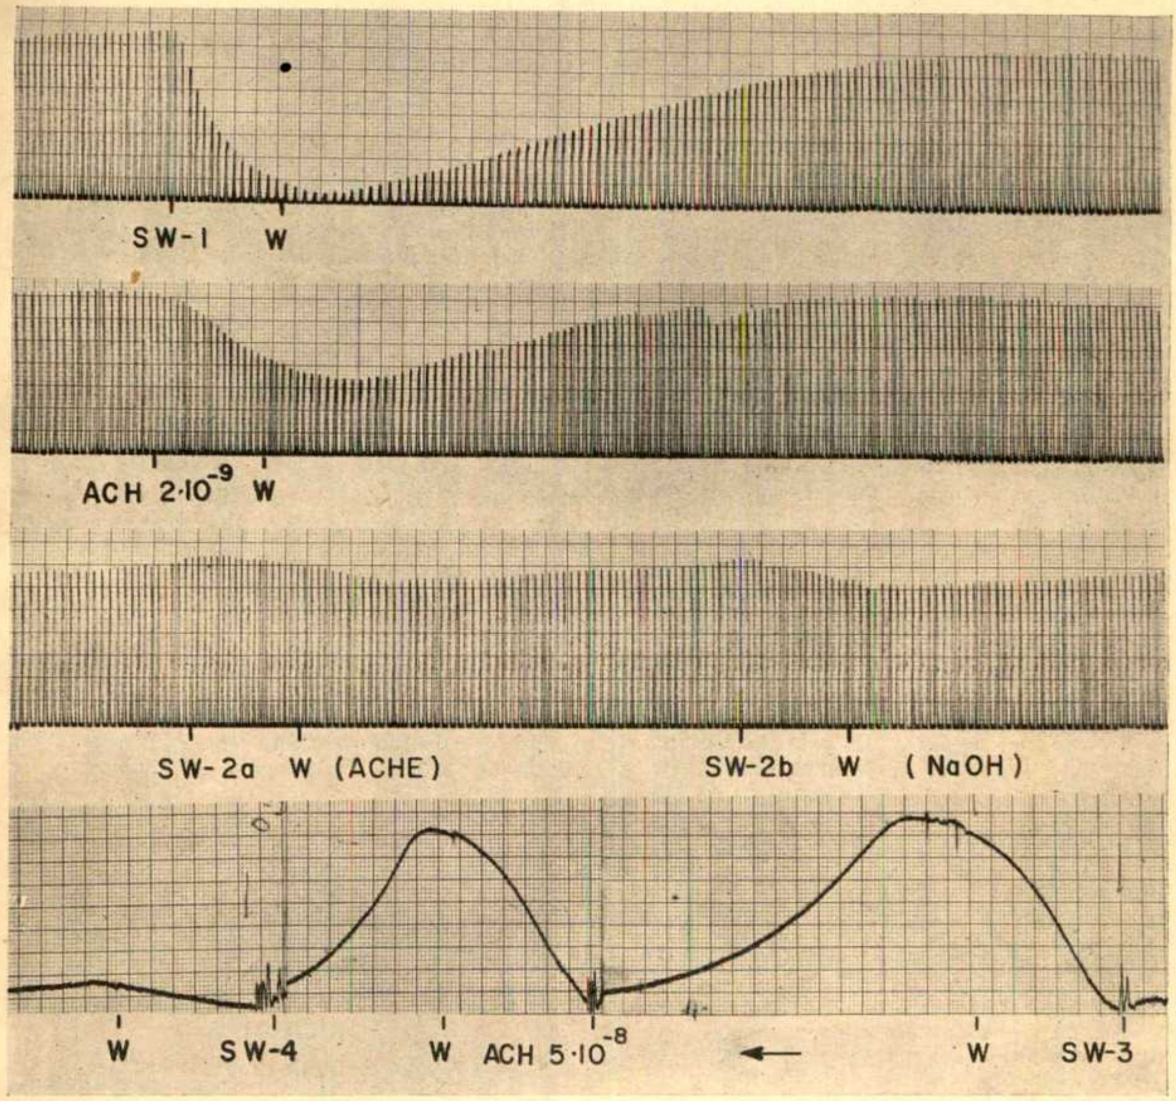

Fig. 1. Bioassay (*Venus* heart and frog rectus) of sweat from fibrocystic patient (lowest tracing reads right to left). *SW*-1, 0·4 ml. of sweat inhibiting *Venus* heart 95 per cent, giving estimated ACH content of 0·1 μgm./ml. of sample; *W*, wash, at 1·5 min. with *Venus* heart, 2 min. with frog rectus assay; ACH 2×10^{-9}, acetylcholine chloride, final concentration in bath of solution containing 0·02 μgm./ml. giving 50 per cent inhibition of heart; *SW*-2*a*–*SW*-2*b*, 0·4 ml. vol. of sweat inactivated by acetylcholinesterase (*SW*-2*a*) and sodium hydroxide (*SW*-2*b*); *SW*-3, 1·0 ml. of sweat giving 43 mm. contraction of frog rectus muscle, equivalent, after correction for interfering activity to ACH content of 0·15 μgm./ml. (several constituents of sweat affect the frog rectus contraction—we have found the highly specific *Venus*-heart assay gives a more accurate ACH level)—0·5 ml. of sweat gave a 17-mm. contraction, not shown); ACH 5×10^{-8}, acetylcholine chloride, final concentration in bath of solution containing 0·25 μgm./ml., giving 38 mm. contraction of muscle; *SW*-4, 0·55 ml. of sweat inactivated for ACH with acetylcholinesterase treatment; 4 mm. contraction from non-inactivated substances remains

of the back and simultaneously from the rest of the body surface. Sweat obtained by another method[7] and for shorter time-periods gave similar results. Measurement was made of sweat volume, pH, sodium and potassium. Samples were acidified to pH 4·0 with 1 N hydrochloric acid and assayed immediately or frozen to preserve activity. Sweat was tested in volumes of 1 ml. or less for choline-ester activity by bioassay on the heart of *Venus mercenaria* according to Welsh's method[8] and occasionally, when feasible, on the eserinized frog rectus muscle[9].

Two inactivation procedures used on each sample distinguished choline-ester activity from that of choline and inorganic ions. Activity was abolished by boiling for 15 min., at pH 12·0, after addition of sodium hydroxide but preserved after boiling at acid pH 4·0 (ref. 9). In the second procedure the activity was destroyed on incubation for 1 hr. with 0·5 mgm. of commercially purified bovine erythrocyte cholinesterase (ACHE) in buffer at pH 6·8. pH measurements were made with a glass electrode.

Fig. 1 shows an example of the activity found in sweat from a representative fibrocystic patient. The average choline-ester activity for the sixteen fibrocystic patients expressed as acetylcholine was 0·075 μgm./ml. of sweat (range 0·01–0·25 μgm./ml.). The corresponding figure for the thirteen control patients was 0·0065 μgm./ml. (range 0·002–0·02 μgm./ml.). Five fibrocystic patients gave very high values averaging 0·19 μgm./ml. Some scatter appears in the data from the disease group. Also overlap occurs between groups as one fibrocystic failed to give levels higher than 0·01 μgm./ml. while two non-fibrocystics presented levels of 0·015 and 0·020 μgm./ml. Levels tended to be constant on retesting the same individual and did not appear to be related to sweat volume or pH.

Our work has not been extended to adults or to infants, nor is it controlled for variable degrees of acclimatization or for the finer physiological parameters of sweat collection. The relationship of the findings to function of sweat glands therefore remains to be clarified. Two previous reports describe acetylcholine in sweat from normal individuals in levels estimated at 0·001–0·002 μgm./ml. (ref. 10). The presence of this neurohumor in remarkably higher amounts in the sweat of fibrocystic patients is being investigated.

Types of Cell in Ascites Tumours

THE mouse tumour *MCIM* (Klein) exists in two sub-lines, the M_{SS}, which only grows in the solid form, and the M_{AA}, which grows as an ascites tumour and also in solid form, designated M_{AS}. The difference between the behaviour of the sub-lines is as yet unexplained in terms of cell structure. Bergstrand and Ringertz have recently found no constant difference on examination with the electron microscope[1]. These tumours have been investigated recently by means of the aniline-blue staining technique[2].

It has been found that solid tissue cells, including those of solid tumours, show a blue rim- or surface-staining which is believed to be associated with staining of the common part of the cell walls of adjacent cells which lie between the electron-dense cell membranes. In the M_{SS} tumour such staining is seen in fresh preparations and in sections. The fresh ascites cells of the M_{AA} tumour, like all ascites tumour cells examined, fail to stain at all with the aniline-blue reagent, and stand out as clear, refractile spheres in the blue solution. However, there are also present in the fluid, and sometimes loosely adherent to the peritoneum, small compact masses of cells which, when washed to remove loosely attached free cells, are firm in consistency and show a blue staining surface which may be thick and irregular.

When fresh preparations of the M_{AS} tumour are so treated, it is found that both types of cell are present but in different proportions. There is, in young tumours, a preponderance of solid tumour masses which show blue-staining surfaces, with isolated pools of 'free' cells which can readily be washed out from the tissue and which fail to stain. It appears, therefore, that tumours of either type derived from the $_{AA}$ sub-line contain both elements, the predominating form depending on the environment. This accounts for the appearance of apparently typical 'ascites' cells in the M_{AS} tumours examined by Bergstrand and Ringertz. The softening found in the centre of older M_{SS} tumours is probably due to the cell degeneration so commonly found; in the M_{AS} tumours there may, in addition, be a predominance of 'free' cells in such areas.

Whether the two forms of cell breed true or whether the surface changes are reversible is not yet clear. Further investigations into this and into the reason for the failure of the free ascites cells to stain with aniline-blue are in progress.

BIOLOGY

Feeding Habit of Some Central African Freshwater Fishes

FISHES of the family Citharinidae, belonging to the genera *Phago* Steind., *Eugnathichthys* Blgr. and *Belonophago* Gilt. (Figs. 1–2), together forming part of the sub-family Ichthyoborinae, have an extremely specialized and curious feeding-habit, being, namely, fin-eaters.

This most interesting fact was discovered during an ichthyological survey of Lake Tumba and the Central Congo Basin by our Institute in 1959 Amongst other biological observations, the examination of all gut contents was particularly stressed, and a large number of specimens belonging to these genera were found to have fin fragments in their stomachs All species belonging to these genera apparently are exclusively fin-eating, at least in the adult stage (Only *Phago loricatus* Gunth , from the Niger, has not been examined) Other genera, like *Gavialocharax* Pell and *Paraphago* Blgr , judging from their morphology (dentition), probably also belong to this interesting little group, while *Phagoborus* Myers , though ichthyophagous, also has been found to eat fins occasionally

Several authors, amongst others G Marlier[3], had already noticed that most fishes in the Central Congo rivers had mutilated fins, often even severely torn and cut up This condition was thought to be caused by some carnivorous species of leech, insect or fish, but was mostly ascribed to bacteria or some type of fin rot, and at first we put forward the hypothesis that it was done by a large predaceous Dytiscid beetle (*Cybister* sp), which often attacks (small) fish Mr J P Gosse, of the I N E A C , had also recently noticed this strange fin-eating habit in some of these species of fish, thus further confirming our observations

Morphologically, these fish are very specialized and possess a powerful dentition, well adapted to their method of feeding They are very elongate species, *Belonophago* even needle-like in form *Phago* and *Belonophago* are very slender, possessing large, extremely hard scales, often strongly ridged, their jaws are long, narrow and beak-like *Eugnathichthys* has numerous small soft ctenoid scales and shorter, broad and strong jaws The first two genera are small, respectively reaching a size of 16 and 12 cm , whereas *Eugnathichtys* can grow to 30 cm

The mouth is large, the jaws elongate, closing tightly on one another, the premaxillary is mobile

The teeth are cuspidate (bicuspid, usually), in two parallel rows, those in the outer one much larger, strong, sharp and firmly inserted on the external border of the jaw, forming a saw-like ridge This last character is particularly apparent in *Eugnathichthys*, the dentition of which reminds one of that of South American Piranhas (*Serrasalmus*)

The intestine is very short, nearly straight, being coiled back only once on itself, with numerous pyloric cæca, the stomach is large and muscular In spite of the bony nature of the material ingested, digestion seems to be fairly rapid, to judge from the fact that many specimens had empty stomachs The stomach contents are composed exclusively of diverse fin fragments and some scales, the intestine containing only hard concretions, largely of a calcareous nature The young (of less than 30–40 mm standard length), feed mostly on aquatic insect larvæ (*Ephemerida*, *Trichoptera*)

Observations effected in a large aquarium containing a specimen of *Belonophago hutsebauti* Gilt and several other fish species (*Distichodus*, *Chrysichthys* spp) revealed some interesting aspects of its mode of feeding The fish 'hovered' in horizontal position just below some floating grass, the fins (especially the pectorals) vibrating As soon as some other fish swam within reach, it darted out, grabbed hold of a fin between its long jaws and snipped off part with a quick twist, the startled victim unconsciously favouring this action by also twisting and pulling away minus a piece of fin

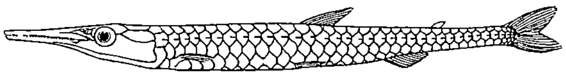

Fig 1 *Belonophago tinanti* Poll (× 2/9) (ref 10)

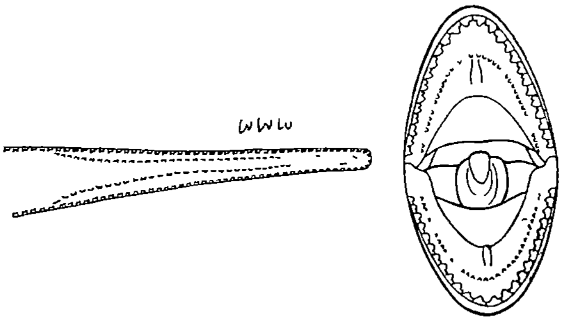

(a) (b)

Fig 2 (a) *B tinanti*, upper jaw, showing dentition (ref 10) (b) *E eetveldi*, mouth, showing dentition (ref 10)

The species belonging to the genera mentioned often go about in small groups in lakes and large rivers, close along the shores, and preferably in relatively calm zones where vegetation (bushes, grass) trails in the water, or near the expanses of floating grass (*Echinochloa* and *Panicum*) which clog up the river arms and coves The species attacked usually are slow-moving herbivores like *Distichodus*, *Tylochromis*, or bottom-feeders like *Chrysichthys*, though more vigorous swimmers like *Alestes*, *Lates* and even *Hydrocyon* often also show lacerated fins The dorsal, anal and caudal fins are those commonly bitten off, paired fins rarely showing mutilations Moreover, according to the native fishermen, they appear to attack man on some occasions

A similar feeding habit has been suspected for the Nyassa cichlid fish *Docimodus johnstoni* Blgr , the strong jaws and cutting teeth of which are figured by Boulenger[2] Of this it is written[1] "This fish is well named Chiluma—'the thing that bites' Stomach contents suggest that the cutting teeth may be used to bite pieces from the fins of other fishes" Trewavas states (personal communication) that of eleven stomachs examined six were empty, four contained fragments of fins and one a little plant and insect débris Among marine fishes the Blenniidae *Runula*[4] and *Aspidontus*[5] are described as parasites, biting bits off fins and skin of other fishes, *Aspidontus* approaching its victim by means of a mimetic resemblance to a 'cleaner-fish' An allied habit is that of scale-eating, practised not only by certain Cichlidae of lakes Tanganyika[8,9] and Nyasa[2,6,11] but also by a Panamanian characid, *Roeboides occidentalis*[3]

Considered economically, these fishes are a nuisance in the sense that the wounds inflicted not only pave the way for various diseases (especially bacterial and fungal), like fin rot, but often contribute to make the victim an easy prey for predators, some having their fins nearly entirely amputated, thus considerably hampering their locomotion and balance

Fin-eating fish are very common in some places, for example, in Lake Tumba, where many species show serious fin mutilations Unfortunately, there exists no effective method actually of reducing their numbers, as they are hard to catch with conventional fishing gear Small-meshed gill-nets, however, placed perpendicularly to the shore in appropriate zones, often catch quite a number, but have the disadvantage of also catching the young of many economic species, at least in certain seasons

This curious mode of feeding almost certainly evolved from the voracious habits of their ancestors, this being supported by the fact that related genera, like *Mesoborus* Pell and *Phagoborus*, for example, are distinctly ichthyophagous, the latter even partly fin-eating occasionally, whereas all members of the sub-family Ichthyoborinae are predominantly carnivorous

Mediterranean Fishes of the Family Istiophoridae

Scombroid fishes belonging to the family Istiophoridae are rather uncommon in the Mediterranean However, a species has been known for a long time and was actually discovered there It is *Tetrapturus belone*, described by Rafinesque[1] from Sicily, where it is captured chiefly during the summer months, later, it was found in other localities, for example, Spain, Genoa, Naples, Malta and the Adriatic

A second Istiophorid was described by Canestrini[2] after a specimen was caught in the bay of Genoa This was given the name *Tetrapturus lessonae*, which was synonymized by subsequent authors with *T herschelii* Gray or with *T georgii* Lowe The type of *T lessonae* is now preserved in the Museum of Natural History in Genoa; another similar specimen was also caught long ago in the Bay of Genoa and still exists in the Zoological Museum of Turin[3] Both these fishes are adult and are easily recognizable as *Makaira albida* (Poey) Such identity was suggested by La Monte[4] and is fully confirmed by careful study of all their characters, during a recent visit to Florida I became familiar with *M albida* This species is well known in the Atlantic, including its eastern part, where it has been recently observed[5] It certainly exists in the Mediterranean too, but it seems to be of very rare occurrence in this Sea, maybe it does not reproduce there It is probable, however, that some records of *T belone* really belong to *M albida* We do not know at present whether the *Tetrapturus* living in the Atlantic (for example, Florida) are the same species as those of the Mediterranean It would appear unlikely that such widespread pelagic fishes as Istiophorids should include a species restricted to the Mediterranean As new investigations on these huge fishes are carried out, it becomes more and more evident how far we still are from adequate knowledge of them *T belone* and *M albida* are very similar, both morphologically and biologically, and I do not feel certain that they deserve to be generically separated (rather than included in *Makaira* Lac 1803, which has priority over *Tetrapturus* Raf, 1810) I would entirely reject their placing in different families, Istiophoridae (*Tetrapturus, Istiophorus*) and Makairidae (*Makaira*), which is the procedure adopted by Bertin and Arambourg[6]

Ben Tuvia[7] reported a young *Istiophorus gladius* (Brouss) from Haifa (Israel) and supposed it to be an immigrant from the Red Sea through the Suez Canal I know no other Mediterranean records of this easily identifiable genus It is to be looked for chiefly in the southern parts of this Sea, not only eastward, but also in the western section, where the occasional occurrence of the Atlantic form (*I americanus* Cuv Val), that exists along the coasts of Africa and Europe, is quite possible *Makaira albida* is to be expected in the whole western basin of the Mediterranean An expert student of Istiophorids, Col J K Howard (Marine Laboratory, University of Miami), recently told me that this fish is sometimes caught off Ceuta and La Linea

In conclusion, the Mediterranean fauna certainly includes at least three species of Istiophoridae *Tetrapturus* (or perhaps *Makaira* ?) *belone* Raf (the commonest, known for a long time in the Mediterranean only), *Makaira albida* (Poey) (Atlantic, recorded from the Bay of Genoa), *Istiophorus gladius* (Brouss) (Indo-West Pacific, recorded from Haifa)

As stated above, further researches are needed With the co-operation of some ichthyologists from the United States, we hope to improve the knowledge of the Mediterranean Istiophorids and to reach a better understanding of their relationships with the species living in the Atlantic

Development of the Polychaete *Fabricia sabella* (Ehr)

A striking feature of the rock shores of the southern coast of Northumberland is the presence of extensive silt patches which lie on top of the rock platforms in the intertidal area These patches are occupied characteristically by dense populations of the sabellid worm, *Fabricia sabella* (Ehr)

While engaged on an ecological study of this annelid the opportunity was taken to investigate its breeding Rasmussen has been quoted by Thorson[1] to have expressed the opinion that the reproduction of this species is non-pelagic A study of the Northumberland population has shown that not only is the development non-pelagic but also that the entire larval development takes place within the tube of the adult female

When the tubes of adult females collected in May were dissected open the presence was observed of small batches of eggs and larvæ in various stages of development situated in small dilations of the tube, each batch being covered with a mucus envelope Up to ten batches could be found in a single tube with 1–7 individuals in each batch The batches were distributed along the length of the tube from the

Table 1

Tube No	Top of tube 1	←— Batch No —→ 2	3	Bottom of tube 4
1	4 Stage I	6 Stage IV	Larvæ hatched, mucus envelope left	4 Stage V
2	4 Stage I	5 Stage III–IV	2 Disintegrating	
3	3 Stage I	4 Stage III–IV	2 Stage I	
4	7 Stage I			
5	4 Stage III–IV	3 Stage IV	5 Stage V	

bottom to the top and all stages of development from fertilized egg to active pre-adult worm could be observed

At no stage was any swimming larva observed, and in fact the early larvæ appear to be atrochous Five arbitrary stages of external characters have been recognized in the development (1) large yolky uncleaved egg 150–200μ, (2), cleavage stages to gastrula, (3), early hatched larvæ—pyriform in shape and without obvious external features (250–300μ), (4), a more elongated form (350μ) with 2 velum-like branchial lobes and incipient ventral lip, 8 chætigers and both anterior and posterior eyes, (5), the final stage has nine of the adult eleven chætigerous segments, the branchiæ are well developed and the worm is crawling actively At this stage the young worms apparently leave the tube of the adult Table 1 gives the data derived from the tubes of five adult females and shows the number of batches in a tube, the number of individuals per batch, and the arbitrary stages of the individual's development

The information regarding reproduction in the Sabellidae has been summarized by Wilson[2] The most similar development to *Fabricia* appears to be *Dasychone lucullana* Delle Chiaje, the eggs of which are enclosed in a mucus sac shaped like a thick ring around the mouth of the tube of the parent Although in this case the early larva has a strong prototroch, it is not clear from the account of Claparède and Mecznikow[3] whether a swimming larva occurs

A Spartinetum at Baldoyle in Ireland

IN 1870, a species of *Spartina*, known later as *S townsendii* (H and J Groves), was collected from the mud-flats near Southampton It was growing in a mixed community of *S alterniflora* and *S maritima* (then *S stricta*) It resembled the latter species so strongly that it was labelled '*S stricta*', and was overlooked until 1878, when Townsend recorded the species officially in his *Flora of Hampshire*[1] It was assumed generally that the intermediate *S townsendii* was a hybrid between *S alterniflora* and *S stricta*, for example, Stapf[2] stated "the evidence is circumstantial but strong, resting upon many of the characters being intermediate between those of its presumed parents, *its pronounced instability, and its varying fertility*" [The italics are ours] In 1930, Huskins[3] furnished cytological evidence favouring this assumption when he found that *S townsendii* had a mitotic chromosome count of $2n = 126$, while *S alterniflora* and *S maritima* have $2n = 70$ and $2n = 56$, respectively.

From that time until recently, it was accepted that all *S townsendii* growing at Southampton would be amphidiploid In 1956, however, male-sterile plants were found at several localities near Southampton[4] They resembled the type specimens of *S townsendii*, and had a chromosome count of $2n = c$ 63 (ref 5) Thus it was established that the primary F_1 hybrid was still in existence in the area, and that it was sterile in all cases examined It was suggested that this sterile F_1 hybrid was *S townsendii*, that the seed-bearing *Spartina* had been incorrectly identified with *S townsendii*, and that this seed-bearing species was temporarily nameless

The only species of *Spartina* known in Ireland[6] was introduced as cuttings in 1925[7] It was planted soon afterwards in mud in the Baldoyle Estuary some eight miles north-east of Dublin, but was not officially recorded from that area until 1937[8] In November, 1958, an investigation was begun of the extensive and spreading meadow of *Spartina* which now fills part of the estuary The following interesting facts have already emerged from the investigation

Spartina plants show the "pronounced instability" and "varying fertility" recorded by Stapf[2] They vary in stature from short, stunted ones closely resembling *S maritima*, to tall vigorous ones which exceed *S alterniflora* in height by as much as 1 ft This range in stature is wider than that usually ascribed to the amphidiploid *S alterniflora* × *S maritima* It is paralleled by a correspondingly wide variation in the inflorescence, where one spike is very frequent on stunted plants, and up to sixteen have been found on tall, vigorous ones Lush growth is typical of older *Spartina* meadow where the plant is growing in foul-smelling, deep, soft mud, and is clearly visible at full tide, shorter stature is characteristic of meadow where the plant is growing in more sandy mud, and is completely covered for some time by every tide, finally, extreme stunting and a red colour characterize small clones growing in sandy areas bordering the muddy reaches of the estuary, they are covered by every tide Similar stunting has been observed by Chater and Jones[9] for *Spartina* plants growing in a sandy habitat in the Dovey Estuary

Male sterility is quite common In any clone, inflorescences vary from completely male-sterile to normal The term 'male-sterile' is used here to describe inflorescences in which the anthers fail to emerge, or if they do emerge, fail to dehisce, and in which pollen is variable in size and content 'Normal' inflorescences are those in which abnormalities were not observed Seeds have been found in inflorescences

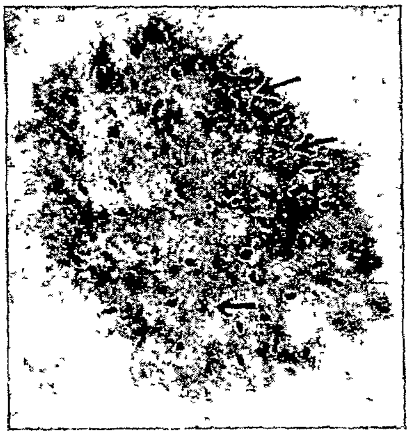

Fig 1 The three quadrivalents are marked with arrows

of all types and in all parts of the marsh, but so far, 80 per cent of the inflorescences contained 0–5 seeds only It was not possible to detect the presence of seed in spikelets except by dissection or touch The latter method was used All seeds were normal, and 100 per cent germination was obtained The chromosome number of all plants examined was $2n = 126$ (Fig 1) Three quadrivalents and 57 bivalents are present in the cell illustrated, and quadrivalents are common at meiotic metaphase Meiotic abnormalities were observed in some pollen mother cells of all anthers examined, multivalents, asynapsis and lagging chromosomes being the most usual

Male sterility has been used to distinguish the diploid hybrid *S alterniflora* × *S maritima* with $2n = 63$, from the tetraploid with $2n = 126$, but in the Baldoyle Estuary male sterility is quite frequent in clones with $2n = 126$ It is suggested, therefore, that until some clear-cut morphological distinction is observed, the name *S townsendii* (H and J Groves) is equally applicable to both known cytotypes.

Influence of Date of Flushing on Flowering in *Pinus banksiana*

NUMEROUS attempts have been made to relate the year-to-year variability in flowering of forest trees to seasonal fluctuations in weather conditions which, in turn, are believed to influence the internal physiological processes regulating flower initiation[1] The pronounced effect of photoperiod on flowering, noted in many herbaceous species, appears to be lacking in forest trees, and observations indicate that most trees are photoperiodically day-neutral[2,3] However, until more definitive experiments have been undertaken, photoperiod cannot be ruled out as a factor influencing flower formation

Since weather factors, primarily temperature and rainfall, appear to exert an influence on flower-formation, it may be that favourable weather conditions and/or photoperiod must be synchronized with a particular developmental stage of the bud for flower primordia to form It might be assumed that such synchronization would be thrown out of phase by an exceptionally early or late spring which would shift the receptive stage of development into a more favourable or unfavourable set of environmental conditions

To test this possibility, an exploratory study was conducted with jack pine (*Pinus banksiana* Lamb) Three-year-old potted trees were overwintered in outdoor cold-frames, and the following spring (1959), prior to normal flushing, the trees were transferred to a cold-storage room On the dates indicated in Table 1, lots of 30 trees each were brought into a greenhouse maintained at minimum temperatures of 60° F (night) and 72° F (day), late April and May day-temperatures usually exceeded this minimum in the greenhouse The plants were exposed to the natural photoperiod and were watered daily Shortly after the last group (May 18) was removed from cold storage, the trees of all treatments were transplanted in nursery beds and exposed to prevailing environmental conditions The controls were 3-year-old trees transplanted directly in the nursery beds 1 year prior to the treated plants and were therefore subjected to a natural environment during the spring of 1959 At the time of floral induction, the treated trees were in their fourth, and the controls in their fifth, growing season

Table 1 FLOWERING RESPONSE OF YOUNG JACK PINE TREES FOR VARYING DATES OF FLUSHING

Treatment date	Total No of trees	No of trees flowering				Total No of strobili	
		Male	Per cent	Female	Per cent	Male†	Female
4/ 6/59	28*	5	17 8	22	78 6	199	40
4/20/59	30	12	40 0	20	66 7	482	30
5/ 4/59	30	—	—	19	63 3	—	33
5/18/59	30	1	3 3	15	50 0	1	23
Control‡	123	—	—	70	56 9	—	134

* Excluding two trees that died in the nursery
† Male strobili produced in clusters of aments varying from 1 to 32 in number
‡ Control, 5-year-old trees, treated groups, 4-year-old trees

The results, shown in Table 1, are based on strobili counts made in late May and early June, 1960 The results show a marked superiority of the April 20 date for staminate, and the April 6 date for pistillate, strobili-formation This differential response is no doubt due to the location and the sequential initiation of the flower primordia of the two sexes Male strobili occur on the basal portion of the new shoot of older lateral branches whereas the female strobili, at least in young jack pine, occur primarily on the apical end of the main shoot contiguous with the lateral branch buds Jack pine is multinodal in the bud[4], and occasional female strobili may be found at the secondary whorl positions of the new shoot as well as at the apical end of the newly formed laterals These differences in position, which are characteristic of the genus *Pinus*[5], indicate that the staminate flowers may be laid down well in advance of the pistillate flowers, as shown for other members of the hard pine group[6–8]. Although phenological data are not available for jack pine, information for other species of *Pinus* indicates that the time differential between the initiation of flower primordia for the two sexes may be in excess of several weeks

Several environmental factors may contribute to the variable flowering response between treatments, the most obvious of which are photoperiod and temperature Each set of buds would be subjected to a different régime of photoperiod and temperature from the buds of the previous and subsequent treatments as they attained the stage of development at which flower primordia were initiated Photoperiod varies uniformly and can be readily evaluated Temperature and temperature-photoperiod interactions, however, cannot be readily evaluated under natural conditions as wide fluctuations occur throughout the growing season The possibility must also be considered that neither photoperiod nor temperature exerts a direct influence on flower initiation and that the differential response to treatment may be due to the length of the growing season available for bud-development Data have been presented indicating that source of seed also influences significantly the flowering response of young jack pine[9] Because of the preliminary nature of the present investigation, definite conclusions cannot be drawn, but continuation of the work under more exacting conditions may permit critical evaluation of the influencing factors

The data obtained nevertheless suggest that the seasonal fluctuations in date of flushing may be one of the factors responsible for variable flowering behaviour Such fluctuations would place the dates of male and female flower initiation in different sets of environmental conditions and these would vary from year to year Moreover, due to the vagaries of weather conditions, the same date of flushing in subsequent years may not necessarily evoke the same flowering response

Rootstock Influence on the Flowering of Seedling Apples

THERE has long been divergence of opinion as to whether or not the flowering of seedling trees, especially pome fruits, could be hastened by cultural practices or through environmental changes At the California Institute of Technology, it was found with *Pinus* that the 'juvenile' or initial non-flowering period of the seedling's life could be shortened following artificial lengthening of the period of summer growth and prolonged winter dormancy[1] In apples, any treatment that restricts or retards growth has been held by some to delay the onset of reproductive ability, while others have held the contrary view[2,3]

Experience at East Malling has long suggested that seedling material budded on the dwarfing Malling (*M*) IX (Jaune de Metz) rootstock fruited distinctly earlier than could be expected of seedlings on their own roots[4] No evidence was available as to whether this effect was attributable to the individual characteristics of the *M* IX rootstock as such or directly to its dwarfing and precocious character

In the course of a very considerable programme of crossing and selfing to produce, directly or through later back-crossing, apples combining eating quality with disease resistance and with the character of late flowering as a means of avoidance of spring frost damage, hundreds of seedlings selected from large families on the basis of late leafing and disease resistance have been retained on their own roots, to provide material for future propagation A bud from each of these seedlings, usually taken in the seedling's second year, has also been grown on one or other of two dwarfing rootstocks, *M* IX and 3431, the latter having the parentage *M* XIII × *M* IX Normal *T* budding on 18-month old bedded layers was practised

Table 1

Family No	No of seedlings	Trees on their own roots Flowering at five years	Flowering at six years	Flowering at seven years	Trees budded on *M* IX Flowering at three years	Flowering at four years	Flowering at five years

Totals	302	13	29	51	114

Thus, on *M* IX, 43 per cent had flowered in the sixth year from germination as against 3 per cent on their own roots On rootstock 3431, 38 per cent had flowered in six years from the seed as against 9 per cent on their own roots

As neither the families nor the period of experiment were identical, it is difficult to compare the effects of *M* IX and rootstock 3431 on such limited data It may not, however, be out of place to note that 3431 is more dwarfing than *M* IX[5] A more comprehensive experiment is needed if this clearly demonstrated effect of dwarfing rootstocks in reducing the 'juvenile' period is to be related more clearly to the degree of 'dwarfing' characteristic of the individual rootstock Further, it must not be forgotten that, while *M* XIII is markedly more vigorous, *M* IX is one of the parents of 3431 The possibility of a specific heritable attribute is therefore not excluded

It would seem[4,6] that the effect reported here is not to be related either to the relative mass or to the physiological age of the stock, since working small seedlings on large trees of long-established commercial varieties of apples had no effect on shortening the 'juvenile' period The work reported here supports the view that its length, while clearly susceptible to influence by dwarfing rootstocks, also varies markedly from seedling to seedling and from family to family

Replacement of an Alternating Temperature Requirement for Germination by Gibberellic Acid

IN many species of plants, seed-germination does not take place readily except under special conditions A barrier to germination may be imposed by the seed coats or other coverings, by the presence of germination inhibitors in some part of the seed, by morphological or physiological immaturity of the embryo, by the need for light or for its absence, or by the need for alternating temperatures during germination[1] Chemical substances can in some cases substitute for specific environmental factors in effecting seed germination Nitrates, for example, promote the germination of some light-requiring seeds in the dark[1], and the results of recent work indicate that the plant hormone gibberellic acid is particularly effective in overcoming several types of germination inhibition In the germination of 'Grand Rapids' lettuce seeds, the primary light-requirement[2,3] and the light-requirement induced by high temperature or dark-osmotic treatments[3] can be replaced by gibberellic acid Gibberellic acid overcomes the inhibiting effect of coumarin on lettuce seed germination[4] and of endogenous germination inhibitors present in *Avena fatua*[5] and *Betula* spp [6] seeds Kallio and Piroinen[7] found that gibberellic acid has a marked stimulating effect on the germination of seeds of 8 species, including *Gentiana nivalis* and *Geranium sylvaticum*, their experiments were conducted in the light at 24°

We have examined the effect of gibberellic acid on another type of germination inhibition, namely, that caused by a requirement for alternating temperatures A series of experiments has been conducted with *Asclepias fruticosa* seeds, which do not germinate at constant temperatures ranging from 10 to 35° C, but only at alternating temperatures[8] Repeated cycles of alternating temperatures are not essential, if the seeds are kept at 18° C for 7 days, transferred to 35° C for 4 hr and replaced at 18° C, 80–100 per cent germination is obtained within 3 days after the return to the lower temperature[8] These seeds are not light-sensitive

Table 1 EFFECT OF GIBBERELLIC ACID ON THE GERMINATION OF *Asclepias fruticosa* SEEDS

50 seeds per treatment No germination took place before treatment with gibberellic acid

Gibberellic acid (p p m)	Percentage germination after 2 days	4 days	6 days	8 days	14 days
0	2	4	4	4	4
1	2	4	4	10	20
10	16	30	46	56	72
50	12	50	74	82	96
100	12	64	92	94	96
500	6	16	26	34	38
1,000	0	0	0	6	10

The effect of gibberellic acid on the germination of *Asclepias fruticosa* seeds was studied at a constant temperature of 18° C in the light The seeds were placed on moist filter paper in Petri dishes After 3 days, the seeds were pricked by passing a fine needle through the seed coats, endosperm layers and cotyledons, and were transferred to Petri dishes containing filter papers moistened with gibberellic acid solutions at concentrations ranging from 0 to 1,000 p p m The results of a typical experiment are presented in Table 1 Rapid, almost complete, germination was obtained when the seeds were treated with 50 or 100 p p m gibberellic acid Concentrations of gibberellic acid lower than 50 p p m were less effective in promoting germination and concentrations higher than 100 p p m were inhibitory Gibberellic acid was completely without effect if the seeds were not pricked, which indicates that the seed coats and/or the endosperm layers may be impermeable to gibberellic acid In this respect, *Asclepias fruticosa* seeds are similar to those of *Geranium sylvaticum*[7], which do not respond to gibberellic acid unless they are first scarified with sulphuric acid

These results show that gibberellic acid is highly effective in replacing the need for alternating temperatures in the germination of *Asclepias fruticosa* seeds Experiments are in progress with the seeds of *Argemone mexicana*, which normally germinate only if subjected to repeated cycles of alternating temperatures in the presence of potassium nitrate, and the preliminary results indicate that gibberellic acid promotes rapid seed germination at a constant temperature in the absence of nitrate It will be of interest to determine how general the promotive effect of gibberellic acid on the germination of seeds having special requirements is The effect of gibberellic acid on dark-germinators, for example, does not seem to have been investigated

This work was supported by grants from the South African Council for Scientific and Industrial Research and the Department of Agricultural Technical Services We thank Messrs Chas Pfizer Inc, New York, for a gift of gibberellic acid

Relationship between 3,4-Dihydroxyphenylethylamine Content and the Genome, *acuminata*

THE major polyphenoloxidase substrate responsible for the blackening of the fruit of the banana has been identified[1] already as 3,4-dihydroxyphenylethylamine Although the original work was carried out using material of the clones Gros Michel and Mysore, a range of clonal varieties was investigated afterwards to determine whether this substrate was responsible for blackening in other clones or whether other phenolic compounds were implicated in the blackening reaction

It has been found that in all clones of the edible banana investigated the major polyphenoloxidase substrate is 3,4-dihydroxyphenylethylamine and furthermore that a positive correlation could be shown between the content of 3 4-dihydroxyphenylethylamine and the extent of the contribution of the genome *acuminata* to the genotype

It is now recognized[2] that the majority of the edible bananas had their origin in only two wild species, *Musa acuminata* and *M balbisiana* Simmonds and Shepherd[3], using a scoring method, were able to establish the relative contribution of the two wild-species to any given clone The genetic composition of each of the clones investigated is shown in Table 1 All plant material for the investigation was obtained from the collection of banana plantings at the Imperial College of Tropical Agriculture, Trinidad Earlier work on the distribution of 3,4-dihydroxyphenylethylamine in the banana indicated that although

A, Genome, *acuminata*, *B*, genome, *balbisiana*

present in small amounts in the pulp, larger amounts were present in the skin of the fruit Extracts of the skin were therefore used for the comparative investigations described here

Methanolic hydrochloric acid extracts of skin tissue obtained from a range of clones were prepared by methods described before 0 02 ml of each extract was applied to duplicate paper chromatograms (Whatman No 1) and subjected to two-dimensional development with butanol/acetic acid/water (40 10 50) followed by 2 per cent acetic acid One member of each pair of duplicate chromatograms was sprayed with *p*-nitroaniline reagent and the other with a banana polyphenoloxidase preparation After incubation of the enzyme-sprayed chromatogram in a humid chamber, brown colorations developed in the position corresponding to that of 3,4-dihydroxyphenylethylamine The size and intensity of the spots obtained with *p*-nitroaniline reagent in the position were proportional

The results which are shown in Table 1 indicate that the content of 3,4-dihydroxyphenylethylamine is determined by the extent of the contribution of the *acuminata* genome to the genotype

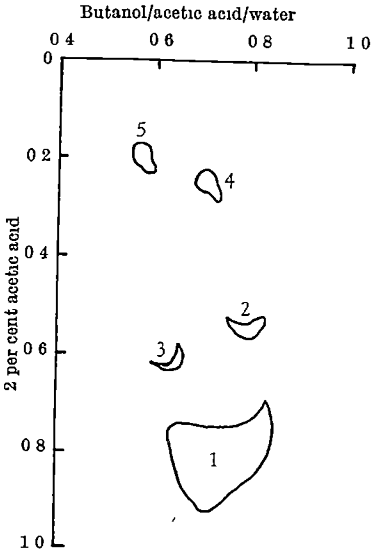

Fig 1 Composite diagram showing the position of fruit phenolics of banana cultivars 1, 3,4-dihydroxyphenylethylamine, 2-5, unknown minor phenolic constituents (Colorations with *p*-nitroaniline 1, purple, 2 and 3, red, 4 and 5, brown Ultra-violet fluorescence 2, white, 3, green, 1, 4 and 5, non-fluorescent)

Two-dimensional chromatography (Fig 1) showed that 3,4-dihydroxyphenylethylamine is the only major phenolic present in the fruit investigated Although a number of minor phenolic constituents were detected, these were present in trace quantities only and clearly did not contribute to any appreciable extent to the blackening of the fruit Clonal differences were almost wholly quantitative, the same phenolics being present in all the clones to a varying degree The major source of variation was (as noted in Table 1) the content of 3,4-dihydroxyphenylethylamine, the amounts present ranging fron trace quantities in *M balbisiana* varieties to very high levels in the *M acuminata* cultivars

CYTOLOGY

Cytology and Origin of the Dwarf Coconut Palm

DISTINCT varieties of dwarf coconut (*Cocos nucifera* L) occur in Malaya, Philippines, Fiji Islands, Viet Nam, Ceylon and India These varieties grow to a height of 15–30 ft compared with more than 50 ft among normal tall types and need only 3–5 years to commence bearing in contrast to 8–10 years taken by the tall strains While the tall varieties are largely obligatorily cross-pollinated, the dwarfs usually undergo self-pollination owing to the overlapping of the female and male phases in the same inflorescence As a result, many dwarf strains yield homogeneous progenies and they can be used with advantage for identifying the most pre-potent males[1] The poor vigour and copra quality of the dwarf palms, however, render them unsuitable for cultivation on a plantation scale[2] In addition to the typical tall and dwarf palms, various intermediate categories occur in Nature and have also been obtained by crossing the tall and dwarf strains[3]

Several semi-tall and dwarf varieties of coconut show 15–35 per cent pollen sterility, as judged by a tendency to become stained with aceto-carmine The tall varieties, on the other hand, contain less than 5 per cent of sterile pollen[4] A detailed study of meiosis in microsporocytes was hence undertaken in two tall, one semi-tall and three dwarf palms While meiosis was always regular in the tall plants, the following abnormalities occurred in several cells in the others (*a*) one quadrivalent at diakinesis and metaphase I, suggesting heterozygosity for a reciprocal translocation, (*b*) a dicentric bridge and an acentric fragment at anaphase I indicating heterozygosity for an inversion, (*c*) nucleoli which persist at metaphase and anaphase I, (*d*) pollen mother cells with varying chromosome numbers, (*e*) lagging chromosomes at the first and second anaphase and (*f*) sporads with varying number of spores There was also a significant reduction in chiasma-frequency in Apricot (semi-tall) and Green (dwarf), as compared with the two tall varieties The percentage of cells with abnormalities at different stages of meiosis in the varieties examined is given in Table 1

Table 1 MEIOSIS IN SOME COCONUT VARIETIES

Variety	Type	Percentage of cells with abnormalities at Metaphase I	Anaphase I	Second division	Sporad
Laccadive ordinary	Tall	0	0	0	0 8
Local type	Tall	0	0	0	0
Apricot	Semi-tall	20 4	40 1	24 7	29 2
Dwarf red	Dwarf	4 0	23 6	8 6	7 9
Dwarf green	Dwarf	0	5 1	2 9	4 3
Dwarf yellow	Dwarf	0	4 6	2 2	1 3

The occurrence of various abnormalities and 'chromosome mosaic' cells at meiosis, and a poor development of the endosperm in the dwarf palms, indicate that the efficiency of the chromosome mechanism has been affected in somatic, gametic and endosperm cells It is probable that the imposition of inbreeding on a normally out-crossed species is responsible for this situation, since it is known that inbreeding upsets the chromosome mechanics in cross-pollinated species[5-7] Some authors[3,8] have suggested that the dwarf strains of coconut may have originated through a sudden discontinuous mutation from the common tall palm From the cytological results it seems equally probable that the dwarf coconuts occurring in Nature in different countries may be the products of inbreeding among different tall varieties This view is also supported by the following First, the tall and dwarf palms differ in not one but a series of characters all of which seem to lead to reduced vegetative vigour and aberrant cytological behaviour Secondly, all gradations between the two contrasting categories represented by typical talls and dwarfs occur in Nature Thirdly, the F_2 progeny of a dwarf × tall cross gave a wide range of segregates and the data did not suggest any simple genetic explanation[2] The more regular meiosis observed in the dwarf varieties in comparison with the semi-tall type suggests that with progressive inbreeding an equilibrium condition may be reached with regard to cytological behaviour The same may also be true of vegetative vigour An initial mutation, if any responsible for the origin of the dwarf coconut might have led to the overlapping of the male and female phases of the inflorescence, thus rendering self-pollination both possible and predominant However, self-pollination can occur in the tall palms during certain seasons and a mutation facilitating this process is not a prerequisite for inbreeding to occur Alternatively, a situation analogous to that described by Harland[9] in the maize strains of Trinidad may be responsible for the evolution of stable self-pollinating dwarfs

Whatever may be the mode of origin of the dwarf coconut, the fact that many geographically distinct and true-breeding dwarf strains exist indicates the possibility that they may be useful both to estimate and exploit heterosis in coconut Much of the hybridization work carried out on coconut so far relates to crosses between tall and dwarf varieties or among tall strains The only record of a cross between two geographically distinct dwarfs seems to be that made by Marechal[10] between two dwarf strains from Malaya and the Fiji Islands The F_1 plants of this cross showed outstanding performance and have been much sought after in Fiji[11] Harland[1] has suggested the induction of haploidy in coconut for obtaining homozygous genotypes and, if the view that some dwarf coconuts represent stable inbred lines is correct, they may serve the same purpose as the autodiploids derived from haploids Harland's technique for identifying pre-potent males would be ideal for estimating combining ability in different dwarf × dwarf crosses

We are indebted to Drs B P Pal and A B Joshi for their interest in this work and to Prof S C Harland for advice on the manuscript

MICROBIOLOGY

Factor converting Mesophilic into Thermophilic Micro-organisms

IN the course of work on thermophilic, aerobic, spore-forming bacteria, we have observed that the thermophilic cells contain, in certain conditions, a principle, which, when added in small quantity to a fresh culture medium, permits an inoculum of a mesophilic organism to grow at elevated temperatures Moreover, this induced thermophily is carried from one transfer to another for an indefinite period

Concentrated preparations of this factor produced the effect in quantities of 5 μgm per ml of medium The properties, described here, suggest that the factor is in the nature of a nucleoprotein We have also observed that it is only present, or at least extractable, during vigorous growth of the thermophilic culture, but not after the exhaustion of nutrient has led to sporulation

The addition to a medium of an autolysate obtained from *Saccharomyces cerevisiae* also permitted the growth of a mesophilic inoculum at 55°, but this effect appears to differ from that obtained by the homologous factor inasmuch as thermophily cannot be indefinitely maintained without renewed addition of the yeast factor

The source of the principle is *Bacillus stearothermophilus* No 194, grown in a medium described elsewhere[1], and supplemented with 1 per cent casein hydrolysate This medium was inoculated with a stock culture of the thermophilic bacillus and incubated overnight at 55° This culture, now germinated, was inoculated into fresh basal medium and incubated at 55° for 9–11 hr, this procedure resulted in a small amount of spore-formation Incubation for 15 hr or longer periods, when sporulation had set in, did not yield the principle

After an incubation period of 9–11 hr, cells were collected in a Sharples refrigerated centrifuge at 50,000 r p m Packed cells were washed by homogenization in a Waring blendor with cold distilled water and again centrifuged The packed bacilli were lyophilized and stored at 4° C The converting factor was obtained from the lyophilized bacillus powder by suspension in 0 05 *M* sodium citrate and grinding with glass beads (type 112, Minnesota Mining and Mfg

Co , U S A) for 10 min in a Waring blendor at 4° C The debris was centrifuged off at 2,000 r p m , the remaining cell suspension was further centrifuged at 5,000 r p m for 6 hr at 4° C The supernatant was discarded The residue was extracted twice with 50 ml of 2 *M* sodium chloride, the transforming factor is not stable in aqueous solution The extract, diluted with 0 16 *M* sodium chloride, was added in varying amounts to a medium, which was then inoculated with a mesophilic strain of *B sphaericus* This mesophil was found to grow at 37° in 0 5 per cent beef extract (Difco) plus 0 5 per cent proteose peptone (Difco) but not at 55° It now grew at 55° on addition of the converting factor down to dilutions of 5 µgm /ml , growth is still obtained at 37° with or without addition to the principle

The converting principle is destroyed by deoxyribonuclease, ribonuclease, pepsin and papain (Worthington Biochemical Corp , U S A), while trypsin, chymotrypsin, and carboxypeptidase do not inactivate it The principle is non-dialysable against distilled water, and is unstable in aqueous solution as compared with 2 *M* sodium chloride This behaviour is similar to that of deoxyribonucleic acid[2]

The factor will stand 1 min of heating at 100°, but its heat stability is influenced by the rate of cooling, its efficacy will be less diminished if cooling is carried out slowly, for analogous observations on depolymerization of bacterial nucleic acid, see ref 3

These findings suggest that the factor is nucleoprotein Nucleic acid preparations from thermophilic bacteria were not effective In order to test substances rich in nucleic material, yeast autolysate (Albimi Laboratories, Brooklyn, N Y) was tested and a similar transformation of the mesophilic organism was observed[4] Growth in medium containing yeast autolysate was required to maintain thermophily, contrary to this finding, once thermophily was induced with thermophil extract, it was no longer required to maintain thermophily on repeated sub-culturing Attempts to purify and compare the converting factor from the thermophilic bacteria and from yeast autolysate are now under way We are also studying the specificity of the effect

Influence of adding Salts to the Medium on Counts of Phenol-treated *Escherichia coli* on Membrane Filters

IT has been shown[1] that suspensions of *Escherichia coli* which had been treated with phenol gave lower counts on membrane filters than on the surface of nutrient agar Many workers[2] have observed that bacteria which have been exposed to bactericides or heat exhibit a marked sensitivity to the nature of the subculture medium, and both Flett *et al* [2] and Jacobs and Harris[3] have shown that when ferric chloride was added to the medium it exerted a beneficial effect, demonstrated by longer extinction times than in control media, on the growth of phenol-treated organisms The latter workers found that the rate and extent of the death of phenol-treated cells of *E coli* and *Staphylococcus aureus* which occurred in nutrient broth[4] was reduced by the inclusion of $5 \times 10^{-3} M$ of magnesium chloride, and that the inclusion of ferric chloride and other metal chlorides in nutrient agar gave surface-viable counts of such cells greater than were obtained on nutrient agar without metals[5] In view of the present widespread use of membrane filters, and suggestions that these filters should be used to recover damaged cells from a variety of harmful environments, for example, in sterility tests, it was thought useful to examine the effect of adding salts to the nutrient broth on which the membranes are incubated

Chlorides of iron, chromium, calcium, magnesium and magnanese were added to the nutrient broth ('Oxoid *CM* 15', 16 gm /l) before sterilization to give concentrations of 0 0037, 0 00185, 0 000925, 0 00037, and 0 000185 *M* The method of counting has been described in ref 1, ten drops of a diluted suspension were placed on the surface of the membrane and counts on membranes using media containing added salts were compared with those obtained on a control nutrient broth, without salts In this work only one strain of *E coli* was used (strain *A* of Harris and Richards[1]), since two of the strains used in the earlier work were known to behave similarly when salts were added to nutrient agar

The counts of untreated cells did not differ significantly from those on the control whatever the nature or concentration of the cation used, and the results are not presented here Table 1 gives the mean percentage counts from phenol-treated suspensions in numerous trials at each concentration of the cations, and the significance of the results, given by the analysis of variance test, is indicated also In contrast to untreated cells, counts of phenol-treated cells were influenced markedly by the presence of salts However, only iron influenced favourably the counts from treated suspensions at all the concentrations used except at 0 00037 *M* of chromium and 0 000925 *M* of calcium and magnesium, with which counts did not differ significantly from the control, these three cations also gave favourable responses Manganese gave variable results and counts were greater and less than on the control with equal frequency The most favourable of the concentrations tested was 0 00185 *M* with all the cations, and the improvement in counts was most marked with chromium and iron

Possible mechanisms for the beneficial action of salts have been discussed by Jacobs and Harris[4].

Table 1 MEAN RELATIVE MEMBRANE FILTER COUNTS OF PHENOL-TREATED *E coli* ON MEDIA CONTAINING VARIOUS CONCENTRATIONS OF A RANGE OF CATIONS

925	221	179	100†	99†	41§
370	174	159†	167	140	136†
185	166	183	165	180	157

* Relative to nutrient broth without added salt as 100

† No significant difference from control , § significantly less than control, all others significantly greater than control, all at the 5 per cent level at least

They suggested that substances in the medium which are toxic to damaged cells could be removed by adsorption on metal precipitates or by co-precipitation with them, and that cations which are not precipitated could reduce the permeability of the damaged cell membrane and so reduce the inward diffusion of such toxic substances and the leakage from the cell of vital metabolites[6,7] The protective influence of metallic cations, especially those of high valency, against the action of phenol has been observed in ref 7

Enzymic Inactivation of Trichothecin and Crotocin

WORK on the inhibitory action of trichothecin[1] and crotocin (substance *T*, ref 2) on the inductive amylase synthesis of *Penicillium chrysogenum*[3] suggested that these antibiotics may undergo enzymic inactivation in certain circumstances The possibility of such an enzymic inactivation was first recognized by Darpoux and Faivre-Amiot[4]

Penicillium chrysogenum was grown on a synthetic medium as described previously[5] Cultures for the experiments were prepared by inoculating 200 ml synthetic medium with 10 ml of a 72-hr -old vegetative mycelium suspension The fate of crotocin added was examined by two different methods First, the antibiotic was added in a 1 mgm /ml single dose after 48 hr incubation The level of the antibiotic in such a culture remained unchanged for a minimum of 24 hr as revealed by the Bradler[6] agar-diffusion method In the second series of experiments 10 μgm / ml crotocin was added after 40 hr and this was followed by the addition of 1 mgm /ml of the same antibiotic after 48 hr incubation Under these experimental conditions a 70 per cent decrease in the antibiotic activity of crotocin was observed in 5 hr

This phenomenon suggested the possible presence of a crotocin-inactivating enzyme in cultures pretreated with a low dose of the antibiotic The enzyme appeared to be bound to the mycelia as the supernatant was inactive, while 1 gm of washed mycelium (calculated on dry material) inactivated an average of 40 mgm crotocin per hr The preliminary examinations carried out up to now indicated that the enzyme was probably bound to the cell-wall of the mycelium

It is known that trichothecin is an ester of trichothecolon and isocrotonic acid[7] The alcoholic component of crotocin is very similar, though not identical, to that of trichothecolon It seemed plausible that the decrease of the biological activity was a result of enzymic cleavage of the ester linkage The validity of this assumption was later confirmed by isolating and chromatographing the split products

After inactivation of crotocin by washed mycelia the mixture was filtered and the fluid phase was saturated with sodium chloride and extracted with chloroform at *p*H 10 (ref 8) The extract was evaporated and the oily residue crystallized from benzene The isolated substance had a melting point of 155 5° C , identical with the melting point of the alcoholic component obtained by alkaline hydrolysis of crotocin Mixed melting points of the two materials obtained by the two different methods did not exhibit any depression The acid component was identified by paper chromatography

According to the above observations crotocin if applied in small quantities can act as an inductor The enzyme thus induced is able to hydrolyse the ester linkage in the antibiotic which destroys its biological activity On the addition of a single large dose of crotocin no inactivation of the antibiotic activity could be observed since this quantity inhibited also the synthesis of the inductive enzyme Crotocin might be replaced by trichothecin, both as an inductor and a substrate

Other fungi such as *Penicillium urticae*, *Aspergillus parasiticus* and *Aspergillus oryzae* failed to exhibit similar action *Aspergillus niger*, however, when tested under the same experimental conditions, had an effect similar to that observed for *Penicillium chrysogenum*

Detection of Gibberellic Acid in *Azotobacter* Cultures

IT is known that *Azotobacter* cultures can affect the germination of seeds and growth of plants It is assumed that this influence is due to the presence of physiologically active substances and vitamins in the cultures Actually, indole-3-acetic acid has been detected in *Azotobacter* cultures[1,2] In a previous paper[2] the detection of another growth-active compound, in addition to indole-3-acetic acid, was described More details about this compound, which appeared to be gibberellic acid, are presented here

Azotobacter chroococcum was grown in Burk's solution containing traces of molybdenum and boron, the same procedure as that used for growth of cultures when isolating indole derivatives[2] The medium did not contain calcium carbonate, however After ten days of incubation the culture was centrifuged, the supernatant evaporated *in vacuo* to a tenth of its original volume, made acid with 1 *N* hydrochloric acid (to *p*H 2 8–3 0) and extracted with *n*-butanol[3] or

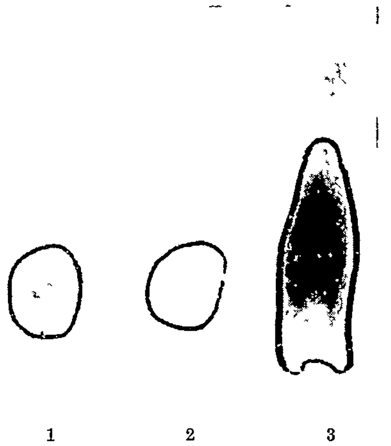

Fig 1 Chromatogram of gibberellic acid from culture of *Azotobacter chroococcum* 1 and 3, various concentrations of n-butanol extract, 2, 50 µgm of gibberellic acid

peroxide-free ether[2] Individual extracts were placed on Whatman No 1 filter paper and chromatograms developed in four systems butyl acetate saturated with water[3], benzene / pyridine / 3 M - ammonium hydroxide (3 6 1)[4], benzene/acetic acid/water (10 2 5 5)[5] and n-butanol/formic acid/water (4 1 5) Best separation of indole-3-acetic acid from gibberellic acid was obtained in butyl acetate saturated with water Gibberellic acid remained at the start ($R_F = 0\ 1$) while indole-3-acetic acid moved nearer the front ($R_F = 0\ 8$).

The last-named system, however, has the drawback of forming 'tails' behind the spots of both acids From the point of view of shape and sharpness the system with acetic or formic acid is more advantageous as dissociations of indole-3-acetic acid and gibberellic acid are suppressed and sharp round spots are obtained In the formic acid system the R_F values of the two growth substances are very close, which represents a handicap in elution of the spots from the chromatogram and in biological testing of the eluate

Detection of gibberellic acid on chromatograms was carried out with 3 per cent sulphuric acid in methanol followed by heating to 60° C for 5 min [4], or with 0 5 per cent aqueous potassium permanganate[5] By adding 0 05 per cent ferric chloride to the methanolic sulphuric acid the reagent can be used for detecting both indole-3-acetic acid and gibberellic acid Indole-3-acetic acid gives a violet-red colour and displays no ultra-violet fluorescence while gibberellic acid shows a blue-green ultra-violet fluorescence but gives no colour reaction in visible light

The position of the spot of the substance tested which gives a colour reaction with both reagents corresponds in all the four systems used to the R_F of a standard solution of gibberellic acid- Fig 1 shows a chromatogram developed for 8 hr in benzene–pyridine–3 M ammonium hydroxide (3 6 1) in the downward direction We used the system described by Bird and Pugh[5] to demonstrate that the *Azotobacter* strains contain mostly gibberellic acid (gibberellin A_3) rather than gibberellin A_1 The chemical detection of gibberellic acid was confirmed by a biological test Undetected spots corresponding to gibberellic acid on the chromatograms were eluted with distilled water and a part of the eluate was tested on etiolated sections of maize leaves and mesocotyls, as described by Boyarkin and Dmitriyeva[6] The test is specific for gibberellins Indole-3-acetic acid, if present in the solution tested, has a slight inhibitory effect A positive significant influence of the eluate on longitudinal growth of the maize leaf was established

The positive influence of the biological test, together with the results obtained by paper partition chromatography technique, indicates the presence of gibberellic acid in *Azotobacter* cultures The amount of gibberellic acid in the supernatant of a 10-day-old culture varied under the above cultivation conditions between 2 and 5 µgm /ml In a 17-day-old culture, where the source of carbon had been exhausted, the amount of gibberellic acid rose to 20 µgm /ml It is assumed that the presence of gibberellic acid together with indole-3-acetic acid in *Azotobacter* cultures can have a connexion with the frequently noted effect of *Azotobacter* cultures or their filtrates on germination of seeds or growth of seedlings

So far as is known from the literature the presence of gibberellic acid has been demonstrated in cultures of *Fusarium moniliforme*[7] and other *Fusarium* species[8], of some non-identified Actinomycetes[8] and of the soil yeast *Torula pulcherrima*[9] The finding described here supplies evidence for the existence of gibberellic acid in *Azotobacter chroococcum* Beij. It appears that gibberellic acid is more prevalent among micro-organisms than was believed, even if in lower concentrations than those found in *Fusarium* cultures

I am indebted to M Podojil of the Institute of Biology for a gift of a mixture of gibberellin $A_1 + A_3$

Nutritional Requirements for the Induced Formation of Malic Enzyme in *Lactobacillus arabinosus* (17-5)

In 1948, Korkes and Ochoa[1] described an enzyme preparation from *Lactobacillus arabinosus* which catalysed the conversion of L-malic acid to lactic acid and carbon dioxide They called it malic enzyme. The activity of this enzyme was found to be very low in organisms grown on ordinary medium When malic acid was also included in the medium during growth, the ability of the organisms to break down malic acid was found to have increased about fifty times They also demonstrated that the presence of the growth medium and glucose was essential to the formation of the enzyme

The growth medium of *L arabinosus*, like that of other lactic acid bacteria, is very complex It contains hydrolysed casein, a mixture of inorganic salts, glucose, and special supplements of amino-acids, vitamins, purines and pyrimidines Gale has shown[3]

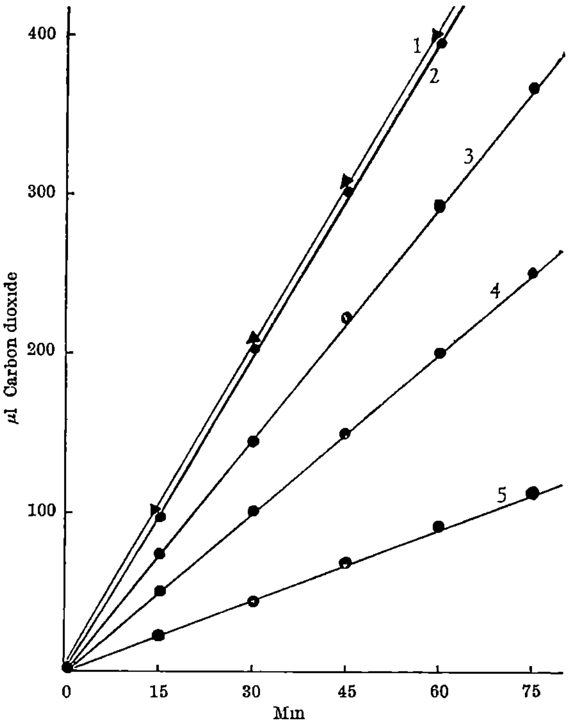

Fig 1 The effect of nutrition on malic enzyme induction The samples contained 0 04 *M* L-malic acid, *p*H 6 0, manganese ions, 0 1 *M* phosphate buffer and 5 0 mgm dry weight cells, suspended in phosphate buffer Curve 1, complete medium, curve 2, supplement containing eleven amino-acids and a purine/pyrimidine mixture, curve 3, supplement containing eleven amino-acids only, curve 4, supplement containing purine/pyrimidine mixture only, curve 5, control, contained no supplement In all cases the incubation mixture also contained 1 per cent glucose, manganese ions and phosphate buffer

that the nutritional requirements for optimum growth of organisms may differ from those necessary for the formation of a particular enzyme, and in a recent review Lichstein[4] has directed further attention to this phenomenon It was interesting, therefore, to find out which constituents of this complex medium may be more directly involved in the formation of malic enzyme

The activity of malic enzyme in intact cells of *L arabinosus* was determined manometrically, by recording the evolution of carbon dioxide from malic acid, at *p*H 6 0 and 30° C using small Warburg flasks

In order to separate the requirements of induced enzyme formation from those of growth, it was necessary to use resting cells in these experiments The organisms were collected from the ordinary growth medium by centrifugation, washed and re-suspended in phosphate buffer (*p*H 6 0) The cell suspensions were incubated for 90 min with malic acid (adjusted to *p*H 6 0 with sodium hydroxide), glucose, manganese ions and the supplement to be tested That no net growth occurred during the incubation period was judged from optical density measurements After the incubation period, chloramphenicol was added to the incubation mixture to prevent the formation of more enzymes. The cells were again separated by centrifuging, resuspended in buffer containing chloramphenicol, and their ability to dissimilate L-malic acid was determined manometrically

In the initial experiments, the supplement used in the incubation mixture was made up of 5 per cent vitamin-free casamino-acids and a purine/pyrimidine supplement, and the results showed that enzyme formation had been stimulated to the same extent as in the control which contained the complete medium The investigation was therefore limited mainly to testing the effect of various amino-acids, purines and pyrimidines in promoting the formation of malic enzyme The vitamin-free casamino-acids were then replaced by a mixture of the 19 amino-acids known to be present in hydrolysed casein Finally the amino-acids were appropriately deleted and substituted until it was found that a mixture of the following eleven amino-acids could promote malic enzyme synthesis to the same extent as the complete mixture of nineteen acids

L-arginine, L-cystine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, DL-phenylalanine, L-tryptophan, L-tyrosine and DL-valine, the final concentration of each amino-acid in the supplement being 25 mgm per 100 ml The purine/pyrimidine supplement consisted of adenine sulphate, guanine, thymine and uracil, the final concentration of each base being 10 mgm /100 ml

When tested separately the amino-acid mixtures proved more effective than the purine/pyrimidine supplement in promoting the synthesis of the malic enzyme in this organism But only when added together was the enzyme formed to the same extent as in the presence of the complete growth medium (Fig 1)

It was interesting to find that the vitamin supplement showed no effect in promoting synthesis of the enzyme, especially since a large number of vitamins have to be provided if this organism is to grow successfully in a synthetic medium. Ochoa and others had also demonstrated the inability of cells starved of biotin to form malic enzyme It is possible, however, that washed suspensions of normal cells contain enough vitamins to permit the formation of this induced enzyme

VIROLOGY

Influence of Tomato Mosaic Virus Infection on the Hollow Fruit Condition of Tomatoes

INFECTION of tomato plants by tomato mosaic virus (T M V) may have a very considerable influence on the quality of the fruit harvested It has been demonstrated[1,2] that poor colouring and/or fruit bronzing may follow virus infection

Hollowness is the term used to describe a condition of the maturing fruit in which the pericarp becomes separated by a cavity from the seed-bearing axial placenta (Fig 1) This cavity may be either discontinuous or continuous, in the latter event separating the seed-bearing pulp entirely from the pericarp The hollow condition is especially a feature of tomato varieties yielding bilocular fruits, as the fruit wall is less rigidly supported by the carpels than is the case with the fruit of tri- or multi-locular varieties As a consequence of this, when hollowness is associated

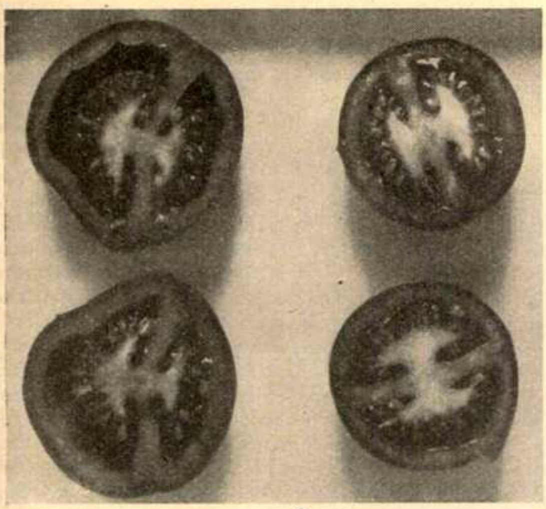

Fig. 1. Left, hollow bilocular fruit; right, normal bilocular fruit

with bilocular fruits, they frequently assume a flattened, angular appearance. This misshapen appearance, coupled with a lack of firmness and poor eating qualities, makes for low market value.

While investigating several aspects of the hollow fruit problem the relationship between this and tomato mosaic virus infection was examined. From a series of glasshouses, sparsely infected with virus, pairs of infected and virus-free plants were contrasted. Ten such random pairs were examined in each of twelve widely separated glasshouses. In all cases the numbers of hollow tomatoes borne on four consecutive trusses were compared with the total number of tomatoes on the same four trusses.

The results are presented in Table 1.

Table 1

Series	Plants	No.	Ratio sound/ hollow tomatoes	Standard deviation	Difference (per cent)
1	T.M.V. infected	10	6·45	± 0·96	66·2*
	Non-infected	10	19·35	± 3·95

* Significant differences at $P = 0{\cdot}01$
† Significant differences at $P = 0{\cdot}05$

The standard deviations obtained from the data collected from non-infected plants are variable and frequently larger than those obtained from infected plants. It is likely that these high standard deviations indicate, in some cases, the fallibility of visual diagnosis of virus-infected plants. The more regular standard deviations occurring for infected plants, which are easily identified, support this theory.

Experimental methods utilizing inoculated plants would probably produce much more even data. Nevertheless, the results suggest that a relationship exists between tomato mosaic virus infection and the incidence of hollow fruit.

Growth of Contagious Pustular Dermatitis Virus in Human Tissue Cultures

Contagious pustular dermatitis or 'orf' is a well-known disease of sheep which occasionally causes lesions, usually on the hands or face of people who work with sheep or their carcases. Such lesions may be difficult to distinguish from those caused by cowpox virus or by certain bacteria and fungi and a simple means of laboratory confirmation would be useful. Human infections may be confirmed by transmitting the virus to sheep and carrying out cross-immunity tests; but this is laborious and seldom used. A complement-fixation test using sheep material as antigen was used by Macdonald[1], but is not very sensitive. The virus will not grow in the developing chick embryo—which distinguishes it from cowpox virus—or in any of the smaller laboratory animals.

Plowright *et al.*[2] described the growth of contagious pustular dermatitis virus in sheep testis and kidney tissue culture. We have found that a stock strain of the virus grows well in lamb embryo kidney tissue culture in monolayers. Using a medium containing 10 per cent calf serum we have obtained average titres of 10^6 fifty per cent tissue culture infectious doses per 0·1 ml. of infected fluids on repeated passage at 36° C.

The identity of the virus was checked by rubbing tissue culture fluid into the shaved skin of a non-immune sheep and re-isolating the virus in tissue cultures from typical 'orf' lesions. Cross-immunity tests using three sheep were suggestive but not entirely satisfactory, because a reduced number of lesions developed in both challenged animals which had been vaccinated either with tissue-culture vaccine or the standard Burroughs Welcome vaccine. Cytopathic changes in lamb embryo kidney cultures included early rounding and swelling of the cells followed by clumping which superficially resembles the appearances seen with certain types of adenovirus grown in human embryo kidney cells. With heavy inocula of the virus, cytopathic effect was seen after 24 hr. and most of the tissue cells infected became detached from the walls of the tubes in three days. The virus appears to reach maximum titre in cells after three days and is then liberated into the medium.

Contagious pustular dermatitis virus which had been passed three times in lamb tissue was used to infect stationary cultures of human amnion, human embryonic kidney and human embryonic liver cells. In all types of cell the virus grew well, causing cytopathic changes similar, in unstained preparations, to those seen in lamb kidney cultures. The medium used for the growth of the virus in human amnion cells, which are widely used in virus diagnostic laboratories, contained 10 per cent calf serum.

Titrations of the virus in tissue cultures and direct isolation of the virus from experimentally infected sheep both suggest that human amnion cells may be the most suitable available method for isolating contagious pustular dermatitis virus from human lesions. In preliminary tissue culture experiments we have not been successful in demonstrating unequivocally the development of neutralizing antibody after infection in either sheep or humans. Using an antigen derived from infected lamb embryo kidney cultures we have shown that experimentally infected sheep develop significant rising titres, up to 1 : 64, of complement fixing antibody three weeks after infection. 'Orf' is locally common in certain parts of England and Scotland, but in our area it is rare and we have not yet had the opportunity to examine adequate specimens from the infection in man.

AGRICULTURE

A New Method of Estimating the Dry-Matter Intake of Grazing Sheep from their Fæcal Output

In a series of investigations on dry-matter intake and fæces output of ewes, at different feed-levels, it was observed that a particular fraction of the fæces, readily dissolved by treatment with dilute acid, was closely related to the intake of dry matter. It was considered that this dissolved fæcal fraction would be unlikely to contain any high proportion of food residues already subjected to fermentation and digestion in the alimentary tract but was likely to consist largely of the more soluble parts of the metabolic fraction of the fæces. It has already been shown that this fraction bears a close relationship to dry matter intake[1,2].

Total collection of the fæces was employed[3] and 1 gm. of the milled dried fæces was allowed to stand in 150 ml. of 0·2 *N* hydrochloric acid (containing a small quantity of wetting agent) at room temperature for 18 hr. After filtering through a paper disk in a Gooch crucible the amount of this dissolved fæcal fraction was determined and the total daily production calculated.

Further work during 1959 and 1960 involved a range of feeds, including fresh and dried herbage, fed at different levels of intake to ewes and wethers. For eleven feeds, including grass–clover mixtures, each fed to several animals, the relationship between daily dry-matter intake and the daily dissolved fæcal fraction output in gm. for 64 observations was $y = 250 + 17{\cdot}8\,x$, y being the predicted dry-matter intake and x the dissolved fæcal fraction output.

In the cases of two other legume feeds, lucerne and a clover mixture, dissolved fæcal fraction outputs were higher than those for grass and grass–legume mixtures at comparable levels of dry-matter intake.

The errors associated with the prediction of other y values for two values of dissolved fæcal fraction output for means of various numbers of animals are shown in Table 1.

Table 1

No. of animals in the group for which the prediction is made	Dissolved fæcal fraction daily output (gm.) 50		100	
	S.E. of estimate	Percentage error	*S.E.* of estimate	Percentage error
1	73·5	6·4	78·1	3·9
5	33·9	3·0	43·0	2·1
10	25·0	2·2	36·4	1·8
20	18·9	1·7	32·5	1·6

These levels of precision suggest that this method should be suitable for estimating the free grazing intake of ewes, without the need to develop separate 'local' regressions for each type of sward grazed.

This method overcomes some of the difficulties associated with some 'fæcal index' regressions used in the past since it is based on the relationship of dry-matter intake and dissolved fæcal fraction output, thus avoiding the error involved in applying regressions of fæces composition on dry-matter digestibility, developed at one level of intake indoors, to studies of grazing animals at different levels of intake.

Where the basic relationship is between the total output of a fæces component and feed intake, and the regression does not pass through the origin, fæces composition at any one level of feed digestibility will vary with intake.

These investigations are being extended and this method applied, in observations on grazing ewes, with the aid of a grant from the Agricultural Research Council.

Groundnut Variety, Mani pintar

Smartt, in a recent communication[1], mentions the very satisfactory performance of the groundnut variety, Mani pintar, in trials in Northern Rhodesia. In a series of trials on agricultural stations and on local farms in the Northern Region, Ghana, in 1960 the variety was outstanding, giving a mean yield 35 per cent higher than the local varieties, 24 per cent higher than previously released improved varieties and out-yielding all other recent introductions.

The variegated red and white testa characterizing the variety was found to be quite acceptable to the local farmer, who uses most of the crop for expression of the oil.

It is suggested that a variety with many excellent qualities and which has performed well in two widely separated African territories is worthy of widespread trial in other groundnut-growing areas.

I am grateful to Mr. Smartt for providing the original seed for my work.

Saturday, October 14

London County Council (at the Horniman Museum, London Road, Forest Hill, London, S E 23), at 3 30 p m —Dr J A Fraser Roberts "The Usefulness of the Blood Groups and some other Simply Inherited Characteristics in Anthropological Studies" *

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Assistant Lecturer (Grade B) in Mathematics—The Registrar, Flintshire Technical College, Connah's Quay, near Chester (October 13)

Assistant Lecturer in Zoology—The Registrar, The University, Nottingham (October 14)

Assistant Librarian (Acquisitions) (honours graduate with professional qualifications in librarianship and practical experience in an academic library)—The Secretary of University Court, The University, Glasgow, W 2 (October 14)

Lecturer or Assistant Lecturer (with an honours degree and practical experience of at least one branch of the food industry) in Food Science in the Proctor Department of Food and Leather Science—The Registrar, The University, Leeds 2 (October 14)

Tutorial Student (graduate or about to graduate) in the Department of Mechanical Engineering—The Registrar, King's College (University of London), Strand, London, W C 2 (October 14)

Postdoctoral Research Assistant, to work on high energy physics using the nuclear emulsion technique—Prof E H Bellamy, Department of Physics, Westfield College (University of London), London, N W 3 (October 20)

Scientific Assistant in the Chemistry Department, for the maintenance of physical instruments including spectrophotometers and radiochemistry equipment, duties will also include certain routine measurements and demonstrations—Head of the Department of Chemistry, Chelsea College of Science and Technology, Manresa Road, London, S W 3 (October 21)

Assistant Lecturer or Lecturer (preferably with a special interest in analysis or algebra) in Pure Mathematics—The Secretary, Birkbeck College (University of London), Malet Street, London, W C 1 (October 23)

Chemist, Chemical Engineer, or Physicist (with a university honours degree or equivalent in chemistry, chemical engineering or physics together with some years of research experience) in the Chemical Engineering Section, C S I R O , Melbourne, Australia, to undertake work of a fundamental nature in the fields of fluid dynamics, mass transfer and reaction kinetics—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting Appointment No 608/15 (October 28)

Research Fellow or Senior Research Fellow in the Department of Parasitology, University of Queensland, for duties which will include the instigation of research work on pathogenesis of parasitic infections in domestic animals, and also a certain amount of undergraduate teaching—The Registrar, University of Queensland, Brisbane, Queensland, Australia (October 28)

Assistant Systematic Botanist (honours graduate in botany or agricultural botany)—The Secretary, National Institute of Agricultural Botany, Huntingdon Road, Cambridge (October 30)

Laboratory Superintendent in the Department of Engineering, Fourah Bay College, University College of Sierra Leone—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (October 30)

Chair of Chemical Pathology—The Secretary, The University, Aberdeen (October 31)

Chemist (well qualified, with an interest in microbiology and enzyme chemistry), for research relating to the production of slipe wool—The Secretary, Wool Research Organization of New Zealand (Inc), P O Box 5115, Wellington, New Zealand, or the New Zealand Scientific Liaison Officer, Africa House, Kingsway, London, W C 2 (October 31)

Deputy (preferably with a degree in zoology) to the Director, Whipsnade Park, to assist the Director in the scientific and animal management work in the Park—The Secretary, Zoological Society of London, Regent's Park, London, N W 1 (October 31)

Lecturer or Assistant Lecturer in Anatomy at the University of Malaya, Singapore—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (October 31)

Lecturers (2) (with special qualifications and experience in the food industry (other than the dairy industry) or in biochemical engineering) in Food Science—The Registrar (Room 22, O R B), The University, Reading (October 31)

Professor of Mathematics or Professor of Applied Mathematics at the University of Natal, Durban—The Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S W 1 (South Africa and London, October 31)

Senior Lecturer and a Lecturer in Mathematics at the University College of Townsville, University of Queensland—The Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S W 1 (October 31)

Lecturer or Assistant Lecturer in Mathematics at the University College of Rhodesia and Nyasaland—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (November 5)

Chair of Physics in Makerere University College, East Africa—The Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W C 1 (November 10)

Lecturer in Psychology in the School of General Studies, Australian National University—The Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S W 1 (Australia and London, November 15)

Lecturer in Philosophy at Newcastle University College, The University of New South Wales—The Agent-General for New South Wales, 56 Strand, London, W C 2, and the Appointments Section, Box 1, Post Office, Kensington, New South Wales, Australia (November 17)

Lecturer in Anatomy at the University of Western Australia—The Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S W 1 (Australia and London, November 18)

Lecturer/Senior Lecturer (graduate with an appropriate degree and with postgraduate research and/or field experience in agronomy) in Agronomy at the University of New England, Armidale, New South Wales, Australia—The Secretary, Association of Universities of the British Commonwealth (Branch Office), Marlborough House, Pall Mall, London, S W 1 (Australia and London, November 30)

Assistant Professor in Pharmacology—Prof M F Murnaghan, University of Ottawa, Ottawa, Ontario, Canada

Experimental Officer (with a pass degree including chemistry or H N C in chemistry) in County Hall Laboratory, for duties which will involve research, control and development in a wide field of science—The Medical Officer of Health (D 1/N/2598/9), County Hall, London, S E 1

Head (with good qualifications in chemistry and teaching experience) of the Science Department—The Headmistress, Roedean School, Brighton

Keeper (with an honours degree and/or a museums diploma) of Ethnology—The Director, Liverpool Museums, William Brown Street, Liverpool 3

Laboratory Technician, for a research laboratory specializing in lipid analysis for metabolic studies—J A Balint, M B , M R C P , Division of Gastroenterology, University of Alabama Medical Center, Birmingham 3, Alabama, U S A.

Lecturer or Senior Lecturer in Education—The Principal, The James Graham College, Lawns House, Chapel Lane, Farnley, Leeds 12

Lecturer (preferably with experience in circuit theory and able to supervise research) in the field of Light Electrical Engineering—Head of the Department of Electrical Engineering, Imperial College of Science and Technology, London, S W 7

Lecturer (with an honours degree in chemical engineering or Corporate Membership of the Institution of Chemical Engineers, with experience in research and in the operation and supervision of full-scale chemical plant) in Chemical Engineering—The Registrar, The University, Nottingham

Master to teach Chemistry to all levels, including a substantial amount of sixth form work—The Headmaster, King's College School, Wimbledon, London, S W 19

Mathematicians (with an honours degree in mathematics, and preferably previous experience with computers) in the Computation Centre, National Research Council of Canada, for work which will involve the analysis and programming of problems which arise in the various scientific and engineering divisions of the Council—The Employment Officer, National Research Council, 100 Sussex Drive, Ottawa, Ontario, quoting Ref E R 210

Research Student in Inorganic Chemistry, for work concerned with inorganic polymers—The Professor of Chemistry, Westfield College (University of London), Hampstead, London N W 3

Research Students in the Department of Chemistry, for work on the inorganic chemistry of complexes in solution, polyacids, etc —The Registrar, Manchester College of Science and Technology, Sackville Street, Manchester 1

Technical Assistant (with a university degree or equivalent qualifications, and the ability to assist in the construction of research apparatus) in the Department of Applied Physics, to assist in research on subjective brightness—Head of the Applied Physics Department, Northampton College of Advanced Technology, St John Street, Clerkenwell, London, E C 1.

THE AMATEUR IN SCIENCE

IN an address on August 31 to Section L (Education) at the British Association meeting at Norwich, in which he surveyed some current programmes of research in education, Dr W D Wall, director of the National Foundation for Educational Research in England and Wales, commented that he was himself an amateur in research ; and he raised the question of the place of the amateur in research It is true that, in the physical sciences, the high cost of equipment has in itself largely eliminated the amateur and even the individual, but the position is perhaps too lightly accepted without due thought for the consequences It could be argued that the creative years of an individual scientist, in which his most important contributions are made, are those early years in which he is emerging from amateur or tyro to true professional status Again, it could be suggested that part of the value of mobility between one technology or one particular subdivision of a scientific discipline and another lies in the stimulus which a fresh outlook can supply.

To some extent this can be found in the research teams comprising scientists and technologists trained in different disciplines which are now commonly built up for the attack on problems which involve contributions from different disciplines, but it might be worth while to re-examine, under modern conditions, the contribution which the amateur could make, and the relations between amateur and specialist to-day, as well as the factors that most conduce to co-operation There could scarcely be a more serious reproach to the system of education in Britain than the admission of a leading educationist that the first task of institutions of further education is to awake the desire to learn, and in his presidential address to Section J (Psychology) Prof George Seth remarked that intellectual eagerness is by no means the most obvious characteristic of the university entrant of the mid-century Prof Seth was concerned particularly with the attitude of the student to knowledge, to learning and scholarship, and the disinterested search for truth If, as he pointed out, a student lacks concern for these matters, even the able student will be unfitted for the university environment, and it is also true that he may be handicapped in his subsequent professional as well as in his university career

It was therefore fitting that two of the sectional presidential addresses at Norwich should be concerned with aspects of amateurism or intellectual curiosity Prof Seth, who thinks that the universities may already be getting as many of the intellectual *élite* as they could expect, was much more concerned with the quality of teaching, and particularly the consequences if many of the brightest youngsters are taught largely by those who are intellectually less able than themselves Apart from this, he suspects that some of the teaching techniques in British universities have been ill-designed to encourage or to stimulate creative originality in their students He puts this fairly to the universities as in part their problem, though they may reasonably look to the schools for help What is looked for is imaginative freedom rather than conformity or preoccupation with satisfying the examiners, and Prof Seth rightly points out that such a quality can only flower in an atmosphere of freedom

Clearly there is here a line of research that should commend itself to the universities and to their psychology departments, as well as to institutions concerned with educational research, and the problem is urgent for if, in the immediate future, we must look to the schools to stimulate this quality, the universities should be striving to acquire teachers of sufficient number and quality to meet the need in all departments It is to the teacher that Prof Seth looks primarily, and he maintains that an active scepticism of traditional educational instruments, institutions and philosophy holds enormous possibilities for good A community that lives complacently on the inheritance of accumulated experience that we call tradition is already dead, however rich and splendid its past may have been, but Prof Seth also reminds us that, without that past, and without a clear and just appreciation of its meaning for us, our future advance will be feeble, lacking in impetus, uncertain and wavering in direction

There in some degree is expressed the case for co-operation between amateur and professional, and it might be held that the Earl of Cranbrook's presidential address to Section X on September 1 on "Science, Politics and Social Service" expounds that theme Insisting on the importance of the possession of a curious and inquiring mind, which is regarded as a main difference between man and other animals, Lord Cranbrook notes the bearing of intellectual curiosity and the scientific outlook on the advances in the seventeenth and eighteenth centuries He comments on the range of interest which marked the early Fellows of the Royal Society, and shows how out of such amateurism in the true sense arose the scientific societies of the eighteenth and nineteenth centuries As a result, the gradual advance towards universal compulsory education, which was fortunately faster than the gradual extension of the franchise, was accompanied by the growth of societies which encouraged men actively to do things for themselves as well as being educated passively by the educational methods of the day

Lord Cranbrook emphasized the majestic diversity of the thoughts and achievements of the great scientists of the sixteenth and seventeenth centuries, and pointed out that the ordinary educated man of those days could still make his contribution to science well on into the nineteenth century, and he does not accept as inevitable any divorce between science and the humanities He makes no ill-founded claims for political wisdom or judgment for the scientists, even for biologists or economists Scientists are just as ready as other men to fit themselves into the Procrustean bed of their own ideology and to study the humanities with all the blind prejudices of the most obscurantist politician The connexion between scientific and political thought to which he referred could only exist in the earlier stages of man's development, and the last great advance in scientific thought, which grew out of the Renaissance, built up a scientific discipline inapplicable to political or sociological problems In Lord Cranbrook's view, the scientist's training and method of approaching his problem no more fits him to be the arbiter of political thought than does that of the priest, the actor, musician or author

While Lord Cranbrook thus does not suggest that the scientist alone can put things right in the world, he certainly gives no support to the idea that the politician should know little or nothing of science or take pride in being, as Mr Harold Macmillan claimed at the Royal Society Tercentenary banquet, the only amateur remaining In the world of to-day, men and women in all spheres should understand what is happening and why, and the growth of leisure should facilitate this Moreover a well-balanced man or woman should be able to understand and enjoy, at least in part, both arts and sciences, very appropriately, since he was addressing the Assembly of Corresponding Societies, Lord Cranbrook pointed to opportunities which these societies even to-day could use to foster such understanding The development of communal life is indeed a step to the development of political life and understanding

Nor is this confined to the village or rural communities of Britain or Europe Perhaps the most important passage of Lord Cranbrook's address is that in which he discusses the bearing of our experience on what is happening in the under-developed countries The major scientific societies of those countries are unlikely to pass through the stage of consisting mainly of amateurs, as did the Royal Society and other learned societies in Europe in the seventeenth and eighteenth centuries They will consist mainly of professional people, and the developing schools and universities of these countries may have to concentrate on producing professional men and technicians In the immediate future medical men, veterinary surgeons, engineers, agricultural advisers and teachers are the primary need rather than research workers, but even so, it will be important that the general body of the population should understand something of the meaning and purpose of science

Since these professional scientists are likely to be preoccupied in professional practice or the training of technologists and technicians, Lord Cranbrook suggested that it will be the more important that a body of amateurs should be built up to study the natural history, archæology and local history of these countries He visualized a series of Associations for the Advancement of Science, from which these peoples can learn something of the pleasures as well as of the meaning and purpose of science, and he sees a very clear parallel between technical development and knowledge of natural history in Britain 150 years ago and in the less highly developed countries to-day It was as we passed from being a mainly agricultural to a mainly industrial community that men of all classes were busily engaged on finding, describing and cataloguing the living things around them

Lord Cranbrook thus looks to something of a renaissance of the local scientific society both in Britain and in the lesser developed countries, and in this he has the support of Sir Cyril Hinshelwood, who, in a notable address last autumn to the Manchester Literary and Philosophical Society, referred to the part which such societies could play in promoting understanding between the arts and scientists Moreover, Lord Cranbrook recognizes that something can be done to help under-developed countries on the social side also through the technical assistance which is now being increasingly given He did not refer specifically to either the British or the United States schemes for voluntary service by young people overseas, but, of the young people from Britain who are going to the under-developed countries in increasing numbers on medium-term engagements as technicians or teachers and for short periods to assist generally in social work, he emphasizes that it is important that they should all realize how Britain developed and how our experience might be useful to others

Perhaps the Voluntary Service Overseas scheme may have particular potentialities in this connexion , but for any effective assistance to be given in this way by those who proceed overseas under that scheme or any scheme of technical assistance, there is one essential condition Something more than knowledge is required—an inquiring mind and the eagerness to learn which mark the amateur and characterize the true professional are needed Unless both are nurtured and encouraged by schools and universities alike, it is idle to expect that Britain will maintain the excellence which has characterized her scientific work and much of her technology in the past, and still less that she will make the contribution to the leadership of the emergent nations in welfare or in scientific and technical development which her experience and her tradition so richly qualify her to render These two addresses at Norwich have pointed to opportunities and they have issued a challenge which should be accepted not only by the schools and the universities but also by many of the professional institutions, learned societies and the local societies in which professional and amateur have often come together and co-operated on terms of mutual respect and understanding Moreover, the same challenge was issued, but in another context, quite as clearly by the Master of Sidney Sussex College, Cambridge, Dr David Thomson, in speaking of what the universities expect from the schools Thus he referred to the subtle and imperceptible threshold between pupil and student, and the absence of evidence that everyone can reach or cross this threshold, and he urged that it is the supreme duty of a sixth-form teacher to lead his charges to this threshold and encourage them to venture beyond, independent of teacher or text-book A similar task, different only in level, confronts every teacher in further education Britain's economic and industrial future, no less than the extent to which she can rise to her opportunities of leadership, alike depend largely on the effectiveness and vision with which it is discharged

MATHEMATICAL TABLES

Table of Values of the Function

$$w(z) = \mathrm{e}^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z \mathrm{e}^{t^2}\,\mathrm{d}t\right)$$

for Complex Argument

By V N Faddeyeva and N M Terent'ev Edited by V A Fok Translated from the Russian by D G Fry (Mathematical Tables Series, Vol 11) Pp v + 280 (London and New York Pergamon Press, 1961) 100*s* net

Tables of Airy Functions and Special Confluent Hypergeometric Functions for Asymptotic Solutions of Differential Equations of the Second Order

By A D Smirnov Translated from the Russian by D G Fry (Mathematical Tables Series, Vol 7) Pp vii + 260 (London and New York Pergamon Press, 1960) 100*s* net

Bessel Functions

Part 3 Zeros and Associated Values Edited by F W J Olver Prepared under the direction of the Bessel Functions Panel of the Mathematical Tables Committee (Royal Society Mathematical Tables, Vol 7) Pp lx + 79 (Cambridge At the University Press, 1960) 50*s* net

Tables of the Riemann Zeta Function

By C B Haselgrove, in collaboration with J C P Miller (Royal Society Mathematical Tables, Vol 6) Pp xxii + 80 (Cambridge At the University Press, 1960 Published for the Royal Society) 50*s* net

Representations of Primes by Quadratic Forms

Prepared by Hansraj Gupta, M S Cheema, A Mehta and O P Gupta Edited by J C P Miller (Royal Society Mathematical Tables, Vol 5) Pp xxiv + 125 (Cambridge At the University Press, 1960) 45*s* net

ANY suggestion that the advent of electronic computers may lead to the cessation of further publication of mathematical tables is refuted by this collection of new tables The collection is particularly interesting, since the first two are of Russian origin, and allow some sort of comparison with British tables

The first volume deals with a function $w(z)$, which at first sight would appear to have little practical value But if we write $z = x + iy$, then both $w(x)$ and $w(iy)$ are simply related to integrals of exp $\pm\, t^2$, and when $x = y$, $w(z)$ is connected with integrals of the Bessel function $J_{\pm\frac{1}{4}}(t)$ The function itself may be expressed in the form

$$w(z) = \frac{i}{\pi}\int_{\infty}^{\infty} \frac{\exp - t^2\,\mathrm{d}t}{z - t}$$

It occurs in scattering theory, in the propagation of electromagnetic waves, and in the breadth of spectral lines These tables give $w(x + iy)$ for $0 \leqslant x,y \leqslant 5$, to 6 figures, with differences, and at a tabular interval of 0 1 The tables themselves are clear to read, but it is a pity that not more information is available about their checking, and the elimination of errors The publishers apologize for the 'messy' character of the introductory pages The apology is very appropriate

The second volume, by Smirnov, deals with Airy functions These functions satisfy differential equations of the form $y''(x) + x^a y(x) = 0$ They appear frequently in all sorts of numerical methods, and their tabulation in detail is very desirable This collection gives $y(x,a)$ and certain derivatives and differences, for $| x | \leqslant 6$ at intervals of 0 01, and for 16 rational values of a between $-\frac{3}{4}$ and 2 Lagrangian interpolation is possible to within 10^{-3} on average The tables are beautifully printed, and are presumably copied photographically from the Russian original The preliminary explanatory material is less attractive, and the volume is rendered less satisfying than it could be by the inclusion of some so-called "confluent hypergeometric functions", which are quite distinct from the usual function $F(a,b,x)$ of that name

The remaining three volumes are all part of the Royal Society series of mathematical tables Here we meet an element of distinction, previously missing All three introductory sections are alive, well informed and interestingly written In particular, the volume on Bessel functions—which is No 3 in the series, and follows earlier volumes in 1937 and 1952—reads like a detective story It is an intriguing sign of the influence of electronic computers that in the end, as part of the checking process, 18 years of work by desk machines was repeated in 12½ hours on the computer But zeros of transcendental functions are notoriously difficult to evaluate Here again are given the first fifty zeros of J_n, Y_n, J_n' and Y_n', together with those for the gradient of the spherical Bessel functions, for $n = 0(\frac{1}{2})20\frac{1}{2}$ The layout is good, and the methods of testing and checking are clearly stated This is a first-rate volume

With the Riemann zeta function we enter the realm of pure mathematics There is still no proof that all the non-trivial zeros of $\zeta(s)$ in the critical strip for which the real part of s lies between 0 and 1, are on the critical line bisecting this strip But this seems to be the case so far as calculations have been carried This volume gives the real and imaginary parts of $\zeta(\frac{1}{2} + it)$ and $\zeta(1 + it)$ for $t = 0$ (0 1) 1000 to 6 decimals Immense tabulation on a computer was needed But the results are worth it

Finally, we have Gupta's tables giving various representations of prime numbers p not exceeding 100,000 If $p = a^2 + Db^2$, where $D = 5$, 6, 10 or 13, the values of a and b are given (if they exist) for all p So also is the least value of k and corresponding n, where, for the same p and D, $kp = n^2 + D$ These tables are easy to read, and should give much pleasure to those mathematicians interested in the theory of quadratic fields The tests used by the authors are impressive The typing of the tables in a form suitable for direct photo-copying was admirably done on a card-controlled typewriter C A COULSON

ORIGIN OF THE NORTHERN RHODESIAN COPPER DEPOSITS

The Geology of the Northern Rhodesian Copperbelt

Edited by Dr. F. Mendelsohn. Pp. xvi + 523. (London: Macdonald and Co. (Publishers), Ltd., 1961.) 84*s* net.

IN November 1902 W. C. Collier shot a roan antelope in the bush while prospecting near the Luanshya River: close to the body of the buck he found outcrops carrying copper and pegged a claim. Twenty-nine years later Roan Antelope became the first of the great Northern Rhodesian copper mines to come into production. To-day the Copperbelt supports a community of more than a quarter of a million and produces nearly one-fifth of the free world's copper.

Something of the scientific effort behind this great expansion is revealed by the twenty-three authors of the monograph under review. The majority are members of the geological staffs of the Anglo-American Corporation and Rhodesian Selection Trust, but there are also contributors from the British South Africa Company and Union Minière du Haut-Katanga. Since the ore deposits on the Copperbelt are almost wholly confined to a series of sediments of presumed Pre-Cambrian age, the Lower Roan Group of the Katanga System, the first necessity for exploration was a geological map showing the extent of these rocks. Its production was aided by aerial photography, and the recognition of individual deposits has been facilitated by a variety of geophysical and geochemical prospecting techniques.

Economic mineralization on the Copperbelt is concentrated in a zone about 100 miles long and up to 40 miles across. This is, however, but a fraction of the 500-mile arc of folded Katanga beds which stretches through Northern Rhodesia and the Congo into Angola, covering more than 80,000 square miles and forming one of the world's greatest base-metal provinces. Structurally, the Copperbelt is dominated by the north-west trending Kafue anticline, which brings up a central belt of pre-Katanga rocks and is flanked to the north-east by the Mufulira syncline and to the south-west by a series of *en echelon* downfolds on the flanks of which Bancroft, Nchanga, Chibuluma, Nkana and Roan Antelope Mines are situated. The ore-bodies occur in rock of varying lithology: in the Mufulira basin they are predominantly arenaceous, to the south-west more commonly argillaceous.

Lively controversy has surrounded the origin of the ores. On one hand their great lateral extent, their persistence at certain stratigraphical horizons, their intimate connexion with sedimentary features of the host rocks, the inferred relation of sulphide zoning to facies, the evidence that much of the mineralization is pre-folding, the absence of any obvious deep-seated source for the mineralizing solutions and the difficulty of envisaging movement of large volumes of such solutions for great distances through sediments of low permeability have suggested a sedimentary syngenetic origin. Lean copper deposits known to occur in the Pre-Katanga rocks have, it is suggested, been eroded, transported in solution to the basin of deposition and precipitated during the sedimentation of the Lower Roan Group. Subsequent redistribution has taken place during the folding and metamorphism of the sediments. On the other hand, there are many features more readily explained in terms of epigenetic hypogene mineralization. These include the relation of the deposits to the central region of the Katanga geosyncline and to fold axes, the presence of local mineralization in Pre-Katanga rocks immediately beneath ore-bodies in the Lower Roan Group, the geochemistry of the sediments, suggesting that they have undergone widespread metasomatism, and the inadequacy of the metamorphic temperatures capable of producing rocks of the greenschist facies to account for certain observed mineralogical features.

In many cases the evidence recorded from different mines is conflicting. At Roan Antelope ore has been proved over a strike length of about 7 miles and to a depth of nearly 4,000 ft. in a stratigraphically controlled ore-body with an average thickness of 25 ft.: at Nchanga it transgresses stratigraphical boundaries through more than 300 ft. of varied sediments. At Chibuluma and Roan Antelope the mineralization is unrelated to the folding: at Nkana South the ore-body is confined to the highly contorted and fissile portions of carbonaceous shales. At Mufulira mineralization is regarded as pre-dating slumping: at Mindola it appears to post-date faulting. It is scarcely to be wondered at that the various contributors fail to reach agreement as to the genesis of the ores, though more space is devoted to the sedimentary syngenetic theory than to any other. It is perhaps more surprising that no attempt is made to reconcile the puzzling association of criteria suggesting both syngenesis and epigenesis in some mechanism such as long-continued infiltration of ascending solutions into the basin of deposition as well as into the growing pile of sediments.

Supergene alteration persists to great depths on the Copperbelt, and some of the conflicting evidence may be a consequence of failure to recognize the full extent of secondary sulphide enrichment. More detailed investigation of this problem is evidently needed. Equally essential is the study of the relation of mineralization to both sedimentary and tectonic features in the base metal province of the Katanga geosyncline as a whole rather than in the small portion of it which forms the Copperbelt. Political factors, unfortunately, make this a more difficult task to-day than at any time in the past fifty years. When it can be undertaken it should prove both scientifically rewarding and commercially profitable.

J. H. Taylor

SCIENCE IN POETRY AND VERSE

A Book of Science Verse

The Poetic Relations of Science and Technology. Selected by W. Eastwood. Pp. xvi + 279. (London: Macmillan and Co., Ltd., 1961.) 21*s* net.

THIS is a pleasant and successful anthology of the treatment of 'science'—the term is given a wide construction—in poetry and in verse. Mr. Eastwood, who is vice-principal of Reading Technical College, starts on an optimistic note. He points out in his introduction that "the separation of science and poetry does not go back much further than the late eighteenth century", that "poet and scientist are alike concerned with the ordering of experience, and to both the imagination is important" . . . "a poetry which ignores science and its applications is, in the modern world, divorced from life" . . . "There is no future for a culture which cannot reconcile the poetic and scientific impulses, for both are necessary to the human spirit'' These statements, apparently so simple, do in fact raise issues of vast importance, an appendix of selected pronouncements by Wordsworth, Peacock, Herbert Spencer, A N Whitehead, I A Richards and C Day Lewis provides material for further argument But the greatest difficulty of all goes unsolved the basic and ever-increasing difference in the vocabularies of scientists and poets John Donne could use astronomy, alchemy, metallurgy, optics and a little geometry, because knowledge had not yet given them a specialized diction A glance at technical glossaries—say, of computers or guided missiles—offers little hope for their use in metrical structures.

Among the poems, or parts of them, that we should have expected are those from Lucretius, Chaucer, Shakespeare, Donne, Milton, Butler of *Hudibras*, Akenside, Erasmus Darwin, Wordsworth, Shelley, Tennyson, Kipling, but Mr Eastwood has cast his net far more widely, and with effect It is improbable, for example, that the common reader will know Blackmoor's *Anatomy and Revelation*, Young (dullest of poets) on *Scientific Theology and Religious Naturalism*, Hood's *Craniology* He will find an extract from Blake's *Vala* and perhaps regret that he does not find more passages from, let us say, *Jerusalem*

But it is in the poetry of our own century, and in particular of the past twenty years, that Mr Eastwood's harvest is richest, Hart Crane's admirable *The Bridge*, Kathleen Raine's *The Human Form Divine* and *Rock*, Patrick Dickinson's *Jodrell Bank*, Robert Conquest's *Guided Missile Experimental Range*, John Wain's *Poem Feign'd to have been by an Electronic Brain*, and much else A reviewer is prompted, inevitably, to speculate on what he himself might have added or omitted 'Q's parody of Sir Patrick Spens is good only in parts Surely there was a case for including W J Turner's *Geological*, perhaps his *Formal Lyric*, Wilfred Ashley's *Goods Train at Night* possibly the magnificent epitaph in terms of the railway that rests in the south transept of Ely Cathedral And while we have a poem on a tractor—there must be many written in the Soviet Union, too—why have we no poem on motor-cars?

A NEW LOOK IN PHYSICS TEXT-BOOKS

Physics

(Physical Science Study Committee) Pp viii+656 40s Laboratory Guide for Physics Pp vii+87 10s (Boston, Mass D C Heath and Company, London George G Harrap and Co , Ltd , 1960)

THIS book represents a new kind of physics course It is a year's work intended for American high-school pupils aged about 16 years, who may have done no physics previously and who need not necessarily be doing mathematics concurrently It is excellent by any standards, authoritative, well planned, clearly written, and in this final (or more probably, current) edition, which is the outcome of drafts already tested in schools, well produced It is unlikely, at least in the near future, that many British teachers will find themselves using such a course, but this is a book which every physics teacher ought to read He will find it stimulating and instructive, it will also possibly provoke some disagreement—and it is about time that teachers in Britain had something as provocative as this to shake up their ideas

The Physical Science Study Committee in the United States has organized this course down to the finest detail, covering text-book, laboratory guide, apparatus, films, tests, and background reading, and also the teacher who is, as Prof Zacharias has said, only one of the range of teaching aids Indeed, experienced teachers are being re-trained on full-time courses lasting about a term to prepare themselves to work this syllabus This almost savours of 'The Method', but both British and American physicists who have been to these courses assure me that after a short initial phase of scepticism they have been imbued with the ideas of the Physical Science Study Committee It should also allay the misgivings of those who feel that the concepts of modern physics can only be presented to schoolboys in a dogmatic manner, which is the chief basis for any disagreement with the Committee's course, for it is intended to be taught by people who have been converted to the belief that it can be done soundly, scientifically, and as undogmatically as anything can be done at school—and who understand how

The text-book is in four parts, each the work of a group composed of university physicists and school-teachers The first part deals with the measurement of time and distance, motion, vectors, the concept of mass, elements, atoms and molecules Part 2, on optics and waves, explains wave propagation very fully, and gives a detailed treatment of interference and diffraction, it also discusses the particle behaviour of light Part 3, on Newtonian mechanics and gravitation, deserves a very careful study by those who are suspicious of dogma Newton's third law (which, incidentally, is not called that) is obtained inductively (as Newton found it) from experimental observations on the conservation of momentum The really honest reader will find himself wondering whether he has not been teaching dogmatically for years Part 4, on electricity and atomic structure, is written in rationalized M K S units, sooner or later science teachers in Britain will have to be as adaptable as teachers in other countries who must have undergone the discipline of mastering them on the job recently But the work on electromagnetism is made crisper than usual by the elimination of the vector H It is possible that the treatment may be revised in places Great emphasis is laid, for example, on Millikan's experiment for e, performed with small plastic spheres This has been criticized as taking a lot for granted, and I believe the Committee was rather worried about its soundness, but the latest report on it was reassuring Atomic structure is dealt with entirely in terms of energy-levels, the existence of stationary states being justified by an appeal to elementary wave-mechanics The Bohr atom itself, which looks as if it may at last be finding its way into British school syllabuses, has been dispensed with in this book

Many of the experiments in the laboratory manual are to be commended as they show what can be done with quite simple apparatus These include the determination of molecular size, the examination of spectra and the determination of wave-length, the relation between inertia-mass, gravitational-mass and weight, the verification of Kepler's law of equal areas, and the determination of the mass of the electron

Heat, as it is usually taught, does not come into the course at all, and, in what is intended for a one-year course, the compilers have had to be rigorously selective in other directions as well They have concentrated on what they believe to be fundamental and what can be well taught They report that the course has proved itself in practice, and the tests given to the pupils are certainly exacting I was able to obtain a specimen set, and I can only say that I should not care to tackle them after a hard day spent determining coefficients of expansion

Prof Francis L Friedman, of the Massachusetts Institute of Technology, describes the development of the text-book in an appendix, and lists the 200 or so contributors to the programme They must be proud of their achievement G R NOAKES

MATERIALS FOR REACTORS

Reactor Handbook, Vol 1

Materials Edited by C R Tipton, Jr Second edition, revised and enlarged Pp xv+1207 (New York Interscience Publishers, Inc , London Interscience Publishers, Ltd , 1960) 260*s*

THE first edition of this handbook was published by the United States Atomic Energy Commission before the 1958 Geneva Conference, at a time when little atomic energy information had been released It is not surprising, therefore, that considerable expansion and revision of the data have been necessary in such a rapidly expanding field and with the declassification of much of the earlier material In particular, both liquid and gaseous reactor materials have now been included and the number of authors contributing extended to some 130 reactor specialists The majority of the data has been drawn from U S Atomic Energy Commission reports, many of which are still classified, with generally only brief mention of British and other European work It is claimed that the subject-matter is current to about the spring of 1958, which would suggest that little of the information released at the 1958 Geneva Conference is included

It is only possible to indicate briefly the scope of a volume of 1,200 pages which covers a wide range of materials In a general introductory section, brief surveys are made of radiation damage and of the health and safety aspects involved in handling the special materials in the nuclear energy industry About a third of the book is devoted to the production and properties of fuels, which include those based on uranium, plutonium and thorium metals both in solid and liquid form and as ceramics, aqueous solutions and molten salts A most comprehensive list of canning and control materials is considered and the moderators reviewed are hydrogen-containing compounds, graphite and beryllium-base materials of interest The properties of both gaseous and liquid metal coolants are detailed together with compatibility data relevant to reactor operation A section on shielding materials covers their physical and mechanical properties and behaviour under irradiation The volume concludes with a selected list of references dealing with the constitution of various binary alloys, which is in addition to a large number of equilibrium diagrams of technological interest distributed throughout the text

Certain aspects of reactor technology of somewhat limited interest are described in considerable detail, whereas other problems, the elucidation of which has occupied a great deal of effort, are not dealt with adequately For example, swelling of uranium metal fuels which can severely restrict their life under certain operating conditions, is barely mentioned and the section on radiation damage in beryllium could justifiably be expanded This also applies to the problems associated with pressure vessel steels, which could be considered in much greater detail The section on magnesium alloys only briefly mentions the magnox series which were developed by British workers and adopted as the canning material for the first seven Central Electricity Generating Board nuclear power stations and ignores the zirconium-bearing *ZA* alloy which the French have developed successfully for their reactors One is left with the impression that the handbook was prepared to satisfy the interests of United States reactor technologists up to 1958 rather than to present a more comprehensive and general survey of reactor materials Nevertheless, it is a valuable reference book and contains a wealth of useful information

ENZYMES AND CANCER

Chemistry of Enzymes in Cancer

By Prof Franz Bergel (A Monograph in American Lectures in Living Chemistry) Pp xi+122 (Springfield, Ill Charles C Thomas, Oxford Blackwell Scientic Publications, 1961) 44*s*

THIRTY years ago biochemists were hopefully seeking for qualitative differences in metabolism between normal and tumour cells which might explain their radically different biological behaviour That search is presumably over, and we are left with only a few quantitative differences, most of them of dubious relevance to the problem of the causation of cancer

Prof Bergel starts from the working hypothesis that these differences, which are the outward signs of changes in the deoxyribonucleic acid constitution of the cells, are related to the abnormal properties of cancer cells, and that if the metabolic differences could, by any therapeutic means, be removed, then the cells would revert to normal behaviour

In Part 1 he outlines the three major kinds of hypothesis which attempt to relate enzymes to cancer (1) the 'faulty' respiration theory of Warburg, (2) the generalization of Greenberg that all tumours possess a similar enzymic constitution, (3) the 'deletion' theory, due chiefly to Potter, according to which the cancer cell has lost certain protein constituents, probably concerned in the synthesis of enzymes, and he criticizes each in the light of recent biochemical developments There follows a detailed discussion of the present state of knowledge with respect to certain selected groups of enzyme systems, namely, those concerned with nucleic acid catabolism, which are deficient in tumours, those concerned with protein and amino-acid catabolism, which are deficient at least in some tumours, and the enzymes of carbohydrate breakdown, where, among many other differences, phosphorylase is deficient All these changes are in the direction of providing an increased potential for cell division

Part 2 deals with the possibilities of acting on tumour cells *in vivo* in such a way as to correct the faults in their metabolism and restore them to normality The final chapter gives several examples in detail, the emphasis being on 'restitution' therapy, in which enzymes deficient in the tumour are injected into the animal and effects observed on the rate of growth of the tumour Cessation of growth has been observed as a result of injection of both xanthine oxidase and ribonuclease

This is not a book for the general reader, it assumes a biochemical background, and an intimate knowledge of a vast literature Prof Bergel almost accepts (p 81) that the fundamental difference between normal and cancer cells must lie in the chemistry of their deoxyribonucleic acids (DNA), and that the changes in enzyme concentration which are observed must necessarily result from this change in the DNA, through mechanisms the study of which is still in its infancy It follows that attempts to correct enzyme imbalance by 'restitution' therapy cannot restore cancer cells to normality, though its continued application could conceivably control their harmful activities The attempt to "repair biochemical lesions residing in the DNA" (p 82) lies far in the future Enzyme therapy obviously depends on the possibility of introducing macromolecules into cells The only mechanism so far suggested for this process is pinocytosis (the engulfing of small quantities of extra-cellular fluid by cells), a phenomenon about which little is known with certainty, Prof Bergel agrees that it is "still a subject of speculation and research" (p 58)

The subject-matter is presented with exemplary clarity, and the book excellently produced and well indexed It will obviously be read with the greatest interest by all those concerned in cancer research

L H STICKLAND

PHYSICAL OCEANOGRAPHY

Physical Oceanography

By Prof Albert Defant Vol 1 pp xvi+729 Vol 2 pp viii+598 (London and New York Pergamon Press, 1961) £10 10*s* per set of two volumes

IN these two volumes Prof Defant has attempted the seemingly impossible task of covering single-handed the whole field of physical oceanography That he has succeeded with such thoroughness and in such minute detail reflects the wide range of his lifetime's work in this subject In almost every chapter, references are found to significant original contributions by Prof Defant himself, and the text is often illuminated with examples drawn from the results of the *Meteor* expedition of 1925–27, in which he took part

Each volume is in two parts , the first part of Vol 1 deals with the properties of sea-water and related topics Following a brief chapter on the dimensions of the oceans and the topography of the sea-floor, the next five chapters, occupying some 200 pages, deal with the physical and chemical properties of sea-water, the distribution of temperature, salinity and density in the ocean and their variation with time, and the temperature–salinity relationship and its connexion with mixing processes These are followed by two chapters on the water budget of the Earth, and ice in the sea

The second part of Vol 1 is devoted to dynamical oceanography, the movement of sea-water in the form of ocean currents After considering the forces acting on the water, and the basic hydrodynamic equations, the theory of currents in homogeneous water is developed This is followed by a discussion of the conditions at the boundary surfaces of water masses, and of currents in a non-homogeneous ocean Special consideration is given to currents in straits, and after a brief discussion of the effect of wind on the mass distribution and density currents, the remainder of the volume, amounting to 150 pages, is devoted to an account of the general circulation of the oceans

In Vol 2, Prof Defant is concerned with periodic movements in the ocean The first part deals with the theory of surface waves, methods for their measurement and analysis, and theories of their growth and propagation Waves in shallow water and near coasts, long waves in canals and standing waves in enclosed basins are also considered The second part of this volume is an account of the tides and tidal currents The tide-generating forces, the theory of tides, and the methods of harmonic analysis of tidal observations are described first, followed by a detailed account of the tides in the Mediterranean and the shallow seas Tides in estuaries are next dealt with, then follows an account of tides in the deep oceans, particularly in the Atlantic There is a chapter on Earth tides and the effect of friction due to tidal currents, and the volume is concluded with a substantial chapter of 50 pages on internal waves

The manuscript of this book was completed in 1945, but post-War difficulties prevented its publication until 1961 Several revisions had been made by then, and also the text had been translated from German to English Inevitably there is some unevenness in the revision , some topics have been brought up to date as far as 1957, others have been relatively neglected The claim in the preface that "the oceanographic literature has been considered in its entirety to the end of May 1957" seems exaggerated The first chapter on the structure of the sea-floor is out of date, and post-War revisions have left some confusion Three different values are quoted for the maximum depth in the Pacific Much recent work on the topography of the North Atlantic, and the geophysical structure of the Earth's crust beneath the oceans and continents could have been included In the chapter on properties of sea-water, no mention is made of its electrical conductivity, the precise measurement of which is used extensively nowadays as a substitute for salinity determination Post-War work in the United States on forecasting ice conditions is not referred to in the chapter "Ice in the Sea" Recent measurements of radiocarbon concentration in sea-water and its implications in estimating the time-scale of the deep circulation are not considered, and much more recent work on the generation and propagation of surface waves could have been mentioned Besides this lack of uniformity in up-to-date revision, the text is marred by a number of misprints, especially in authors' names But Prof Defant disarms criticism with his quotation from Newton, that these volumes "may be read with forbearance, not so much with the view to censure, as to remedy their defects" , and indeed these errors and omissions seem minor in comparison with the vast quantity of information presented here

Physical oceanographers may consider themselves fortunate to have so much of Prof Defant's knowledge and experience made available to them in these volumes, even at the price of ten guineas

J C SWALLOW

Priests and People

A Study in the Sociology of Religion By Conor K Ward (Social Research Series) Pp xi+182 (Liverpool Liverpool University Press, 1961) 25*s.* net

THIS book is the fruit of fifteen months field work by a team of sociologists in a Roman Catholic parish in Liverpool It provides, therefore, a very thorough examination of the life and activities of the parish and makes available much material which can be used in assessing the effectiveness of a parish in an urban setting This is perhaps where the chief interest of the book lies for the general reader For more than a thousand years the territorial parish with its church and resident clergy has been the normal centre of Christian life and in the past it developed into very much more than a centre for worship only Around the parish church was collected the educational, social and sometimes political life of the area But with the coming of the Industrial Revolution all this was changed and the parish ceased to be the centre it had been

The question has been raised whether the system of territorial parishes is the most effective expression of Christian community in an industrial society Ought the Church not to be training its man-power for specialist ministries, industrial chaplaincies, etc , rather than for parochial work ? Such questions are constantly being argued and strong opinions are expressed Dr Ward's book makes it abundantly clear that more sociological research is a first essential for finding effective answers for these and other problems It would be dangerous to make generalizations from this study of one parish Few parishes will be as socially monochrome as this one was Studies of other parishes would be useful to test how far the situation here described is typical One suspects that the social cohesion of Liverpool with its history of religious intolerance might not be so true of parishes in other parts of Britain Yet Dr Ward has made one thing clear Though changes must be made to adapt the parish more effectively to its urban environment, it will not be superseded in the foreseeable future J ROBINSON

Handbuch der Astronautik, Lieferung 1–6

Herausgegeben von Prof Karl Schutte und Hans K Kaiser Band 1, Heft 1 Pp 1–32 Band 1, Heft 2 Pp 33–64 Band 1, Heft 3 Pp 65–96 Band 1, Heft 4 Pp. 97–128 Band 1, Heft 5 Pp 129–160 Band 1, Heft 6 Pp. 161–192 (Konstanz Akademische Verlagsgesellschaft Athenaion, Dr Albert Hachfeld, 1958 und 1960) 1 50 dollars each part

THIS *Handbook of Astronautics* will consist of 4 volumes, each made up of about 12 sections, the individual sections being issued separately and each containing 32 pages Of the proposed 48 sections it is the first 6 which are the subjects of this review There is no editorial introduction to explain the aims or scope of the *Handbook*, but the intention appears to be to cover the whole subject of astronautics, from the details of rocket engines to the niceties of space law, in a series of articles of about 20 pages each, which begin from first principles and presumably in later issues will go into the subjects more fully The issues under review contain 8½ articles Willy Ley writes on the history of the idea of space flight, W Schaub on "Gravity and Its Conquest", dealing with the fundamental dynamics, J. C Cooper on "Flight-space Law", and A. J Zaehringer on solid-propellant rockets H Stumke describes how to calculate the flight performance of unmanned rockets in considerable detail, S J Smith and G P Sutton review heat-transfer problems in liquid-propellant rocket motors, R P Haviland outlines the applications of satellite vehicles, and J Eugster investigates the dangers to space travellers from cosmic rays and other radiations Finally W Alveimann and W Lohse begin to discuss the theory of rocket engines, but suffer a premature cut-off in mid-sentence These articles form sound and useful introductions to their subjects, and the *Handbook* as a whole promises to be valuable as a work of reference and for teaching purposes, though it remains to be seen whether the choice of subjects for articles will be well balanced The book follows the unsatisfactory dual-language convention, with about half the articles in English and half in German Since most readers are not equally fluent in both languages, the value of the book is, for them, halved The separate sections have attractive paper covers, but are presumably intended to be bound together, since they are apt to finish in mid-sentence, so the total cost of the 1,500-page *Handbook* will be 72 dollars plus binding costs D G KING-HELE

A Statistical Model for Chemists

By Edward L Bauer Pp x+156. (New York Academic Press, Inc , London Academic Press, Inc (London), Ltd , 1960.) 4 75 dollars.

THE author in his preface describes this book as "a manual for the working chemist" and no more exact definition of this excellent little handbook could possibly be given Shorn of all complicated mathematical functions and lucid in its approach, this volume supplies the chemist with typical examples taken from ordinary laboratory data, and indicates those benefits relating to economy, accuracy and interpretation which can accrue from applications of the statistical method

The relation of the Gaussian normal distribution curve to the 'Student's t' concept of Gosset is clearly described, the latter function being of most general use to the chemist, who is usually concerned with the averages of small sample results

Conventional statistical terms such as precision, accuracy, average deviation, variance, standard deviation, etc , are all concisely defined. Fixed, random and mixed models of the analysis of variance technique are illustrated by reference to three chemists carrying out certain analytical observations Most of the tests of significance used in the book are based on the analysis of variance method, but attention is directed to the simplifications resulting from the use of range rather than variance in the calculations Chapter 6 contains an interesting exposition of regression analysis involving correlated variables, and is illustrated by the effects of unknown 'blank' titres, etc , in quantitative analyses. Theories of sampling, control of routine analyses and factorial experimentation are all given fairly full treatment

The volume ends with a collection of useful statistical tables, for example, for use with F and t functions, computation of confidence limits, etc.

This book should prove a most useful elementary introduction to the amateur statistician, particularly in the chemical field D. T LEWIS

ARSENIC CONTENT OF NAPOLEON I's HAIR PROBABLY TAKEN IMMEDIATELY AFTER HIS DEATH

By Dr STEN FORSHUFVUD, Dr. HAMILTON SMITH and Dr. ANDERS WASSÉN

Vasagatan 33, Goteborg C, Sweden, and Department of Forensic Medicine,
The University, Glasgow, W 2

IT has generally been deduced from the report of the post-mortem dissection dated St Helena, May 6, 1821, and signed by the British medical officers, Thomas Shortt, Archibald Arnott, Charles Mitchell, Francis Burton and Matthew Livingstone, that Napoleon I's death the preceding day was due to extensive cancerous lesions of the stomach

The view that Napoleon died of 'cancer' was not accepted by Francesco Antommarchi, the man who actually performed the autopsy, who had been Napoleon's household physician for the last twenty months, and was the only physician on St Helena with a pathologist's training He maintained that the hepatitis the Emperor had suffered from for a long time was the cause of death Furthermore, the Emperor's enlarged, tender liver, jaundiced complexion and yellow conjunctivæ had also been diagnosed as signs of severe hepatitis by Barry O'Meara, Napoleon's household physician during his first three years in exile, and John Stokoe, who had attended Napoleon for a week in January 1819

Consequently, apart from Dr Arnott, who assisted Antommarchi during the last few weeks when the morbid picture was especially baffling, those medical men who personally had attended Napoleon during his illness refused to admit that he had died from cancer

Many medical writers with doubts about the cancer diagnosis have attempted to identify Napoleon's disease on St Helena by analysing compilations of his signs and symptoms This has produced surprisingly disparate results Thus, when exiled on St Helena, Napoleon is alleged to have had, or suffered from the sequels of, the following diseases peptic ulcer, intestinal ulceration, various liver inflammations, undulant fever, malaria, dysentery, rheumatoid arthritis, heart failure, congenital extremely slow blood circulation, epilepsy, tuberculosis, pleurisy, severe hormonal imbalance leading to obesity and impotence (dystrophia adiposogenitalis), syphilis, gonorrhœa, intoxication from defective teeth (so-called focal infection), gout, piles, and a constitutional predisposition to severe constipation which, it is said, was fatal owing to auto-intoxication and poisoning by laxatives

If a suitable selection is made from the variety of signs and symptoms manifested by Napoleon on St Helena, it is a simple matter to make out a convincing case for every one of these diagnoses in turn But if what, after all, was a fairly unchanging disease pattern on St Helena is taken as an entity, and allowance is made for all the signs and symptoms and their interrelations, then one cannot escape the impression that all the pieces form an orderly picture of two highly characteristic syndromes, namely, the chronic and acute types of arsenic poisoning

Napoleon's condition was rather poor during the Hundred Days However, his health improved while he was being taken into exile on board H M S *Northumberland*, and Napoleon's general health remained good during the initial period on St Helena when, with his sole companions and collaborators, the Chamberlain Las Cases and his son, he lived in a simple cottage on the estate, 'The Briars'

Soon after moving to 'Longwood', which became his permanent residence, Napoleon's ailments again became manifest He turned moody, had various aches and pains, the lower legs swelled up and would not carry him, exanthemata broke out, particularly on the legs, his sleep was abnormal with either insomnia or somnolence diarrhœa and constipation alternated, headaches occurred with increasing frequency and severity

His indispositions at first lasted only a few days at a time, his mental powers returning undiminished in the intervals Nevertheless, members of his staff noticed marked changes in his expression and increasing difficulties in locomotion Napoleon's legs were swollen and often collapsed under him

On May 1, 1816, Napoleon had an attack lasting for a whole week Las Cases mentions that he complained of weak legs, headache, hypersensitivity to light, and felt cold and shivery, his facial expression had changed markedly, he spoke sluggishly, and was morose and taciturn Napoleon believed himself to have gout, suggesting that his feet were swollen and painful Though Napoleon's teeth were perfectly sound, O'Meara recorded on June 16, 1816, that his patient had toothache Later it turned out that the toothache was due to 'scurvy', that is, stomatitis On July 26, 1816, Napoleon experienced the first stab of that pain in the hypochondrium which was a constant source of distress through the rest of his life After a number of brief attacks of malaise, Napoleon fell ill for six weeks in succession on October 1, 1816 A troublesome cough was now added to the list of symptoms, he had pustules on the lips as well as in the oral cavity and throat. Napoleon was tormented by an insatiable thirst and had become perceptibly hard of hearing Lassitude alternating with restlessness was a characteristic feature He always felt cold and liked to sit near the fireplace He could scarcely walk, because the swollen and weak legs would not carry him The gums swelled up and the teeth became loose Diffuse nausea with a predisposition for spasmodic vomiting without actual regurgitation of food were also noted Napoleon had a relapse with the same manifestations as before on December 3 and 4, 1816, and his companions now became aware of his very jaundiced complexion On December 14, 18 and 28 there were further attacks the symptoms of which included spastic involuntary movements and unconsciousness on several occasions According to the head valet Marchand, one of these bouts was combined with dysentery (that is, severe diarrhœa) For the first time in two months Napoleon went out of doors on January 26, 1817 Apart from brief indispositions in May June and July, Napoleon's health seemed to remain comparatively good until September 25, 1817, when a period of illness set in which lasted approximately a whole year The signs and symptoms were on the whole the same as before, but new features had been added For example, in Dr O'Meara's case notes for October 1817, we read on the third a swelling was palpable on the right side near the liver, on the ninth the pains in the legs and neighbourhood of the liver had increased and pains in the shoulder supervened, on the eleventh the patient was seriously distressed by tachycardia Afterwards severe constipation developed, the skin and conjunctivæ were yellow and the appetite was poor The vomiting tendency was now accompanied by stomach-ache The stomatitis was very distressing and on several occasions caused the cheeks to swell Constant phenomena were 'febrile attacks' at nightfall and profuse sweating at daybreak The tongue was coated, the pulse often very rapid and irregular

Although Napoleon now had no physician in attendance—the British authorities had ordered O'Meara away from 'Longwood' on July 25, 1818—his health underwent a gradual improvement in the latter half of that year Some symptoms nevertheless persisted for another few months, such as lancinating hypochondrial pains and painful and weak legs Often the feet were ice cold and had to be warmed with hot towels, and the ex-Emperor frequently sat before the fire with his feet in a flannel bag

In the final months of 1818 it seemed as though Napoleon was well on the way towards full recovery Once more he began to take interest in his literary work and in his garden He started taking regular exercise, a sign that his legs would support him again In the beginning of November 1818 Bertrand, le Grand-Marechal du Palais, wrote in his diary· "   le malheur a passé sur son caractère, comme sur un roc, sans l'abattre et sans y laisser de traces"

But Napoleon again became seriously ill towards the end of December 1818 The manifestations included tachycardia, chills, fever, and the old trouble from the legs In the night between January 16 and 17, 1819, his life was threatened, he lost consciousness several times, and Dr Stokoe was summoned (He had been asked to become the Emperor's household physician the week before) In his bulletins, Stokoe stated that he had found the patient in a state of extreme exhaustion, his complexion was yellow and he had pains in the region of the liver and in the shoulder There was excruciating headache, vertigo and fainting fits Some improvement took place when the patient began to sweat profusely Similar attacks recurred the next night and the next night but one Stokoe issued three bulletins about Napoleon's health, and these so displeased the Governor, Sir Hudson Lowe, that Stokoe was constrained to leave St Helena So on January 22, 1819, Napoleon again found himself without a physician His health nevertheless improved and in the latter half of 1819 he was busily at work every morning from 4 a m to 10 a m supervising the extensive landscaping projects he was undertaking in his garden He could now walk with a stick, had recovered his former good temper, and conversed pleasantly and cheerfully with his companions Apart from a few brief indispositions, this state of good health lasted for fifteen months

However, a new long period of uninterrupted ill-health commenced on September 18, 1820 This period was marked by at least six intercurrent attacks of violent illness with severe and acute symptoms, but during the intervals of remission Napoleon's health improved day by day even though some of the symptoms persisted During these periods of convalescence he could be up and about and also, albeit with tottering steps, go for short strolls in the garden

According to Dr Antommarchi's case notes, the acute attacks were accompanied by the following symptoms headache, dyspnœa, weak, rapid and irregular pulse, ice-cold feet and legs, gastric pains, loss of appetite; somnolence that seemed refractory to treatment, yellow conjunctivæ, yellow complexion, excessive paleness, dark rings under the eyes, coated tongue, burning thirst, tachycardia, tremor, nervous dry cough, vertigo, vomiting, sensation of heat in the viscera, pain in the legs and from the liver, sternum and shoulder regions, constipation and diarrhœa, spasmodic contractions of triceps, remarkably weak legs, restlessness, nightmares, exanthemata, loose teeth, bleeding gums, insomnia, hardness of hearing, extreme hypersensitivity to light, impaired vision, very severe general exhaustion

On March 22, 1821, Napoleon's disease changed character, with constant severe vomiting supervening This was doubtless because he had been prescribed and—without knowing it—taken tartar emetic Accordingly, antimony poisoning was now an added complication A remission lasting for two and a half weeks occurred in the beginning of April 1821, and Napoleon took this opportunity to write his last will and testament

Late at night on April 24, 1821, there was a severe relapse with typical manifestations of acute antimony poisoning Additional relapses occurred over the next few days However, a moderate improvement seems to have taken place on May 3 In the afternoon of that day Napoleon unknowingly took a large dose of calomel Thirty minutes before midnight he had copious stools with the appearance of tar Additional evacuations of blood occurred on May 4 He died on May 5, 1821, after lying absolutely motionless for approximately 24 hr

At the post-mortem examination the stomach was full of black blood and the gastric mucosa was very badly corroded These findings were probably sequels of the calomel given on May 3 rather than of arsenic On the other hand, the following signs of arsenic poisoning were encountered enlarged and hardened liver, enlarged spleen, fluid effusions in the pleuræ, bronchial and mediastinal lymph nodes degenerated and in suppuration, loss of all body hair, large fat deposits under the skin and in the abdomen

Napoleon was not embalmed Yet, when his coffin was opened in 1840, those present were astonished at finding him extremely well preserved

In the light of the foregoing, it seems that on St Helena Napoleon suffered from chronic arsenic poisoning with intervening periods of acute arsenic poisoning In such circumstances, we deemed it interesting to apply the activation technique in a study of Napoleon's hairs from the period on St

Helena Through the courtesy of M le Commandant Henry Lachouque, the great French expert on Napoleon's life and the organizer of the permanent Napoleonic exhibitions on St Helena and in the French Army Museum, hair taken from Emperor Napoleon I's head, probably on the day after his death, has been made available to us

The hair sample thus obtained was sent to the Department of Forensic Medicine at the University of Glasgow, where it was examined using an activation analysis technique (Smith, 1959) as follows

The hair sample was weighed (1 72 mgm) and sealed in a polythene container It and a standard arsenic solution sealed in a silica ampoule were irradiated by thermal neutrons for one day at 10^{12} neutrons/cm^2/sec in a nuclear reactor at the Atomic Energy Research Establishment. Harwell Thereafter the sample was returned and the arsenic extracted with added carrier arsenic by a modified Gutzeit technique The activity from the hair sample was compared with that from the standard arsenic sample and the arsenic content of the hair was calculated

The value found for the sample of hair was 10 38 parts per million This is high by comparison with the normal mean arsenic content of about 0 8 p p m Unfortunately, it was not possible to make any distribution studies as no further hair samples were available It is impossible to tell from the value alone whether the arsenic was evenly distributed (as expected in continuous exposure) or located in one point (as would be the case in a single large exposure)

This investigation shows the great advantage of activation analysis when only very small quantities of sample are available

TEACHING MACHINES

So many members were interested in the symposium on "Teaching Machines" in Section J (Psychology) at the British Association meeting at Norwich on September 4 that the 'house-full' notice had to be used Introducing the subject, the chairman, Prof H Kay, pointed out the theoretical and practical implications of teaching machines It is likely that their use in research will contribute considerably to our understanding of learning processes Psychologists recognize that hitherto they have carried out extensive experiments on animal behaviour but have neglected the study of human learning Here is a definite opportunity to examine in ideally controlled conditions the variables which are influencing learning On the practical side there is not only a desperate national need for teachers, particularly in science subjects, but also an increasing problem of how to impart technological information on a world-wide scale The urgent need is for new forms of communication, teaching machines represent one such form

Dr J Annett, of the Department of Psychology, University of Sheffield, outlined the main requirements for a teaching machine It is a device not only for imparting information but also for sensing that this information has been received and understood It is a two-way communication channel designed at every stage to check the progress of the student and, ideally, to modify its instructions on the basis of the students' responses This may be achieved by several methods Perhaps the simplest is the small step or linear-type programming developed by Prof Skinner at Harvard, where a series of statements and questions are built up and are repeatedly modified on the basis of the actual success of students in mastering them Eventually a sequence is established so that when this programme is presented to other students nearly all the problems of subject-matter presentation have been anticipated Such a programme is time-consuming to prepare, is lengthy in so far as there are many items with short steps between them, but is efficient and requires little use of 'gadgets' for presentation

An alternative system is known as intrinsic programming Here there is a main line of communication, and provided a student can respond correctly he can proceed smoothly along this route But if he makes a mistake he is directed to a branch line, where further explanations are given before returning him to the main sequence Dr Annett explained that in the type of machine constructed at the Department at Sheffield this system had been achieved by a sequence of '*A*' frames and '*B*' frames If any one of the '*A*' frames is misunderstood, a '*B*' frame is selected and the point is explained in greater detail This type of machine is flexible enough to cope with students differing considerably in intellectual ability A machine might operate on a 'constructed response mode' where the student first makes his own answer and compares it with the answer which is then supplied by the machine, or on an alternative procedure, where the machine first supplies a multi-choice solution and the student has to select the correct response. The advantages of these procedures are being investigated.

Mr. Leslie Reid, lecturer in psychology in the University of Aberdeen, discussed and actually produced the simpler forms of teaching machines which he has developed and is using at present in his research work in Scottish schools. His programmes have followed Skinner's principles with an accent on eliminating frustration and difficulties. From this point of view, teaching machines preserve the teacher–pupil relationship by ensuring that pupils are consistently rewarded, and not punished, for their responses. This is achieved primarily by the ordering of items in a suitable sequence, such that the transition from ignorance to knowledge is not a bumpy and apparently unmapped journey, but a smooth and logical progression in which a pupil can be expected to achieve success. Mr. Reid explained how a pupil working through a programme achieves insight through a gradual understanding of his subject; by contrast, that insight which a pupil achieves by a sudden flash of comprehension—the so-called 'eureka' phenomenon—is mainly a product of bad teaching.

Mr. Gordon Pask, of System Research, explained the principles of an adaptive teaching machine. Unlike a programmed machine the adaptive device itself 'learns' about the student's behaviour and modifies the training routine to suit each individual throughout the learning process. In teaching a manual skill the designer has to select certain parameters. These refer both (1) to the students' behaviour, such as the response latency, and (2) to the instructor's behaviour, such as the amount of 'cue' information with each category of problem. It will be observed that the parameters in (1) define measures of the student's behaviour which an instructor might make, and those in (2) consider the ways in which the instructor might manipulate a training routine. Thus the designer is constructing a computing device which measures the performance and then by an adaptive servo-mechanism adjusts the parameters of (2) in order to increase to a maximum the performance measure. Well-designed machines adopt a competitive strategy when the student is doing well and a co-operative strategy when he is making no improvement. Mr. Pask went on to describe how adaptive teaching machines might be used for group or classroom instruction. Here students are carrying out exercises in scientific inference and act either as a problem poser or a problem solver. The student coming quickest to the right conclusion using the minimum of evidence is most successful. A miniature economy is imposed on the group, and the machine controls the group's behaviour by modifying the parameters of the game. The most useful parameters seem to be 'cost' of communication, 'cost' of evidence, 'gain' for successful solution, and a bias on the process of role assignment.

Mr. K. Austwick, of the University of Sheffield, presented "An Educational Viewpoint" on the subject. Mr. Austwick has conducted preliminary experiments at schools on the teaching of mathematics with a simple linear programmed procedure. Preliminary results are encouraging and suggest that work learned by this method is well retained over a period of time. Programming of school and university courses is now under way. If such procedures were widely adopted they could lead to modifications in school design since they do not require the formal arrangement of a classroom. The possibilities of such machines to handicapped children, isolated children, personnel in the Services, and adults keeping up to date in a subject were brought out. On the other hand, the machines could not take over the 'human' role of the teacher, though they might give the teacher more time and opportunity to show his humanity.

The discussion was brisk enough and ranged from the university teacher anxious to discover how far machines could take over the part of tutor to a self-styled 'plain local family doctor' who knew they could not. These are early days for the teaching-machine movement, but it was apparent that we have here an educational development which is already arousing considerable interest and some opposition—both happy indexes. In a remarkably short time this type of instruction has now used 'hardware' ranging from simple pencil and paper booklets to electronic gadgets controlled by a full-scale computor. Systems are already being produced for public sale by both the publisher and the electronics industry. It is clear that the results of research are needed to give some guidance to this diversity, but research efforts in Britain are, as usual, on a small scale. To the academic psychologist this subject represents a further development in the field of communication systems, and it now offers another opportunity for studying how man can most efficiently receive and store information. But the pace and detachment of academic research are confronted by the urgency of the demand for instruction. The need in Britain for scientific and technical teaching is obvious enough, but is trivial in comparison with other areas of the world. Part of the impetus behind automated teaching is that universally, in so many subjects, there is so much demand for knowledge. There is every indication that this demand will continue to increase, and that it cannot be fulfilled by conventional methods.

H. KAY

BREATHING

UNDER the chairmanship of the Section's president, Sir Bryan Matthews, a symposium on "Breathing (External Respiration)" was held on September 4 by Section I (Physiology and Biochemistry) during the recent British Association meeting in Norwich. Four papers were presented, covering varied topics connected with respiratory physiology. Two of these had a clinical bias, and concerned the distribution of ventilation and flow of blood in the lungs, and the effects of oxygen on breathlessness. The other two demonstrated the application of respiratory physiology to aviation, one concerning the design of an aircraft breathing system, and the other describing the results of research into the effects of positive acceleration on the mechanics of respiration.

The symposium was opened with the paper “Variation of Ventilation and Blood-Flow in Different Parts of the Lungs in Health and Disease”, presented by Dr P Hugh-Jones, physician at the Hammersmith and King's College Hospitals Starting by showing a model of the air passages in the lungs, and demonstrating how a two-lumen tube could be used to collect expired air from the two lungs separately, Dr Hugh-Jones went on to describe the limitations of X-rays as aids to studying lung function Chest radiographs were shown to illustrate this, where there was a complete dissociation between the X-ray appearance and the subject's exercise tolerance Two new techniques were then described which could give details of local lung ventilation and blood supply, full tribute being paid to the advances of the physicists which had made them possible In the first, the subject is merely required to take in a quick breath of air containing a minute trace of radioactive oxygen (oxygen-15), and then to hold his breath for about 30 sec Counters arranged to look at different areas of lung tissue through the chest wall sense the arrival of the oxygen-15 in their fields and then follow its disappearance as it is washed away in the pulmonary circulation The rate of rise of the counting-rate is a measure of ventilation, and the rate of the ensuing fall in counting-rate is a measure of the local blood-flow The 2-min half-life of oxygen-15 is a disadvantage of the technique, but was immaterial at Hammersmith, where it is prepared on the spot in the Medical Research Council's cyclotron Other gases with longer half-lives might be used elsewhere where such facilities did not exist, for example, radioactive isotopes of argon or krypton Carbon dioxide made from oxygen-15 had been found to give better results when the technique was used for studying pulmonary blood-flow

The second technique described by Dr Hugh-Jones was that of regional gas analysis, using a mass spectrometer which could provide almost continuous analysis of up to four gases simultaneously Samples were taken through a 0 5-mm diameter tube which could be inserted into any chosen part of the lung during bronchoscopy. This allowed a study to be made of ventilation and blood-flow in any small area of the lungs, and information obtained in this way would be of value not only to the experimental physiologist but also to the physician and surgeon

The second paper, “Physiological Requirements in the Design of Aircraft Breathing Systems”, was presented by Squadron-Leader J Ernsting of the Royal Air Force Institute of Aviation Medicine The variation in properties of the atmosphere with increasing altitude was described and it was shown that the two main problems to be overcome at a flight-level of 40,000 ft were an air temperature of − 55° C, and an air pressure of 1/5 of an atmosphere. Ideally, aircrew and passengers should be provided with sea-level cabin conditions at any aircraft altitude, but the weight penalty of the structure needed to withstand the required pressure differential is too great, so that the physiologists reach a compromise with the engineers, and a cabin pressure equivalent to an altitude of 8,000 ft is chosen Though this is acceptable, the possibility of a failure in the pressurization system must be allowed for, and with this in view the physiological effects of decompression had been studied In a civil air-liner, window or valve failure will result in slow loss of pressure over several seconds In military aircraft, on the other hand, a smaller cabin, together with the necessary provision of aircrew escape systems, makes an explosive decompression, where ambient pressure is reached in 1/10 sec or less, a real possibility Dr Ernsting went on to describe the effects of explosive decompression, first, those due to the low final pressure, anoxia and decompression sickness, and secondly, those due to the rapid change in pressure Protection against anoxia could be provided by the breathing of oxygen between 10,000 ft and 40,000 ft, and the breathing of oxygen under pressure at higher altitudes Above 50,000 ft, the pressure required is so great that counter pressure has to be applied to the rest of the body to make breathing possible, and since at 63,000 ft, the vapour pressure of water at body temperature is equal to the barometric pressure, some form of pressure suit is required to prevent vaporization of body fluids Experiments on aircrew were described with a short film in which explosive decompression from 8,000 to 38,000 ft was followed by short periods of impaired function, even when the decompression was followed by breathing 100 per cent oxygen within 5 sec It had been found that the subject must already be breathing at least 40 per cent oxygen at the time of decompression if impairment of function were to be avoided

Dr Ernsting concluded by discussing the serious consequences of explosive decompression on enclosed volumes of gas in the body If the lungs were shut off from the outside air, serious or even fatal lung damage might occur Masks had to be designed which would allow free escape of air when decompression took place but which would immediately allow oxygen to be breathed under pressure The sudden expansion of 200 ml of gas in the gut to 1 litre was less serious but still very uncomfortable

The third paper, “Breathlessness its Alleviation by Oxygen in Health and Disease”, was presented by Dr J E Cotes of the Medical Research Council Pneumoconiosis Research Unit at Llandough Hospital Pointing out how appropriately this subject followed the centenary of the birth of J S Haldane, he went on to discuss the 12-month mortality figures of a group of 67 men severely disabled with breathlessness, and the curious finding that those whose symptoms were improved on breathing oxygen fared far worse than those on whom oxygen had no effect If the reason for this were known, then more might possibly be done for these patients

Dr Cotes then discussed the development of our knowledge of the effects of oxygen, and showed that as a respiratory stimulant, while lack of oxygen was of less importance than excess of carbon dioxide, it did play a small part at rest, and with increasing exercise it played an increasingly important part The administration of oxygen improved tolerance of exercise, and prolonged the time for which heavy exercise could be carried out Oddly enough, 50 per cent oxygen was better than 100 per cent oxygen in this respect, due possibly to the adverse local effects of too high oxygen tensions on the brain, and it was suggested that 50 per cent oxygen might be the better gas for respirators when work has to be carried out in unfavourable environments A small cylinder of 50 per cent oxygen should allow the wearer to run a mile in 3½ min A portable respirator was demonstrated, and sets like this were of great value in improving the tolerance of exercise by disabled men, not only subjectively, but also objectively in treadmill tests The increased work which could be carried out was associated with a reduction in pulmonary ventilation, the limit to capability of work being reached when the resulting ventilation reached the subject's voluntary maximum

Dr Cotes was unable to say why the breathing of extra oxygen should produce these effects, but many possibilities had been excluded, such as secondary changes in the pulmonary circulation, blood lactate-levels, or in the stiffness of the lungs This was the limit of present knowledge on the subject, but it was hoped that the mechanisms operating would soon be elucidated

The fourth and final paper in the symposium was given by Flight-Lieutenant D H Glaister, also of the Royal Air Force Institute of Aviation Medicine. under the title "Some Effects of Positive Acceleration on Respiratory Mechanics" Describing the interest physiologists have had in the effects of posture on breathing, Dr Glaister went on to show how the human centrifuge could be used to extend data beyond the 1*g* which normally limited laboratory experiments Positive acceleration was described as that acting in the same sense as gravity on a man standing on Earth's surface, and is measured in terms of this being 1*g* The postural change from lying to standing was thus equivalent to a change from 1*g* transverse acceleration to 1*g* positive acceleration

Circulatory effects prevented many experiments being carried out above 4 or 5*g*, since the degree of relaxation required to produce accurate respiratory measurements resulted in blackout or even unconsciousness Most comparisons were therefore made between 1 and 3*g* As positive acceleration was applied the diaphragm was pulled down by the weight of the abdominal contents, and at 3*g*, about 500 ml of air were drawn into the lungs Despite this, the vital capacity of the lungs fell by 300 ml, due partly to an increase in stiffness of the chest wall, and partly to a rise in intra-abdominal pressure which limited the full descent of the diaphragm The basic mechanics of respiration were then described, and it was shown how the various properties of lung and chest wall could be isolated and measured Results of experiments using these techniques had shown that no change occurred in the stiffness of the lung, nor in the air resistance of the passages leading to it, at least when the subjects were submitted to positive accelerations of 3*g*

The work done on the lungs had been measured by recording continuously the changes in their volume and the pressure gradient across them during quiet breathing This was shown to be unchanged at least up to 3*g* The total work done by the muscles of respiration. however, had to rise under the effects of increased positive acceleration, due to the stiffening of the chest wall and to the raised intra-abdominal pressure The overall efficiency of the respiratory process thus fell during positive acceleration Dr Glaister concluded by pointing out that while this lowered efficiency was probably of little moment at the lower *g*-levels, and with a subject at rest, it would impose a marked limitation to tolerance of exercise during prolonged positive acceleration

The symposium concluded with a brief discussion on the four papers D H GLAISTER

THE NORMAN LOCKYER OBSERVATORY

By Prof G K T CONN
Department of Physics, University of Exeter

SIR NORMAN LOCKYER founded and endowed the Hill Observatory at Salcombe Regis, Sidmouth He was its first director It is now the Norman Lockyer Observatory and has been, since 1948, intimately associated with the University of Exeter Lockyer was a remarkable man His discovery of helium in the Sun's spectrum in 1868 was made as a "private citizen", for he was not appointed to the Science and Art Department at South Kensington by Disraeli until 1875 On the formation of the Royal College of Science he became director of the Solar Physics Laboratory and professor of astrophysics When the Solar Physics Laboratory at South Kensington was transferred to Cambridge in 1913 he set about building a new observatory on the superb site at Sidmouth, at the age of seventy-seven Lockyer was the founder editor of *Nature* in 1869 and remained responsible for fifty years He was succeeded as chairman of the Observatory Council by Sir Richard Gregory, his successor as editor of *Nature* Indeed, both Lockyer and Gregory took great interest in the affairs of the old University College of the South West, now the University of Exeter, and it was Gregory's initiative that led to the intimate association of the Observatory with the University, "a possession which is unequalled in any but the older universities"

The peninsula Salcombe Regis is relatively free from industrial haze and Lockyer chose a site with a superb horizon and a very low noise-level, it is now of some 44 acres The buildings consist of offices and laboratories with a well-equipped library, a store room. a cottage and three domes The McLean dome houses a 12-in refracting telescope with an objective prism of 20°, mounted with a 10-in visual refractor on a Grubb equatorial mounting with electric control (The donor, Sir Francis McLean. was the co-founder of the Observatory and became known to the public as the first airman to fly under the Thames bridges in 1912) The Kensington telescope is a 9-in refractor with an objective prism of 45°, made by Henri Frères, and giving great transparency in the near ultra-violet, on a Cooke equatorial with Russell control, a 10-in Cooke visual telescope is mounted alongside The Mond photographic telescope consists of a four-camera, astrographic equatorial by Cooke with three Zeiss triplet lenses of apertures 17, 14 and 10 cm and one Zeiss anastigmat, aperture 7 cm The mounting is designed to allow an uninterrupted circumpolar motion at all declinations, the clock drive is fitted with electric control There are various pieces of equipment which have not hitherto been set up. for example, a 30-in reflecting telescope and a 21-in siderostat

Work began in 1919, the first paper, published in the *Monthly Notices of the Royal Astronomical Society* in 1920, being "Spectroscopic and Magnitude Observations of Nova Cygni III, 1920" Some 90 research papers have been published, about 40 in the period 1920–36 and 45 during 1936–56, when D L Edwards was director (see p 112 of this issue) The work has been largely on stellar spectroscopy Since 1936 the principal lines of work have been the development of methods of measuring stellar gradients and colour temperatures, using the McLean prismatic camera, and a photographic survey of galactic clusters made with the Mond telescope New ground has been broken in recent years with the initiation of photometric research on the twilight luminescence of atmospheric sodium The Kensington telescope has been used to study the irregular variable star, γ-Cassiopeiæ, there are some 460 spectrograms of this star in an almost unbroken sequence from 1921 to 1956

The Observatory was, and is, maintained as a non-profit making corporation through endowments and funds provided by donors Since 1948 the management has been vested in the Council of the Corporation on which the University of Exeter has a definitive majority The funds available have never been lavish Rapidly rising costs-since the War, together with the development of sophisticated experimental techniques, have meant that the position of the Observatory as an effective centre of original research has become progressively more difficult and indeed critical Against the background of developments in satellites and in space research, the extensive recent progress of studies of the upper atmosphere and the revival of interest in astronomy and astrophysics, such a difficult position presents an obvious challenge The site is large enough for astrophysical work and for an extensive programme of research and teaching in geophysics, a growing interest of the University's Department of Physics, and of geomagnetism, an interest of the Department of Mathematics

The first immediate change of activity for the Observatory will follow from the interests of Dr K Weekes and Mr A Nichol Conditions in the high atmosphere can be studied by various means using both radio and optical techniques Up to the height of the greatest electron concentration in the F_2 region it is possible, in principle, to infer the distribution of ionization from routine soundings Above the peak of the F_2 region, artificial satellites may be used, or Thomson scattering of radio waves and optical experiments An examination of the radio waves emitted by satellites may be used to infer the integrated electron density between the receiver and the satellite This is relatively insensitive to the distribution of electrons, but as the satellite changes height in the course of a transit, the distribution at satellite height may be inferred The most valuable direct means of studying the distribution of electrons in the high atmosphere is by the Thomson scattering of radio waves by free electrons Examination of experiments in the United States to heights of about 700 km suggests that useful results should be obtained to a height of about 2,000 km It is commonly believed that the emission lines of OI at 6300 and 6364 Å are excited by recombination in the F region The correlation between the optical intensities and radio measurements of ionization clearly must be examined Moreover, it is possible, with careful techniques, to measure the line-width of the OI lines and so obtain a direct measure of the temperature of the atmosphere at the height of emission of these lines

To a classical astronomer nowadays anything below a fixed star is no doubt to be termed 'terrestrial', just as to many people any study above roof-level is termed 'astronomical' The future is seen to lie in the wedding of optical with radio techniques in the fields of astrophysics and geophysics and of geomagnetism Moreover, the vitality of the Observatory has suffered from its relative isolation The University did indeed, so Gregory said, acquire "a possession which is unequalled in any but the older universities" The means are there to train students and research workers in the old and in the new techniques of exploring space The raw material of research is to hand The Observatory began as Lockyer's hobby in his old age it has acquired a reputation in astrophysics and an affectionate regard in the south-west of England By acquiring additional eyes we shall see more and see farther An old man's hobby has become a young University's opportunity.

LONG-RANGE RADIO COMMUNICATION BY SATELLITE MICROWAVE DIPOLES

AN article under this title detailing the West Ford Project was published in *Nature* of September 23, p 1237 At the eleventh General Assembly of the International Astronomical Union held in Berkeley, California, on August 24, two resolutions were unanimously adopted concerning that Project and similar space experiments that might have harmful effects on astronomy At the recent General Assembly of the International Council of Scientific Unions in London, a resolution similar to Resolution No 1 of the International Astronomical Union was adopted, which refers to the whole of science, rather than to astronomy in particular

The following is the text of the resolutions adopted by the International Astronomical Union

Resolution No 1 *Viewing* with great concern the grave danger that some future space projects might seriously interfere with astronomical observations in the optical as well as in the radio domain,

and *believing* that a degree of contamination of space which at the present time would be hardly detectable, might, if long-lived, well be disastrous to future observations with improved techniques,

and *maintaining* that no group has the right to change the Earth's environment in any significant way without full international study and agreement,

the International Astronomical Union *gives* clear warning of the grave moral and material consequences which could stem from a disregard of the future of astronomical progress,

and *appeals* to all Governments concerned with launching space experiments which could possibly affect astronomical research to consult with the International Astronomical Union before undertaking such experiments and to refrain from launching until it is established beyond doubt that no damage will be done to astronomical research

Resolution 2 The International Astronomical Union expresses its appreciation that the plans for Project West Ford have been publicly announced well ahead of proposed launching and of the United States Government's official policy* that further launchings will be guided by the principle that such projects shall not be undertaken unless sufficient safeguards have been obtained against harmful interference with astronomical observations

Nevertheless the International Astronomical Union views with the utmost concern the possibility that the band of dipoles proposed in Project West Ford might be long-lived, and it is completely opposed to the experiment until the question of permanence is clearly settled in published scientific papers with adequate time being allowed for their study The International Astronomical Union is opposed to any experiment which might hamper future developments in astronomy

If a short lifetime for the dipoles and the harmless nature of the experiment can be assured, and if Project West Ford is carried out, the International Astronomical Union regards it as essential that the fullest observations of, and experiments on, the properties and behaviour of the band of dipoles be carried out by all possible means The observations and experiments should be performed and analysed according to the highest scientific standards and with the best equipment available, bearing in mind that signals which are barely, or not, detectable to-day will probably cause serious interference with future scientific research because of the development of more sensitive equipment

The observations and experiments to be made on West Ford are likely to be difficult to perform, and will, in many ways, be similar to those carried out by the authorities responsible for operating West Ford Moreover, much specific information such as precise and up-to-date ephemerides will be required The International Astronomical Union will attempt to arrange for rapid and full co-operation among astronomers making observations and calculations, and to provide for world-wide dissemination of their results conforming to accepted standards of scientific research

The International Astronomical Union welcomes the position[*] taken by the Government of the United States that any decision on later experiments of the West Ford type will be taken in the light of the results obtained from the presently proposed experiment To enable the International Astronomical Union to obtain the necessary data, it requests the Government of the United States to grant full privileges to a group of astronomers, acceptable both to the Government and to the Union, to co-operate with West Ford authorities in performing quantitative experiments to determine the properties of the proposed belt of dipoles, its changes with time and location, and its impact upon present and future astronomical research

---

[*] Letter of August 11, 1961, from Dr J B Wiesner to Dr L V Berkner

THE SWEDISH SEED ASSOCIATION

THE title traditionally given in English translations to the Sveriges Utsadesforening does not perhaps fully indicate the scope of the scientific work in this pioneer research station

Throughout its development the Swedish Seed Association has had strong support from both farmers and scientists, and when the seventy-fifth anniversary of the Association was celebrated in July 1961, King Gustav VI Adolf welcomed a large attendance of members living within reach of each of the eight branch stations as well as growers and technicians who are directly in touch with the work at the Svalof headquarters

Founded in 1886 as a co-operative association of farmers on the initiative of Birger Welinder, who farmed at Svalof, it reflected a big increase in interest in crop-husbandry problems During the extension of the arable cropping area in the middle of the nineteenth century Swedish farmers had come to realize that the severity of the winter, the relatively long days and the short summers made demands which could not be met by even the best of the foreign varieties.

From the beginning the pioneer plant breeders at Svalof fought hard to convince the large body of farmers and seed growers of the importance of using the best scientific techniques in the improvement of crops As the programme developed under Profs Hj Nilsson, N H Nilsson-Ehle, A Åkerman and other distinguished scientists and agronomists it became clear that improved crop varieties could best be obtained through an active programme of research some of which must be of a fundamental nature

Cytogenetic Research

Practical breeding work is undertaken at Svalof on the herbage crops, oil and fibre crops, and the root crops for fodder production as well as on the four main cereals

For this breeding work material is provided mainly from three sources

(1) By the introduction of valuable genes from primitive forms or wild species, or from cultivated varieties with special characteristics One of the most marked features at Svalof is the importance attached to collaboration with crop improvement and other research stations in foreign countries Valuable plant material has been obtained from a wide range of countries either by exchange or by plant collecting expeditions

(2) By inducing mutations The Swedish workers are effectively using this technique to increase the genetic variability of the cultivated varieties and breeding material with which they are working

(3) By increasing the chromosome number through auto- and allo-polyploidy, thus offering new possibilities for the development of new genotypes Especially promising are the polyploids of red and white clover, rye and turnips (Oil rape is an important crop in Sweden. By crossing artificially induced polyploids of turnip rape and different types of kale, new high-yielding and hardy varieties of winter rape are being developed)

Research of a more fundamental nature is in progress to ascertain the causes of reduced fertility in artificial polyploids and to investigate different methods of using polyploids in breeding programmes

In the development of polyploids the work at Svalöf has benefited greatly from the close co-operation of Prof A Muntzing at the Institute of Genetics situated a few miles away in the University of Lund, and similarly with Prof Å Gustafsson on induced mutations in barley and other crops Mutations have been induced in smooth-stalk meadow grass which have brought a return to cross-fertilization as the means of reproduction in place of apomixis

In this way the range of genetic variation has been greatly increased

The nature of yield in some species is being investigated genetically and physiologically with the aid of special growth chambers

Biochemical Investigations

Great importance is attached to the breeding of new varieties of improved quality and in this the chemical laboratory is closely concerned

More fundamental studies are concerned with the enzyme changes associated with the ripening of seeds In a country extending as far north as northern Iceland, and as far south as Northumberland, the ripening of grain and other seed crops is of special importance

Cereal Breeding

The breeding of spring oats at Svalof has been of inestimable value to Britain

Victory, Eagle, Star, Sun II and Blenda all came from Svalof, and these represent some of the best-known varieties grown in Britain during the past fifty years (A peculiar rhythm of growth is needed in oat varieties grown around Lake Malaren, where severe drought conditions are likely to occur in spring, and the most successful varieties are those in which the shooting of the tillers is delayed for a period)

Barley varieties in Sweden cover a wide range of climatic conditions, and Svalof has been successful in breeding early six-row barleys for middle and northern regions as well as the varieties for southern Sweden, of which Ymer and Freja have been successful in Scotland and England

Barley has been used as a convenient subject for experiment at Svalöf to find how the mutation process may be directed towards the production of desirable mutants Much is being learnt by the association of cytogenetical analysis of the mutations with a close observation of field characters in barley

Herbage Crops

The ecotype concept was largely developed in Sweden, and it is not surprising that special attention has been given to the interesting range of regional types of red clover growing between southern Sweden and the northern limits of the crop Day-length reactions are being studied in relation to growth rhythm, time of flowering and to the stage at which reserve nutrients are stored Of notable success is the work on resistance to stem nematodes in red clover

The Filial or Branch Stations

Most of the new varieties introduced in recent years have been the result of collaboration between the main station at Svalof and one or more of the eight 'filials' or branch stations At Ultuna (Uppsala), for example, some of the main work on red clover, lucerne and peas has been undertaken Vegetable crops, if one excepts the important pulse crop of dried cooking peas, are not at present included in the programme of work of the Association

Seed Certification and Distribution

To relieve the Swedish Seed Association of the task of multiplying and distributing seed of the Svalof varieties, the General Swedish Seed Co was established in 1891 In Sweden, the seed trade is organized differently from Britain, and the Seed Co at Svalof finds it necessary to produce large tonnages of seed This is done partly on the farms owned by the Company

The Swedish Seed Association co-operates closely with the Central Government Seed Testing Station in the production of State certified seed, and all the seed which leaves Svalof is of certified grade

From the beginning the Swedish Government has given monetary support to the plant-breeding work, and this at present amounts to about £135,000 a year Other sources of income are the profits from the General Swedish Seed Co at Svalof, research grants and donations from foundations and private organizations, and fees for analyses made in the laboratories.

Links with Britain

By the year 1919 Svalof was already well established, and it was natural that representatives of the National Institute of Agricultural Botany, founded in January 1919, should visit Svalof to take advantage of the unique experiences gained there in crop improvement work In the party representing the Council of the National Institute of Agricultural Botany was Prof R G Stapledon, then newly appointed to Aberystwyth The value of the ecological approach to variety testing, and to the collection and use of local varieties and ecotypes developed in Sweden was particularly appreciated by the visitors from Britain The ecotype concept was to be further developed by Stapledon at the Welsh Plant Breeding Station, and by J W Gregor in Scotland

Exchange visits between Svalöf and the crop improvement stations in Britain have been numerous in recent years during the directorship of Prof E Åkerberg, and they have undoubtedly been of great benefit to both countries

All workers in crop improvement, whether agricultural botanists, plant breeders, farmers or seedsmen, will join in congratulating the Swedish Seed Association on the remarkable achievements of the past seventy-five years and in sending good wishes for the future

F R HORNE

OBITUARY

Prof. Eric Bradshaw, M.B.E.

PROF ERIC BRADSHAW died suddenly at his home in Marple, Cheshire, on August 15 He was aged fifty-two and was professor of electrical engineering and director of the Electrical Engineering Laboratories in the Faculty of Technology of the University of Manchester at the Manchester College of Science and Technology

Eric Bradshaw was the son of Lady Bradshaw and the late Sir William Bradshaw, and was educated at King's School, Grantham, and in the Department in which he later became professor He was a student under Prof Miles Walker and graduated in the University of Manchester with a degree of B Sc (Tech) with honours in 1930, and with the degree of M Sc (Tech) in the subsequent year Following his graduation he spent some time with the British Thomson-Houston Company at Rugby

He became a lecturer and afterwards special lecturer in high-voltage engineering at the Royal Technical College, Glasgow, during 1933–44 While in Glasgow he was responsible for the inception there of the high-voltage laboratory and gained his Ph D at the University of Glasgow In 1944 Eric Bradshaw moved to his old Department in the College of Technology, Manchester, as senior lecturer in high-voltage engineering, he was appointed professor of electrical engineering in October 1952

After the War he was a pioneer in the organization of courses at a very high level for the senior engineering staff of the newly nationalized electricity supply industry and was responsible for many such courses at Electricity Hall, Buxton, during the years 1947–52 Most of these courses, changing their content from time to time but retaining Bradshaw's form of organization, eventually became a standard part of the educational activities of the Central Electricity Authority (later the Central Electricity Generating Board) and the Area Boards During the same period he founded, in 1948, the *Bulletin of Electrical Engineering Education*, and continued thereafter as organizer and editor until his untimely death This journal to-day circulates to between four and five hundred universities, colleges and other subscribers throughout the world

Bradshaw's published work and interests lay in four categories In the field of units, symbols and nomenclature, he was one of the authors of a well-known symposium of papers to the Institution of Electrical Engineers on the M K S system of units, was the author of a book on the same subject, and served on British standards and international electrotechnical committees During his career at Glasgow and his early years at Manchester he published work on high-voltage measurements using oscillating electrode systems Immediately afterwards his attention turned to problems of the power supply industry, and he was responsible for several devices for the direct measurement of rate of change of frequency, one of which was published by the Institution of Electrical Engineers His latest interests lay in the field of electric railway traction He was responsible for the design and building at Manchester of a track performance calculator for British Railways, the details of which were published in a paper for the Institution of Electrical Engineers, latterly this work had extended to analogue devices for determining short-time thermal ratings of traction equipment

He was known throughout the length and breadth of Britain for his work in furtherance of higher education, many were the advisory committees, colleges and universities to which he gave his time Many indeed, furthermore, are the individuals, both within and without his profession, who have reason to be grateful for his kindness of heart Eric Bradshaw was incessant in his activity on behalf of cases of adversity and hardship which came his way, this particularly, but in no way exclusively, applied to any student who through no fault of his own was likely to be incapable of pursuing his studies

Eric Bradshaw was a keen amateur musician, played with the orchestra organized from time to time in the College of Science and Technology, and generously gave his time and support to musical events in the College, particularly those centred around the organ Perhaps his greatest lay interest was in the history of the Industrial Revolution He was intensely interested in the development of railways and canals, and frequently lectured to societies and schools on these subjects He married Joyce Ena Smith in 1935, by whom he is survived

C Adamson

NEWS and VIEWS

The Norman Lockyer Observatory

Mr D R Barber

Mr D R. Barber retired on September 30 from his post as superintendent of the Norman Lockyer Observatory at Sidmouth, after twenty-five years service (see also p 108 of this issue) He was appointed as assistant to the late W J S Lockyer in September 1936 and on Lockyer's death in December continued with the new director, D L Edwards, until 1956, when Edwards died, Barber then became superintendent Edwards and Barber introduced precise methods of photographic photometry into the evaluation of stellar spectra From 1938 they applied the Greenwich colour temperature technique in a modified form to the measurement of spectrophotometric gradients and their work on the changes in the continuous spectrum of γ-Cassiopeiæ (*N L O Comm*, 58, 62, 64) is well known About this time Barber built the first of a series of night-sky photometers, designed to measure the green, OI, line of the air-glow This instrument was taken to the Lick Observatory, Mount Hamilton, on Barber's appointment to a Martin–Kellogg fellowship in the University of California (1940–41) With this he demonstrated for the first time a definite correlation between the intensity of the green line and geomagnetic activity (*Nature*, 148, 88 (1941))

During 1941–45, Barber worked at the Kodak Research Laboratories in England, and on his return to the Observatory he became interested in the sodium *D*-line emission in the twilight and night skies, which he studied by photographic and photoelectric methods He established the presence of highly polarized twilight emission following solar flare and geomagnetic activity (*J Atmo Terrestr Phys*, 10 172, 1957), and a dependence of the intensity of emission on lunar phase, presumably because of tidal movement of the upper atmosphere at the level of sodium emission, 70–110 km (*Intern Astro Union Draft. Rep*, Berkeley Meeting, August 1961, *Rep Comm*, 21, *Luminescence du Ciel*) Lately Barber's interests have broadened to include solar–terrestrial relationships, certainly he has already obtained fascinating and remarkable results Those on the effects of living organisms will certainly keep him occupied in his retirement

John T Tate Medal of the American Institute of Physics

Dr P. Rosbaud

Dr Paul Rosbaud has been awarded the first John T Tate International Medal for distinguished service to physics The Medal is of gold and has been established in order to recognize distinguished service to physics by individuals who are neither residents nor citizens of the United States 1,000 dollars accompany the award The late Prof J T Tate, who died on May 27, 1950, was dean of the College of Science, Literature and Arts at the University of Minnesota, and served as research professor of physics, chairman of the Governing Board of the American Institute of Physics, and managing editor of the American Physical Society.

Dr Rosbaud before and during the Second World War was science editor for the Springer Company, a Berlin publishing house. As an editor, he is credited with being the driving force behind the creation of new journals and the improvement of existing periodicals, as well as being responsible for the publication of many books by scientists. Born in Graz in 1896, he received his doctorate in Berlin and then carried out research in X-ray crystallography. He joined the Springer publishing house in the 1930's and succeeded in sending its valuable scientific books to safety before the bombing of Berlin. His extraordinary courage and acquaintanceship with friends in high places, who were uncommitted to the Nazi régime, enabled him to keep in touch with scientists in occupied Europe during the War and to boost their *morale*. He had two French war prisoners, who were physicists, staying with him on *parole*, and enabled them to work and keep in touch with scientific developments. They are now prominent atomic scientists.

During the War he risked his life and freedom by communicating with Allied scientists via the Norwegian underground and neutral channels and by being the confidant of German physicists who opposed the decline of science under the Nazis. After the War, he became editor for Butterworth Scientific Publications (London), and later served as scientific director of the Pergamon Press. Since 1956 he has been European editor for Interscience Publishers and a consultant to other publishing companies.

Council for Scientific and Industrial Research New Appointments

Five new members of the Council for Scientific and Industrial Research were recently appointed, and took office on October 1. They are Mr. L H Bedford, director of engineering, Guided Weapons Division, English Electric Aviation, Ltd, Mr G B R Feilden, managing director, Hawker Siddeley Brush Turbines, Ltd, Prof E R H Jones, Waynflete professor of chemistry, University of Oxford, Prof O A Saunders, professor of mechanical engineering, Imperial College of Science and Technology, London, and Mr H C. Tett, chairman and managing director, Esso Petroleum Co, Ltd. Three members who have completed their five-year term of office retired on September 30: the former chairman, Sir Harry Jephcott, chairman of Glaxo Laboratories, Ltd, Prof C E H. Bawn, professor of inorganic and physical chemistry, University of Liverpool, and Sir Willis Jackson, at present director of research and education, Associated Electrical Industries (Manchester), Ltd. A fourth member, Sir Walter Drummond, who was also due to retire on September 30, has been re-appointed for a period of three months. The present constitution of the Research Council is: *Chairman*, Sir Harold Roxbee Cox, *Members*, L H Bedford, Prof B Bleaney, Prof C F Carter, Dr J W Cook, Frank Cousins, Sir Walter Drummond, G B R Feilden, Prof E R H Jones, Vice-Admiral Sir Frank Mason, Prof. O. A Saunders, Dr C J Smithells, H C Tett, Lewis T Wright, *Secretary*, Sir Harry Melville.

Ergonomics in Industry

Delegates from industry, the trade unions, universities, research associations and Government departments attended the three-day Conference on Ergonomics organized by the Department of Scientific and Industrial Research in London during September 1960. The Proceedings of the Conference have now been published and include all papers and a verbatim report of the delegates' discussions (*Proceedings of Conference on Ergonomics in Industry*, 27–29 *September*, 1960, published for the Department of Scientific and Industrial Research by H M S O. Price 12*s* 6*d*. By post, 13*s* 4*d*.) Ergonomics, the scientific approach to the problem of fitting the job to the worker, is aimed at improving industrial efficiency by designing equipment so that its operation is within the mental and physical capacities of the average person. The purpose of the conference was to bring ergonomics to the notice of senior people in industry and to provide an opportunity to discuss its wider implications, in particular where ergonomics fits in with the interests of production engineering, equipment design, work study and industrial health.

Mental Health Book Review Index

The *Mental Health Book Review Index*, which is sponsored by the World Federation for Mental Health, the International Council of Psychologists, the American Foundation for Mental Hygiene, and the Research Centre for Mental Health, New York University, lists references to signed book reviews appearing in 150 journals in the English language, of which 133 are still current and publish reviews, regularly or occasionally. The indexing begins with the volumes current in January 1955. Books are listed with references to three or more reviews when they appear in psychological, psychiatric, or psychoanalytical journals, when the journals represent at least three fields in the behavioural sciences as a whole, when at least three of the journals originate outside the United States, or when the books reviewed are in foreign languages. The bibliography of books in the sciences of human behaviour and the field of mental health which results from this compilation of book reviews is intended for information only, and neither inclusion nor omission of a title implies a definitive selection. In addition to the 2,062 titles listed since the first issue of the *Index*, about 6,900 titles of books with at least one review are on file until they can be listed under these criteria. The *Index* is published annually under the auspices of the American Foundation for Mental Hygiene, the most recent (6, No 11, 1961) being published in July.

Diet of Sheep

Sheep are highly selective in their grazing habits, picking and choosing between the different plants available in a mixed sward, and even between stem and leaf on individual plants. It is only during the past few years that the extent and importance of such sheep preferences in influencing both the diet of the animal and the botanical composition of the pasture have been appreciated. G W Arnold, of the Division of Plant Industry, Commonwealth Scientific and Industrial Research Organization, has recently described preliminary results of research on the grazing behaviour of merino sheep on the southern tablelands of New South Wales (*Rural Research in the Commonwealth Scientific and Industrial Research Organization*, 36, June 1961). In one experiment, a seeds mixture of lucerne and *Phalaris tuberosa* was sown in rows and grazed continuously by three-year-old merino wethers. The sheep selected leaf in preference to stem where this was physically possible. Furthermore, they invariably chose the leaf or stem material containing most nitrogen. In another experiment, a direct relationship was found between the amount of pasture available and the time spent by sheep in grazing. In spite of a progressive increase in the time spent, the sheep were unable to maintain their live-weights as grazing became more time-consuming. The animals grazing longest suffered the least loss of live-weight. This suggests that other sheep stopped eating because of fatigue before their appetites were fully satisfied. Such differences between individual sheep in their capacity to graze for longer periods on poorer pastures could have practical implications, particularly if the character should prove to be heritable.

Geological and Geographical Research in the U.S.S.R.

A review of geochronology research in the Soviet Union is given by D. I. Shcherbakov (*Priroda*, 2, 9, 1961). The scale appended gives, for example (in million years), Upper Cretaceous 100, Carboniferous 320, Cambrian 570. The oldest Pre-Cambrian 3,400–3,500. A. I. Perel'man (*Priroda*, 1, 41, 1961) is continuing his discussion of geochemical landscapes by applying geochemical studies to the previous periods of the Earth's history, thus contributing to a new science, named by A. A. Saukov "historical geochemistry". R. V. Teis (*Priroda*, 4, 31, 1961) provides a short summary of the work on oxygen isotopes in the Soviet Union, especially of the isotope palæothermometry as applied to the calculation of the temperature of ancient seas as determined by the date derived from sedimentary rocks of the Russian platform and those of the Crimea. Isotope methods were also used to determine the geochemical history of atmospheric oxygen especially during the process of photosynthesis. The Lake Balkhash, in spite of being situated in a semi-desert zone and prone to evaporation, has a very low salinity, namely, 2.84 gm./l. According to M. N. Tarasov (*Priroda*, 2, 72, 1961) this may be due to the infiltration or seepage of the Lake waters into the fringing rocks surrounding the numerous bays of this Lake. Other suggestions and hypotheses are also discussed.

Angara–Yenisei Hydroelectric Schemes

A short review of these schemes has recently been prepared by P. M. Dmitrievsky (*Priroda*, 1, 25, 1961). Both the Rivers Angara and Yenisei will have 'cascades' of six dams, providing power for hydro-electric stations. The largest of these, situated at Bratsk, on the River Angara, was begun in 1955. Its head is more than 100 m., power, 4.5 million kW., and annual output, 21.7 milliards kW./hr. The annual output of the Angara set will be 70 milliards kW./hr., and of the Yenisei scheme 120 milliards kW./hr. Completion of some units is expected by 1965. The area served by these two schemes is rich in coal, iron ore, aluminium ore and salt.

High-Temperature Induction Furnaces

The design of laboratory high-temperature induction furnaces has been examined in both theoretical and practical aspects by P. H. Dundas, of the Carbon Research Laboratory, Chemical Engineering Department, Imperial College of Science and Technology, London. Dundas has attempted to simplify an otherwise complex electrical engineering analysis, so that the research physicist can avoid wasting much time and energy over trial and error methods when faced with problems of high temperature that can be satisfied only by the use of induction heating. An article in *Research Applied in Industry*, published by Butterworths, 88 Kingsway, London, W.C.2, provides a new approach to the use of induction heating as an important high-temperature tool (14, No. 7, July 1961).

Histoplasmosis

The discovery of benign histoplasmosis in 1945 spurred interest in a disease that had been considered rare and invariably fatal. During the ensuing years, a great deal of basic information has been gathered on the epidemiology of histoplasmosis. Most of this knowledge has been gained through the development and use of immunological tests, case history studies, and the screening of soil samples and animals for the presence of *Histoplasma capsulatum*. In a review of existing information (*Mycopathologia et Mycologia Applicata*, 14, August 1961), Dr. Libero Ajello, of the Communicable Disease Centre, Mycology Unit, Public Health Service, U.S. Department of Health, Education and Welfare, describes how the culture of internal organs of domestic and wild animals has revealed the presence of *H. capsulatum* in different parts of North America, Central America, South America and Africa. It shows also that this fungus apparently cannot multiply in internal organs of birds, the body temperature of which is higher than 40° C. Epidemiological investigations almost invariably revealed that *H. capsulatum* was present in the soil of the region where epidemics occurred. Sometimes the soil containing *H. capsulatum* was transferred by human activities from infected localities through non-infected air, lessening the possibility that the spores of the fungus have been transported by air from the central endemic areas (Ohio–Mississippi–Missouri river valley) to localities far removed from these regions. In the same journal, Henry C. Sweany considers the diagnosis of histoplasmosis and shows that the disease has such a clinical variability that it may simulate not only tuberculosis, sarcoidosis, lymphomas and certain severe anæmias, but it may also occur together with any one of them, which makes the diagnosis all the more difficult. In 25 per cent of the cases studied, it was associated with tuberculosis.

The Australian Mathematical Society

The Australian Mathematical Society met in Brisbane, at the University of Queensland, during May 24–26, and held a joint session with the Australian and New Zealand Association for the Advancement of Science on May 29, 1961. Sixty members attended. The new Council elected was as follows: *President*, Prof. T. G. Room; *Vice-Presidents*, Prof. A. L. Blakers and Prof. L. S. Goddard; *Publications Secretary*, Dr. G. E. Wall; *Treasurer*, Prof. C. S. Davis; *General Secretary*, Prof. H. O. Lancaster. A successful summer research institute was held at the Australian National University, Canberra, during January and February 1961, with Prof. T. M. Cherry as director. A second institute meeting will be held in Canberra, in January 1962, with Prof. E. S. Barnes as director.

Mathematical Reprints

The reprints of the Chelsea Publishing Co., 50 East Fordham Road, New York, 58, have made available a large number of scarce or unobtainable mathematical classics The most recent batch illustrates the wide variety which has been selected Salmon's *Higher Plane Curves* (4 95 dollars) and Bell's revision of Frost's *Curve Tracing* (3 50 dollars) are museum pieces, no longer recommended reading but held in warm affection by all who know them *Projective Geometry* (4 95 dollars) is a translation of the second part of the 1935 book by Schreier and Sperner, the first part having already been issued in translation by the Chelsea Co , under the title of *Modern Algebra and Matrix Theory*, this completes the version of a work which, if now a little out of date, is still recommended by the experts as a suitable introductory university text on algebra and algebraic geometry Then an omnibus volume (6 dollars) contains two monographs by Weyl, *Das Kontinuum* and *Mathematische Analyse des Raumproblems*, Landau's tract (1916, second edition 1929) on function theory, which inspired so many undergraduates in the 'twenties, and the famous Riemann dissertation, on the foundations of geometry, with Weyl's notes The books are well produced and stoutly bound, and many libraries, private and public, may be glad of the opportunity to fill gaps reasonably cheaply

The International Society for Stereology

The International Society for Stereology was established during May 1961 Stereology is the science of three-dimensional interpretation of flat images, such as sections and projections, that is, the extrapolation from two- to three-dimensional space The methods range from the evaluation of shadows through serial sections to statistico-geometrical analysis Stereology finds applications in microscopical anatomy, electron microscopy, geology, metallurgy, aerial mapping, astronomy and cosmology The Society is holding its first congress at Key Biscayne, Florida, during April 24–26, 1962 Further information concerning the Society and the congress can be obtained from Dr Hans Elias, Department of Anatomy, Chicago Medical School, 710 South Wolcott Avenue, Chicago 12, Illinois

Postgraduate Courses at the Imperial College of Science and Technology

Information contained in a booklet (*Shorter Postgraduate Courses*) issued by the Imperial College of Science and Technology relates to shorter postgraduate courses to be held at the College during the autumn term of the session 1961–62, and advance information on those to be held during the spring and summer terms The courses included comprise not only those specially arranged but also a selection of lecture courses forming part of the normal departmental syllabuses, where these are likely to be of interest to students as separate courses and where it is possible to accept part-time students The booklet is divided into two sections covering part-time courses and short full-time courses Further information on all these courses can be obtained from the Registrar, Imperial College of Science and Technology, Prince Consort Road, London, S W 7 Details of full-time postgraduate courses extending over one year are given in a separate booklet, *Postgraduate Courses*, which is obtainable from the Registrar, price 2*s*

B.B C Research Scholarships

Each year the B B C awards research scholarships (valued at £500 per annum) to university graduates in electrical engineering or physics, to enable them to work at any university in the United Kingdom for a higher degree in those fields of telecommunications or physics which have an application to sound or television broadcasting This year, three scholarships have been awarded to Mr J Elliott (1 year), of the Imperial College of Science and Technology, London, who has been working under Prof C Cherry and Mr J Roberts, to Mr K L Hughes (2 years), of the University of Birmingham, for work under Prof D G Tucker and Prof J T Allanson at Birmingham, to Mr B J Tilley (2 years), of the University College of Swansea, who will work at Swansea under Prof W Fishwick and Mr J MacCormack

University News: Southampton

The title of reader in botany has been conferred on Dr J M Lambert

Loughborough College of Technology

Dr G F Reynolds has been appointed reader in analytical chemistry at Loughborough Previously, Dr Reynolds was a principal scientific officer in the Chemical Inspectorate at the War Office

Announcements

Dr Sigvard Eklund, of Sweden, has been appointed director-general of the International Atomic Energy Agency, in succession to Mr Sterling Cole, whose term of office expires on November 30

Sir Willis Jackson has been elected president of the British Association for Commercial and Industrial Education

Stafford Beer, founder of the Department of Operational Research and Cybernetics, United Steel, has now become managing director of SIGMA (Science in General Management), Ltd SIGMA was recently set up to offer professional services in operational research to industry and Government Roger Eddison is now director of operations of SIGMA Previously Mr Eddison was manager of the Plans and Methods Department in NAAFI

Mr C T Melling, a deputy chairman of the Electricity Council, has been appointed a member of the Advisory Council on Research and Development of the Ministry of Power, in succession to Sir Josiah Eccles

Mr L H Welch, recently chief electrical engineer to the London Electricity Board, has been appointed as industrial relations consultant to the British Electrical and Allied Industries Research Association

Sir Cyril Hinshelwood, past president of the Royal Society, will deliver the 1961 Eddington Memorial Lecture in Cambridge at the Arts School Lecture Theatre, Bene't Street, on November 10, at 5 p m The title of the lecture is "The Vision of Nature"

The Natural Rubber Producers' Research Association is holding a symposium under the general title, "Fundamental and Practical Approaches to Ageing Protection", at its laboratories at Welwyn Garden City during November 2–3 Attendance will be by invitation only Further information can be obtained from the Natural Rubber Bureau, 19 Buckingham Street, Adelphi, London, W C 2

The Association of Universities of the British Commonwealth has issued invitations to its member universities to appoint delegates to the ninth quinquennial Congress of Universities of the Commonwealth, which will be held at the University of London during July 15–19, 1963, and which will mark the jubilee of the founding of the Association

COAL SCIENCE

THE biennial International Conferences on Coal Science, which began in The Netherlands in 1955, moved on the most recent occasion to France: the fourth Conference was held at Le Touquet during May 30–June 2. Tradition was followed in the extent of local co-operation, and the Mayor, Dr. Jules Pouget, received delegates and their wives at the Town Hall. A tribute should be paid, for the excellent organization and remarkable hospitality, to the French sponsors, the Centre d'Études et Recherches des Charbonnages de France, particularly to Prof. M. Letort (a director-general of the Centre), who presided, R. Loison, the French member of the International Committee, and A. Ploix, who undertook all the details of organization. The conference was fortunate in gaining Mr. Berkx's experience from the previous meeting which he organized in The Netherlands.

Interest continues to increase; the recent Conference included a delegation from the U.S.S.R., and Spain, Brazil and Czechoslovakia were represented. On the other hand, delegates from India and East Germany, who attended in 1959, were absent. The papers presented originated from ten countries. Titles of more than one hundred were submitted, and this number was only reduced with some difficulty to about 50 by narrowing the field—to papers of direct relevance to the chemistry, physics and carbonization of the coal substance.

Since authors are submitting their papers to journals of their choice and proceedings of the Conference will not be published, the 53 papers presented will all be mentioned briefly, grouped under the three main headings used in the sessions. An independent summary by A. Ladam in the French language will be found in a late-1961 issue of *Chimie et Industrie*. A numbered list of references so far available has been appended.

Chemical Properties

P. H. Given[1] reviewed his proposed molecular model for coals in the light of more recent work on dehydrogenation, nuclear magnetic resonance, and other evidence; he concluded that the general features of the model had been confirmed, but indicated changes in structural detail that appeared desirable.

H. A. G. Chermin attempted to deduce from measured densities and elementary analyses the mean size and proportion of aromatic units in coals, and directed special attention to the accuracy possible. Corrections to previous attempts were made and quite good agreement with X-ray measurements of mean size was found.

H. S. Rao, P. L. Gupta, F. Kaiser and A. Lahiri considered the assignment of the band at 1,600 cm $^{-1}$ in the spectra of coals. This band could have one or all of several origins, and the results of reducing the coals with lithium aluminium hydride, since this did not cause a change in intensity in the band, were considered to discount assignment to a carbonyl vibration. On a related subject was an investigation, by L. Czerski and L. Czuchajowski, of the same spectral band in polycondensates of *o*-, *m*- and *p*-dihydroxybenzenes with formaldehyde. When the *para*-derivatives were oxidized with ferric sulphate the 1,600 cm $^{-1}$ band increased in intensity, possibly owing to formation of hydroxyl/carbonyl chelate structures, supporting earlier assignments of this band in coals to such structures.

M. T. Monaghan and K. Littlewood attempted to use trimethyl-acetoamminohydrazide hydrochloride (Girard's reagent *T*) to extract carbonyl-containing substances from coals as water-soluble derivatives (see p. 128 of this issue of *Nature*). M. Weclewska described the effect on eight coals of exposing them to a variety of organic vapours. Conclusions were drawn as to the variation with rank of free and hydrogen-bonded hydroxyl groups. P. H. Given, M. E. Peover and W. F. Wyss had examined the chemical reactions and properties of some petrological constituents of coals. Moderate differences in hydroxyl content and reducibility were found, the general molecular pattern being similar for all the macerals studied. B. K. Mazundar, S. Ganguly, N. Gopal De and A. Lahiri had investigated the effect of phosphoric and sulphuric acids on coal structure; they found that a constant proportion of the total carbon in the coal (92 per cent) was retained in the chars produced when the products were carbonized. Since extensive dehydrogenation did not result, an apparent condensation between the alicyclic structures and the remainder of the molecule was postulated to explain the inhibition of tar formation caused by the treatment. J. D. Brooks and T. M. Spotswood[2] discussed the reaction of carbonized coals with bromine and with sodium in various forms; the results were consistent with the presence of polycyclic hydrocarbon structures.

Several papers were concerned with oxidation or oxidation products. H. E. J. Brusset compared humic acids extracted from low-rank coals with those produced synthetically from polyphenols by oxidation; he adduced support for an analogy between these classes of material. Oxidation of coal in alkaline medium at 260° C. was described by J. E. Germain, J. Guillon and P. Delattre. The high yields of benzene carboxylic acids obtained were extracted with methyl ethyl ketone and subjected to chromatography. Fractions were characterized according to the number of carboxyl groups per benzene ring; increase in rank of coal was accompanied by a decrease in the mean number of groups per ring (about 4) and an increase in total yield of these acids. G. J. Lawson and S. G. Ward reported a further examination of the resolution of sub-humic acids (secondary oxidation products of coal) partly by means of ion-exchange resins. Several known acids were isolated, including some previously reported (for example, glycollic and mellitic acids) and two aliphatic acids containing nitrogen (nitrilotriacetic acid and oxalylglycine). B. Juttner[3] described the oxidation of coke with nitric acid followed by sodium hypochlorite and extraction with butanone. The yield of mellitic acid increased sharply between 600° and 700° C. carbonization temperature, and then fell slightly. A related topic was a description of the use of ozonolysis in research on coal tar, by P. G. Copeland. Oxidized pitch fractions and model substances were further decomposed with alkaline peroxide and/or permanganate in pyridine and the products were identified. Mechanisms were established from the work with models, but the products from coal tar pitch had not yet been identified

Reaction of coals with alkaline solution at 200°–300° C was found, by M Ihnatowicz[4], in many cases to increase greatly the agglutinating values observed when the products were later heated A strong hydrogenating action accompanying hydrolysis was indicated

Possibly the most novel work described was that of L A Herédy and M B Neuworth on a depolymerization of bituminous coal at only 100° C The coal was allowed to react with a labelled phenol–boron trifluoride system, depolymerization was recognized by substantially increased solubility in phenol Models were used to elucidate the reactions taking place With coal, cleavage of aromatic-aliphatic linkages and also interchange of aromatic units with phenol were both involved Some of the structural units were thus characterized in terms of analysis and molecular weight, and evidence of bridges other than *via* methylene groups was obtained, possible model structures for coal that would fit the evidence obtained were discussed E E Donath adduced the presence of polynuclear aromatic units in pitches from coal hydrogenation from a study of the ease of change in hydrogen content

Two papers considered processes that may occur during the formation of coals G Huck, J Karweil and K Patteisky[5] showed in an experimental study that only dynamic pressure is likely to accelerate increase in rank, and that spores are unsuitable as indicators of the temperature of formation I A Breger considered the 'coalification' of wood in uranium-bearing sandstones It seems that nuclear radiation has caused dehydrogenation and condensation, leading to effects similar to those produced by biochemical coalification

P Dath, H Renson and E H Grand'ry reported work on the influence of rank and petrological composition on the behaviour of coals in the Audibert-Arnu dilatometer and came to the conclusion that both are important A Ihnatowicz, M Lason and M Zyla had shown by treatment of coal with alcoholic potash and with pyridine, together with hydroxyl determinations and adsorption measurements, that the two treating agents used altered these properties in a similar manner Evidence that this was due to a mechanical loosening of the structure was obtained J D Brooks, J F Stephens and H Silberman[6] had examined the X-ray diffraction patterns and functional groups in chars from carbonized salts of brown coal The 002 band was shifted, and it was suggested that in brown coals this band may possibly arise from an interchain *d*-spacing Phenolic groups in the salt form were less-easily eliminated by heating than in the untreated coals B Roga surveyed Polish and international classifications of coals and suggested modifications

Physical Properties

S Ergun and M Mentser carried out investigations on the X-ray scattering patterns of ten anthracites and *meta*-anthracites Those of higher rank gave rise to three-dimensional reflexions, indicating that coal can graphitize during metamorphism Nuclear magnetic resonance techniques were applied by J Smidt, W van Raaijen and D W van Krevelen to show that the mobility of the protons in coals changes with rank, and that it shows a characteristic variation with temperature for the coking vitrinites The effect, on earlier published conclusions, of this variation was discussed. Pitches were also studied M Jacubowicz and J Uebersfeld described results obtained with several coals when studied by double magnetic resonance The nature of the interactions (dipolar, etc) between the electronic and the nuclear magnetic moments was determined, and a better understanding was achieved of the electron spin resonance ascribed to free radicals Some possibilities for studying adsorption were also mentioned

Two papers were concerned with the specific surface and heat of wetting of coals and carbonized coals S Prégermain, S Durif and P Chiche studied the adsorption of water, methanol and nitrogen on carbonized coals, and their low-angle X-ray scattering *Inter alia*, a relation was found between the ease of graphitization and the development of the internal surface L Robert and S Prégermain found a quantitative relation between heat of wetting in methanol, per unit surface of the carbonaceous solid, and its oxygen content, extrapolated to zero oxygen content the heat evolved is still considerable, and the chief effect, therefore, is to raise the estimated surface areas of high-rank coals and chars while leaving those of low-rank coals little changed J W Phillips reported on the self-adhesion of coal during briquetting without a binder The physical properties, and the structure revealed by photomicrographs, of the briquettes were linked with the stress and strain relations during the application of pressure with additional shear strain D H Everett, E Redman, A J Miles and D H Davies reported adsorption isotherms on chars made from polyvinylidene chloride Important differences in hysteresis, relevant to the mechanism of coal carbonization, were discussed

Reflectances of vitrinites carbonized at a series of pressures were reported by M -Th Mackowsky An attempt was made to relate the changes found with the chemical changes known to occur during heating L A Gilbert had determined refractive indices and absorption coefficients of polished surfaces of coals, in the ultra-violet region, by a polarized light method This was the first application of this method to coals and yielded valuable results All the vitrains used showed a strong aromatic-type absorption around 2600 Å S Ergun and J T McCartney[7] reported the refractive indices of ultra-thin sections of coals and graphite in the visible region and extinction coefficients in the ultra-violet and visible regions The results were tentatively considered to lead to conclusions regarding the aromatic units in coals similar to those derived from X-ray investigations

E de Ruiter, R Leutner and H Tschamler reported the electrical resistance of powdered coals under pressure and of their products of extraction by pyridine in relation to temperature Little change in the energy of electronic activation for coals was observed between 80 and 90 per cent carbon content, values of this energy were similar for the residues of extraction of solvent, but greater for the soluble products by extraction The results for the extracts were considered to accord with conclusions from X-ray diffraction

Thermal Decomposition

No less than four papers were concerned with the plastic softening of coking coals in the early stages of heating Rheological properties during the initial softening had been studied by H R Brown and P L Waters[8] They found that the temperatures of initial softening of a wide range of Australian coals were almost independent of rank within the range of 82–89 per cent carbon content, and that the softening was initially reversible, but maximum fluidity and solidification temperature were dependent on rank A medium-rank coal behaved as though the flow were Newtonian until the onset of active decomposition A mean activation energy of about 70 kcal /mole was estimated J C Macrae and K S Murthi[9] had determined, in a special cone viscometer, the variations of fluidity at a constant temperature below the active decomposition point, they interpreted these in relation to the microscopically observed porosity of the char after cooling and the amount of chloroform extract obtainable from this char The duration and magnitude of fluidity were found to be highly dependent on temperature, and the increasing fluidity before the maximum to be directly related to the dilation of the mass with gas bubbles, the amount of chloroform-soluble material present did not change materially over the same period and therefore was considered unlikely to produce this increase

I G C Dryden and W K Joy[10] had investigated the provenance of the fusible chloroform-soluble material in heated coals, by comparing similar materials obtained in three independent ways They concluded that this fusible material is partly present in the unheated coal and partly formed or disengaged during heating, the proportion originally present increasing with increase of rank up to 100 per cent in prime coking coals Evidence was also presented leading to the conclusion that the portion originally present is also more resistant than the remainder to thermal decomposition The plasticity developed was considered, on limited evidence, to depend critically on the concentration of fusible material—not entirely in agreement with the conclusions of Macrae and Murthi A D Dainton demonstrated by static beam-bending methods that visco-elastic behaviour persisted in the semi-coke from a coking coal above the commonly accepted point of solidification for the plastic coal, that is between 480° and 800° C

Development of the fissures in coke that result from shrinkage, following resolidification of the plastic mass, was studied by H E Blayden, H C Wilkinson and G E Oatley in relation to the temperature distribution in an experimental coke oven A clear correlation between shrinkage and fissuring was observed, and these authors also concluded that semi-cokes may show visco-elastic behaviour G H Taylor[11] reported the appearance in both reflected and transmitted light of coals at various stages in carbonization Colour photomicrography was an important feature of the techniques used Development of an optical mosaic structure from the plastic vitrinite was observed The behaviour suggested that the resolidification of coke is analogous to a crystallization process H Pichler and D E Lee[12] reported the effects of extracting a bituminous coal for various times with tetrahydrofuran The consequent changes in plastic behaviour, dilatometer curves, volatile matter and other characteristics were described W F Landers and J E Goodman had investigated the effects of temperature and gas pressure on the tar obtained from a lignite Increased susceptibility to decomposition of the tar liberated between 500° and 600° C was evident, and this was further increased by pressure

S Černič reported an investigation, with the help of labelled pyrite, of the behaviour of organic and inorganic sulphur-containing constituents of a series of coals during carbonization Evidence was obtained that inorganic and organic forms of sulphur were interchanged to some extent, according to the rank of coal, during the thermal decomposition The effectiveness of carbonizing in hydrogen, ammonia and pre-heated steam, in reducing the sulphur content of the resulting coke or char, was also investigated, steam proved the best

Heats of coking formed the subject of three papers, the definition used must be considered when making comparisons D Fitzgerald reported coking heats for an anthracite and several low-rank coals An isothermal fluid bed calorimeter was used for the measurements The poor agreement between results of other work was critically discussed C Meltzheim, J Lahouste and A Boyer had made a direct comparison of two methods of measuring the heats of carbonization, and found them in satisfactory agreement The net heat of carbonization over the whole range of temperature, for a number of coals, was always exothermic, the value varying with rank in a complex manner in the region of 30–170 (± 40) cal /gm C Kroger and J J. Das[13] had investigated the net heats of carbonization of individual macerals by direct calorimetry The heats were not directly related to the yields of volatile products A relation between the decomposition heat up to 500° C and the hydrogen/oxygen ratio and the carbonyl content of the coals investigated was, however, found At 1,000° C vitrinite appeared to give the lowest heat values of the three macerals studied

The rate of evolution of volatile matter from coal, during carbonization in a fluid bed with sand as heating medium, was interpreted by G J Pitt on the assumption that the coal is a complex mixture, each component of which decomposes independently by a first-order reaction He showed that this assumption can lead to the linear change with logarithm of time observed, and with this assumption deduced from the results a distribution of activation energies (35–75 kcal /mole, maximum at 50–55 kcal /mole)

A continued investigation of the pyrolysis of model compounds believed to resemble coal was reported by D W van Krevelen and H W den Hartog[14] Polycondensates in which aromatic and non-aromatic structures (or oxygen atoms) alternated, prepared with labelled formaldehyde, were pyrolysed, from the weight, and analysis of and distribution of radioactivity in the products, conclusions were drawn about the influence of structure on the degree of (temperature) overlap in tar and gas evolution and on the weight loss–temperature curves, and it was concluded that C—O bonds decomposed more readily than C—C bonds

In the next group of four papers, the work described had been directed towards the establishment of relations between volatile products of the pyrolysis of coal and the chemical structure of the coal itself G Claxton described work on the genesis of aromatic hydrocarbons using gas-liquid chromatography In a coke oven, the peak evolution of non-aromatic hydrocarbons occurred earlier in the heating process than the peak for benzene formation, significant effects of the heating-rate were observed In laboratory experiments more detailed information was obtained A Ladam, R Ferrand, P Payen and A Boyer had studied the constituents of low-temperature tars (550° C) from vitrinite and exinite concentrates, using vapour phase chromatography Normal paraffins and olefines arose almost entirely from exinite, and the results suggested that as much as 10 per cent of the exinite used may consist of chains with about 30 carbon atoms, correspondingly, aromatic compounds from exinite tar were more highly alkyl-substituted than those from vitrinite tar W Waddington had compared the relative abundance of isomeric forms in tar with that to be expected from the postulated thermal reactions of a proposed structural model He suggested that the results obtained support the view that coals contain in part a 6 alkyl-4 propyl-2 methoxy phenol type of structure, this may be gradually converted to other structures by thermal/pressure reactions during coalification C Kroger and R Brucker[15] reported results from high-vacuum pyrolysis of coals and discussed these in relation to the coal structure Products in the range 300°–575° C were examined by gas chromatography and other methods Rate constants and activation energies for the evolution of hydrogen, many simple hydrocarbons and the carbon oxides were estimated, and from these in turn, by means of allocation of reactions to structural elements on certain assumptions, quantitative parameters for 17 elements of structure, such as the proportion of aromatic carbon in the coal, were deduced

There proved to be a shortage of time for formal discussion, and on the other hand many delegates remarked on the value of spontaneous extra-mural discussions Further experiment is clearly necessary in an attempt to correct this lack of balance It is hoped that, since these conferences continue to produce more novel material than the average delegate can comfortably digest, further innovations will be made at the next conference, to be held at Cheltenham during 1963

BIOCHEMICAL ENGINEERING

A SYMPOSIUM on "Biochemical Engineering" was convened by the Institution of Chemical Engineers on May 30 , it is doubtful whether any two of the participants, lucid as they were on their own topics, would have agreed on a definition of the title Though, on one hand, one may assume unanimity of outlook in chemical engineers, the term 'biochemist' has been used by many disciplines, from the quantitative biologist to the organic chemist by way of the medical analyst Moreover, in the fields where engineers encounter Nature in the raw, ought not such a title to be amplified to 'biological chemical engineering'? It is easy to see how confusing such exercises in labelling can be, though there is always a stimulation of interest and research by collecting certain topics together under a high-sounding title, however arbitrary

Nevertheless, many industries are now based on the controlled use of biological processes (Strangely enough, the largest industry of this type, brewing, was already developed more or less to its present size before the terms 'biochemist' or 'chemical engineer' existed) It was the production of antibiotics by fermentation, especially under the high pressure of the Second World War, that brought a variety of biological interests (botanists, zoologists, pharmacists, agriculturists, entomologists—for there were very few true biochemists, by any definition, available at the time) face to face with the engineer (rarely of the 'chemical' variety) The difficulties of communication were considerable and were overcome the hard way It was also realized that similar problems existed in the food preservation industries and the sewage and effluent disposal services To help with these problems, the establishment of courses in 'biochemical engineering' were proposed—seldom, however, with any clear idea of what the graduates should do afterwards, although the vague idea of a superman who could control both sides of the industrial scene may have been in the minds of some proponents The problems were considerable, for whereas most of the engineers' deficiencies were conceptual and philosophical, most of the biologists' were factual and mathematical Making good the former must have seemed easier or, perhaps, they were not so apparent and the new discipline became, at least for a time, the protégé of chemical engineering

Two difficulties then faced the new dispensation first, that with normal chemical engineers at a premium, the supply of new graduate output could not hope for many years to affect the position ; second, that with the enormous rate of growth of each parent topic, no person could hope to keep up to date in both biochemistry and chemical engineering It was clear, therefore, that for many years to come the two functions of engineer and biologist would have to be realized by specialists in each discipline working side by side as separate entities It was with this aim of bringing together the two groups that this symposium was called

In the opening paper Dr D J D Hockenhull reviewed the formal aspects of the production of economically desirable products from micro-organisms He stated, as an axiom, that the primary function of a living organism is to reproduce itself It does this by a complex interlinked system of biochemical reactions on the nutrients supplied to it Interference with these processes may lead to the accumulation of intermediates or of alternative products derived from them Industrially important examples of such interference were unbalanced nutrition (acetic acid), deficient aeration (alcohol), mineral deficiency (citric acid), use of trapping agent (glycerol) or of foreign precursors (penicillin) or inborn error of metabolism (lysine) It was pointed out that these 'primary colours' of metabolic interference, in Dr G L Solomon's words, were most usually applied in combination to-day to obtain the best results A more detailed account of the biosynthesis of penicillin was then used to illustrate the concept of controlled fermentation In the early days, it used to be sufficient to choose an appropriate medium, inoculate it with the organism and leave the fermentation to proceed under set conditions until the time for collecting To-day, it has been found that strict control of *p*H value, sugar-level and the rate of supply of nutrient are all essential for maximal yield Such control brings fresh problems for the engineer in the design of suitable equipment Sensing devices capable of withstanding the conditions of sterilization and of operating satisfactorily in fermentation broths are needed It is particularly important in this context that the biochemist and the engineer should have a true appreciation of each other's problems

The engineering problems associated with large-scale fermentations are mainly those of designing a bacterium-tight fermenter and supplying it with large quantities of sterile air Then there are the associated problems of finding the best methods of aerating and agitating the fermentation broth to promote maximum yields of antibiotic and elimination of the foam that frequently occurs

Other papers were concerned with more specific problems The highly aerobic fermentations, as used for production of penicillin and streptomycin, present their own problems of aeration and agitation Not only must the air supply be sufficient to provide all the oxygen the organism requires but it must also strip the fermentation broth of carbon dioxide which becomes toxic if allowed to build up to a high concentration Agitation is necessary, first, to break the air into small bubbles, thus presenting a large surface area to the broth, and, second, to provide the shear action that aids mass transfer Other functions of agitation are to keep solids and mycelium in suspension to ensure that the fermentation broth is of uniform composition Good mixing is also important for close control of temperature Efficient agitation also breaks down the mycelium and prevents it growing into large aggregates or clumps

Two papers were presented on the separate aspects of aeration and of agitation of fermenter broths Prof P H Calderbank, in his third paper on physical rate processes in industrial fermentations, examined the rate of mass transfer from the liquid to solid particles suspended in mixing vessels An attempt was made to simulate a mycelial suspension by the use of screened ion-exchange resin particles The rate of mass transfer was assessed by introducing the acid form of the resin into a dilute sodium hydroxide solution and noting its rate of change of *p*H with time under the desired conditions of agitation and aeration A serious restriction in transfer occurred if the solid were allowed to aggregate into large clumps The process of liquid-to-solid mass transfer seemed to be rate-determining in many industrial fermenters

Dr N Blakebrough considered aeration and agitation from a different point of view, using a photographic technique developed to examine patterns of flow in a mixing vessel The importance of work on flow-patterns, for large-scale operations, is not so much to find out the actual distribution of velocity but rather to confirm that the broth in all parts of the fermenter is being agitated so that no stagnant zones exist

Both Prof Calderbank and Dr Blakebrough approached their problems as chemical engineers They had used bench-scale apparatus with low-viscosity Newtonian liquids, very different from the viscous non-Newtonian broths often used in industrial fermentation practice and requiring agitation and aeration in vessels of, say, 10,000 gal capacity It is to be hoped that, in future, more work will be directed towards the study of non-Newtonian liquids, and that some indications will be obtained on the methods of scale-up needed for predicting with confidence the degree of mixing in a large fermenter

In aerobic fermentation of pure cultures, sterility is a special problem as the volumes of air involved are large For example, a fermenter of, say, 10,000-gal capacity could be fed with 1,000 cu ft /min air In industrial practice absolutely sterile air can rarely be obtained A compromise is made between the effectiveness of the sterilizing treatment and the detrimental consequences of an infection For design purposes, a penetration of 1 in 10^{12-13} has been suggested , that is to say, out of every 10^{12-13} organisms in the air presented to the sterilizing device only one should pass through into the fermenter

In laboratory-scale work the most common way of sterilizing air is to pass it through a cotton-wool plug or an absorbent filter On the large scale, filters of glass wool, slag wool or powdered carbon are generally used Some form of air heater may also be used The main interest in Mr R Elsworth's paper lay in the demonstration that sterilization by heat to kill infecting organisms can be considered as a simple chemical reaction the rate and extent of which can be predicted from an equation of the Arrhenius type When absolute sterility is not essential, the information presented in this paper can be most useful for determining the time/temperature relationship necessary for a desired penetration

In the laboratory, experimental work to improve the performance of a fermentation is normally carried out with shaken conical flasks , this is the cheapest way of finding out the effects of variations in the strain of organism or the medium used to grow it, for replicate cultures are easy to set up However, the characteristics of aeration and agitation in shaken flasks are very different from those in conventional deep fermenters Intermediate development work is therefore also carried out in bench-scale fermenters having a capacity of about 1 gal , and in pilot-plant units of several hundred gallons capacity

Dr A Parker presented a paper on equipment for such laboratory and pilot-plant scale fermentations After a brief review of the literature of this subject, he divided his paper into two parts, the first dealing with laboratory-scale vessels of 5-l capacity and the second with 220-gal pilot-plant fermenters The wide diversity of engineering problems associated with the design of fermenters clearly illustrated the relationship between the engineering designer and the biochemist using his equipment. Another point made was the great similarity in fermenter design regardless of its size Particular attention was needed in the design of agitation-shaft glands, the techniques of aseptic sampling and the transfer of seed cultures Rates of oxygen transfer, as measured by the sulphite method, were given for the fermenters described, under various conditions of agitation and air flow Sulphite oxidation-rates could not necessarily be correlated with actual fermentation results, but they did serve as a useful index of performance and were also helpful in comparing different agitation systems.

Aeration processes for the biological oxidation of waste waters were described by Mr A L Downing In effect, the activated sludge process is a very dilute fermentation The whole process must be carried out as cheaply as possible Various devices used for aerating the waste liquors were described, such as the induction of air through a Venturi tube and the use of a submerged impeller and sparger The effects of bubble diameter and depth of liquid through which the bubbles travel were also studied in tap water containing 5 p p m anionic surface-active agent The effects of surface-active agents on mass transfer were found to depend on the method of aeration As would be expected, the rate of absorption was roughly inversely proportional to the bubble diameter, and the oxygen absorbed per unit consumption of energy tended to decrease with increased depth of liquid

The shortness of the Symposium imposed very strict scheduling and handicapped free interchange of opinions The discussion was held back until several principal papers had been given, and this led to some 'cooling off', which was also encouraged by the separation of question and response There was a tendency for many of the contributions to be too restricted in scope and lacking in general philosophical content Perhaps this is a way of saying that they were too specialized for one-half of the audience Again, a contribution on equipment design, or even some account of the problems associated with it, even to such special details as design of valves, sampling devices, probes and electrodes, might have brought a little more practicality and scope for argument

The meeting, although demonstrating clearly that biologists and chemical engineers speak rather different languages even when working on the same processes, did indicate that the barriers are not impassable Moreover, who knows, in crossing the perilous mountains between the two disciplines, one might come across that 'abominable noman', the biochemical engineer The proceedings of the symposium are to be published in *Transactions of the Institution of Chemical Engineers* D J D HOCKENHULL

COSMIC RAY RESEARCH IN LATIN AMERICA

THE third Latin-American conference and course on cosmic ray physics was held in Mexico during June 26–July 5 It was arranged by Profs M S Vallarta and J Roederer on behalf of the Latin-American Council for Cosmic Ray Research under the auspices of Unesco, the Mexican Nuclear Energy Commission, and the U S Space Science Board

The meetings were held at the University of Mexico, famous for the elegance of its remarkable architecture, and at the headquarters of the Nuclear Energy Commission There were present some 25–30 representatives from Argentina, Bolivia, Brazil, Chile, Mexico, Peru, the United States and the United Kingdom The course consisted partly of original contributions and partly of lectures of a review nature The topics covered in the lectures included the nature and origin of the galactic cosmic rays and solar-produced high-energy particles, the intensity variations of the galactic radiation and their relation to solar activity and the structure of the interplanetary magnetic field, the motion of primary cosmic rays in the geomagnetic field, the properties and origin of the Earth's radiation belts, and solar radio astronomy

The Latin-American countries between them operate a chain of neutron monitors covering a wide belt of latitude from Mexico in the north to Ellsworth in Antarctica, and a good deal of the original work reported at the meeting was concerned with the analysis and interpretation of the data from these stations

In particular, the remarkable cosmic ray intensity variations during July 1959 and November 1960 (when there were examples both of decreases in the intensity of galactic particles and of injection of additional low-energy particles by the Sun) have been very carefully analysed by the Argentinian, Bolivian and Brazilian groups In discussing the events of November 1960 the Argentinian workers arrive at the conclusion that the main intensity increase starting at 1930 U T on November 12 was due to the envelopment of Earth by a cloud of magnetized solar plasma containing trapped solar particles generated by the 3+ flare which began at about 1330 U T on that day They also conclude that the presence of the magnetic field associated with the plasma was responsible for producing the decrease in intensity of the galactic cosmic rays observed at this time They attribute the increase in intensity of solar particles between 1330 and 1930 U T, prior to the main increase, to leakage from the trapping field in the plasma

The Bolivian group, which operates the extremely well-appointed laboratory at Chacaltaya (altitude 5,200 metres above sea-level) includes in its cosmic ray activities the study of both large air showers and intensity variations related to solar processes Included in the work reported by this group was an account of the rapid, short-lived intensity decrease observed on November 13, 1960, by means of its neutron monitor, which has the very high counting-rate of $\sim 5 \times 10^5$ per hr Immediately after the magnetic storm sudden commencement at 10 hr 21 min U T on that day, the cosmic-ray intensity started to decrease and shortly after 1300 hr U T it dropped suddenly, remaining 3 or 4 per cent below the general prevailing level for about 1¼ hr, after which it returned suddenly to the pre-drop value Analysis of data from other stations showed that this phenomenon happened on a world-wide scale, and the Bolivian group concludes that this kind of modulation of the galactic cosmic-ray intensity could only be produced if the solar plasma contained a very well-defined region of relatively high magnetic field strength

The work of the cosmic ray group in Santiago at the University of Chile, reported by Prof G Alvial, is principally concerned with the investigation of the primary cosmic rays using nuclear emulsion techniques, and he described work which has been carried out on charge determination of heavy nuclei in a stack of *G*-5 emulsion exposed at 131,000 ft over Minnesota Charge determination by two methods gives agreement to better than one unit One particle has been found with $Z = 30$

Mrs R Gall, of the Institute of Geophysics, University of Mexico, gave an account of the work carried out there by the theoretical group on the trapping of charged particles in the geomagnetic field and on the relation between the radiation belts and the inner allowed region of Stormer Work is also being carried out on the motion of cosmic ray albedo particles in Earth's field and on the changes in threshold momenta resulting from the secular variation in the geomagnetic field At some points on Earth's surface these changes have amounted to as much as 25 per cent during the past hundred years

This course, which is a biennial event, provides, in addition to the presentation of original work and review lectures, a forum for the discussion and co-ordination of future programmes in cosmic-ray research in the participant countries The two previous courses were held in La Paz, Bolivia, and San Carlos de Bariloche, Argentina, and it is intended that the next one should be held once again in Bolivia In a report of this length it has only been possible to select a few representative aspects of the work reported by the Latin-American groups

PHARMACEUTICAL CONTROL IN BRITAIN

In his chairman's address to the British Pharmaceutical Conference, held at Portsmouth during September 18–22, Dr D C Garratt states a case for a more effective control of the quality of medicinal substances Drugs not governed by official standards should not become available to the public except under a notification scheme, similar to that already in force for pesticides, so that their clinical characters and standards of purity, with appropriate methods of analysis, would have prior approval Standards for all medicines should be enforced by testing in regional laboratories specialized for the purpose and maintained by the Ministry of Health For reputable approved firms, the contractor's own inspection organization could be given the initial responsibility for compliance of goods with specification The pharmaceutical analysis involved should be admitted as a distinct discipline, by the institution of special training courses and recognized qualifications

At present, control analysis is too often rendered pointless by insufficient attention to the precision of the methods involved, and for a full realization of the potentialities of such techniques as, for example, ultra-violet spectrophotometry, a national collection of standard specimens of authentic materials of known impurity content is essential Authority for the enforcement of those standards should be incorporated in an Act of Parliament

It should be every analyst's concern to consider what can be done to reduce costs of examinations, for example, by using equally effective, but cheaper, solvents, by applying rapid instrumental techniques or, where possible, by replacing costly bio-assay investigations by simpler paper chromatographic techniques

Dr Garrett suggests that the public would receive better protection if the control of drugs were divorced from the present Food and Drugs Act and incorporated in a new Medical Substances and Preparations Act built around Sections 11, 12 and 13 of the Pharmacy and Medicines Act Imported drugs should be subject to stringent examination by analysts of acceptable status Such status might be conditional on the possession of a special diploma incorporated as a requirement of competence in the proposed Medical Substances and Preparations Act Examinations for such diploma qualifications would be conducted by those chemical or pharmaceutical institutions approved by the Ministry of Health

THE LABORATORY OF THE GOVERNMENT CHEMIST

The very varied work done in the Laboratory of the Government Chemist during 1960 has recently been reported* The Laboratory, which forms part of the Department of Scientific and Industrial Research, exists to provide a service to any Government department that requests it on matters broadly concerned with chemistry, and more particularly with chemical analysis The Laboratory is the oldest Government chemical institution in the Commonwealth It was created in 1842 by the Board of Inland Revenue, principally to assist the revenue authorities in detecting and preventing the adulteration of tobacco with worthless additives The special responsibilities which the Laboratory retains to H M Customs and Excise are highlighted by the number of samples received from this authority Of a total of 327,460 samples examined and reported on by the Laboratory during the year, no less than 280,125 were submitted by H M Customs and Excise These samples cover a wide range of dutiable commodities such as wines, beers and spirits, sugar, textiles, fuel oils, etc

The statutory duties of the Government Chemist under the Food and Drugs Act, the Fertiliser and Feeding Stuffs Act, and the National Health Act, involve the Laboratory in such work as the analysis of orange juice, dried milk, fertilizers, pesticide chemicals and formulations thereof, pharmaceuticals and drugs, canned foods Examples of the variety of this work are the determination of glycogen in oysters and the iodine content of school dinners

An organization which exists to provide an advisory service must carry out a considerable number of routine analyses as, for example, on the variety of materials purchased by various Government departments , this work varies little from year to year

Important work from the public health point of view concerns the examination of water and sewage Much attention is given to the control of fluoridation in municipal supplies (where this is practised) The control of micro-organisms in the Serpentine bathing area is an item of special interest to Londoners.

* Department of Scientific and Industrial Research Laboratory of the Government Chemist Report of the Government Chemist, 1960 Pp iv+79 (London H M S O , 1961) 5s net

The Laboratory of the Government Chemist is very often involved in legal cases arising out of such illegalities as the dilution of beer, illicit distilling and forgery The present report gives some excellent illustrations on the methods used to detect forgeries

Although mainly concerned with the utilization of existing analytical methods, the Laboratory carries out a considerable amount of research work on the improvement of analytical methods and their adaptation to meet problems peculiar to the types of sample received for analysis The report also indicates that the small but increasing research programme on the development of new methods of analysis is meeting with considerable success The new radiochemical section has begun work for municipal water supplies, and on the analysis of effluents from atomic energy establishments

This report shows admirably that as a means for safeguarding the public interest over a wide field of activity, the Laboratory is second to none This report has been read with considerable interest not only for its scientific content but also for the extreme diversity of its contents The new Government Chemist, Dr D T Lewis, is to be congratulated on the presentation of this, his first report

William I Stephen

AMSTERDAM CONFERENCE ON PARTICLE ACCELERATORS

THE January number of *Nuclear Instruments and Methods** is devoted entirely to the proceedings of the Second Accelerator Conference which was held in Amsterdam during October 4–6, 1960 The Conference, which was sponsored by the High Voltage Engineering Corporation, Burlington, Massachusetts, and High Voltage Engineering (Europa) N V, Amersfoort, The Netherlands, consisted of four sessions, under the chairmanship of Profs H Brinkman (University of Groningen), H H Staub (University of Zurich), K Siegbahn (University of Uppsala) and A Charlesby (Royal Military College of Science), respectively The seven papers in the first session were devoted to nuclear physics, and dealt with resonance reactions, the generation of positrons in a thick target, desirable linear electron accelerator characteristics for nuclear research, Coulomb excitation, experiments using ultra-fast pulse techniques, nuclear widths and life-times, and colliding beam techniques Three of the six papers in the session on particle research discussed tandem accelerators P H Rose of the High Voltage Engineering Corporation described two forms of the three-stage tandem accelerator, one with negative ion injection and the other with neutral beam injection H E Gove of the Atomic Energy of Canada, Ltd, gave an account of the tandem accelerator installation at Chalk River and of two particular fields of investigation during 1960 The Chalk River accelerator began operating in February 1959 and has operated continuously on a two-shift a day, five-day week basis since then The first investigation was concerned with the interaction between beams of heavy ions such as carbon-12, nitrogen-14 and oxygen-16 with targets of nitrogen, oxygen, fluorine, neon, magnesium, aluminium and silicon, and the second with measurements of spins of levels in even-even nuclei lying between oxygen-16 and calcium-40 Recent research work carried out at the Atomic Weapons Research Establishment, Aldermaston, on nuclear reactions using a tandem accelerator and 6-MeV electrostatic generators was described by K W Allen Oxygen ions accelerated in the accelerator to energies of 10–40 MeV were used for Coulomb excitation of energy-levels in both rotational and vibrational nuclei and for the measurement of nuclear life-times by Doppler-shift methods. The final paper in the nuclear physics session was given by J C Nygard and R F Post on recent advances in high-power micro-wave electron accelerators for physics research

The third and final sessions were devoted to physics and radiation research The subjects covered included the use of Van de Graaff accelerators, pulsed neutron sources and ion sources In the industrial applications section, the use of the electron accelerator in solid-state physics, and of high-energy radiation in biochemical and microbiological research were discussed by P Baruch, and S T H Pinner and W T H Davison, respectively The report of the proceedings concludes with a most impressive and long list of accelerators (Van de Graaff, micro-wave linear electron and Cockcroft–Walton) which have been installed in various centres all over the world by the High Voltage Engineering Corporation, and associated companies

CONTINENTAL AND OCEANIC DIFFERENTIATION

DR ROBERT DIETZ'S recent article[1] is a marked contribution to what might be called the oceanographic revolution in geotectonics One gets the impression that with it a stage has been reached like the last but one in fitting together a jigsaw puzzle, with the various parts of the puzzle having been laboriously assembled, piece by piece, at last seeming to look as if they are all part of one single picture

What Dr Dietz has done, effectively, is to combine the notions derived from the recent discovery of oceanographers of mid-oceanic rift ridges and transcurrent faults, with the older pictures, derived from earthquake and gravity measurements, of the pushing up of continental edges along conical thrust faults exposing themselves as mountain ranges, island-arcs and trench systems, according to the ideas of Meinesz and van Bemmelen, and set out specially by Tuzo Wilson The leading new idea, linked with the still hypothetical mantle convexion systems, is one of expanding oceanic floors, split vertically by latitudinal and circumoceanic transcurrent faults, passing under the continents This removes many difficulties and makes it possible to envisage a mantle which can expand under some parts of the crust and contract under others at the same time

Two major difficulties, however, are still left, and it is to these that I wish to direct attention. In the first place, the general acceptance of an asthenosphere ranging from depths of 120–200 km. below the surface of continents and 70–200 km. below that of oceans does not fit with the presence of deep-focus earthquakes ranging down to 800 km. in depth, with a continuity of thrust planes, marked by their epicentres, with those of the shallow-focus earthquakes. This would seem to imply that it is not only the lower crust, the lithosphere, in Dietz's sense, that moves with the continents but also a rigid upper mantle down to about 900 km., below which the heavier material of reduced density 4 and some degree of plasticity seems to predominate.

To be consistent, the expansion of the oceans must occur down to this depth and from it, too, must proceed the material which by successive crack filling provides for the extension of the oceanic floor and for submarine vulcanicity and particularly for extensive basaltic flows and intrusions. This basaltic material may not derive directly from the lower mantle but may be, so to speak, pumped through the cracked crust from the asthenosphere by the buckling of the upper mantle due to the pressure of the convection currents beneath it. This process, as Gaskell has pointed out, is likely to occur catastrophically rather than continuously and its effects disappear in time by subsidence.

The difficulty of reconciling these two sets of facts turns on the rheological properties of the asthenosphere. It is clearly not a liquid or shear waves would not be transmitted at all but, also, evidently it admits easy creep for earthquakes never originate there, in contrast to the rigidity of the layers above and below it. One possibility is that it is crystallographically heterogeneous in which some minor constituent may be melted thus giving it physical properties similar seismically to poorly consolidated sediments. Such a paste sandwich held between rigid rock above and below might well admit both 45° thrust planes and vertical transcurrent faulting as one rigid body. It may also be that the reason why its upper limit lies higher under the oceans than under the continents is because it is actually hotter there owing to upward convection. The apparent equality of flow of heat through continents and ocean beds might well be an almost accidental compensation, the continental masses making up by their greater radioactive content for the heat flow due, under the oceans, to the closer approach of heated material. These speculations might be amenable to test by heat-flow studies on continental margins and oceanic rifts.

The second difficulty is older and more fundamental. It touches the mechanism of the geochemical differentiation between the sima of the ocean beds and the sial of the continents. Apart from an entirely hypothetical solution like the extraction of the Moon from the Pacific basin, it would seem that this is the result of a progressive tangential concentration of sialic material. Continents seem to grow on their active oceanic margins by the pushing in of an undifferentiated crustal material. But how does the mechanism which Dietz invokes, of the sloping under of the ocean floor, transfer its sial content to the base of the crust? Here, I think, more geochemical analysis is necessary. Something might be found by comparative analytical studies of the clearest example of this under-thrust which occurs in Central America where the Pacific type blocks appear to have been pushed right under the Cordillera of the isthmus and come up again in the Antillean arc, limited by the great transcurrent faults of Cuba and Trinidad.

On both these questions of the real depth of the continental blocks and of the concentration of aluminium in these and not in the oceanic block, experimental methods, both chemical and mechanical, as well as observation and analysis should have a part to play.

J. D. BERNAL

Birkbeck College,
University of London.

---

[1] *Nature*, **190**, 854 (1961).

REGARDING Prof. J. D. Bernal's communication, I am pleased to learn that he finds the concept of ocean floor spreading, marking the top of mantle convection cells, at least generally palatable.

Regarding the question of deep-focus earthquakes, I am inclined to favour the idea of the lithosphere extending to about 70 km. both under the continents and ocean basins. This is, of course, derived from isostatic evidence. Below this level, in the asthenosphere, permanent stresses seem not to accumulate. Deep-focus earthquakes down to 800 km. apparently indicate that stresses do accumulate for short periods of at least a few years, but this does not prove their accumulation for thousands or millions of years. Hence deep-focus earthquakes do not disprove the existence of an asthenosphere at moderate depths. As Bernal emphasizes, much depends on the rheological properties of the mantle substance, about which little is known. To describe it as a viscous solid, as a quasi-liquid, etc., must all fail as adequate descriptions.

I agree with Bernal that the apparent equality of flow of heat through the continents and ocean basins may well be a matter of accidental compensation. The surprisingly high flow of heat from the ocean floor with poorly radioactive rocks may be explainable by convection, whereas the heat flow from the highly radioactive granite rocks of the continents must depend on diffusion.

Regarding the sialization of the continents, I visualize that the sima, rising from the deep mantle, contains some juvenile sialic material. By spreading, this 'sial-sima' is eventually slid under the continents. On subsidence of the sima beneath the continent, the sialic fraction gets largely squeezed out (gravitationally differentiated) and is plastered to the underside of a continent. Hence the suggested origin of sial is much like the generally accepted origin of juvenile water. But the mantle substance would tend to be dewatered at the convection cell divergence while it would tend to be de-sialized at the convergences which are necessarily under the continents because of continental drift to the convergence zones. At present, the process seems especially operative around the Pacific, where the mantle seems to be slipping under the continental block and not coupled with it, in contrast to the Atlantic. This added new buoyancy would help account for the recent epeirogenic uplift of the Pacific margin. Thus, I support the concept of new sial being added mostly under the continental block rather than merged laterally and annularly as Tuzo Wilson believes.

ROBERT S. DIETZ

U.S. Navy Electronics Laboratory,
San Diego, 52,
California.

WITH most of Dr Dietz's comments on my note I am in agreement In particular, I find his answer to my second objection, namely, the formation of sial by scraping and squeezing out of undifferentiated 'sial-sima' through the sliding under of the oceanic basement most illuminating

However, I must still take issue with him on the nature of the upper mantle as witnessed by the existence of deep-focus earthquakes These cannot, in my opinion, represent merely temporary accumulations of stress in a long-term easy creep material. The location of the conical 45° failure zones must be at least as old as the system of deep sea trenches, island arcs and continental mountain systems they underlie True, they appear to shift discontinuously by distances of the order of 200 km as each phase of the orogenic cycle comes into play However, as Van Bemmelen has demonstrated, the sequence of four parallel thrust planes in the Indonesian arc system goes back at least as far as the base of the Secondary, a period of two hundred millions of years The most natural explanation of this phenomenon may be similar to that of the development of Luders lines in plastically deformed metals, with old zones of failure hardening up and passing the critical stress on periodically to undistorted material It seems to me, in any event, somewhat perverse to attribute events occurring 800 km down in the mantle to causes located in the first 50 km from the surface, the reverse seems much more likely If this is so the downward moving convection current under the continental margins might be pictured not as a flow of liquid against a gravitational field through a rigid and highly compressed rock layer, but rather as a displacement downwards of successive blocks of the upper mantle into the presumably secularly softer material of the lower mantle (Fig. 1) Asthenosphere material could thus be imagined as separating into an upper hardened sialic layer under the continental edge and a lower hardened simatic layer filling in and overlying the depressed former upper mantle surface (Fig 2).

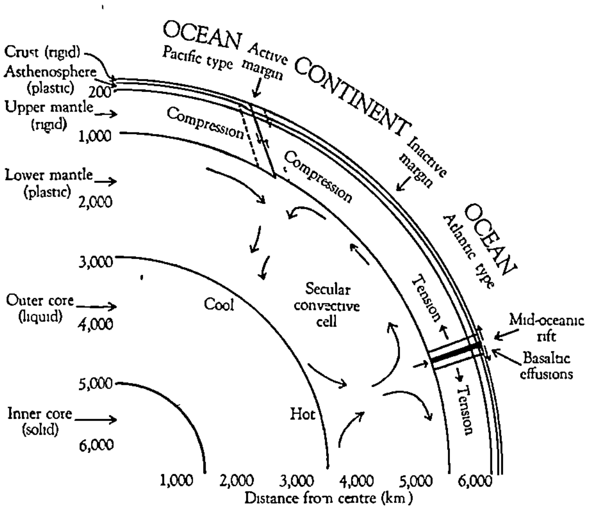

Fig 1 Schematic Earth section showing one secular convection cell in plastic lower mantle and its reactions on the more rigid upper mantle and through the asthenosphere to the crust On the right is shown, corresponding to rising mantle current, a mid-oceanic rift through which magma derived from the lower mantle, directly or indirectly, exudes to the surface through successively opened and consolidated tension cracks On the left is shown, corresponding to a sinking mantle current, an advancing continental edge with trench and mountain building system with the oceanic side of the upper mantle block thrust down into the lower mantle Between is the inactive continental edge marked only by an increased thickness of the crust and the corresponding thinning of the asthenosphere

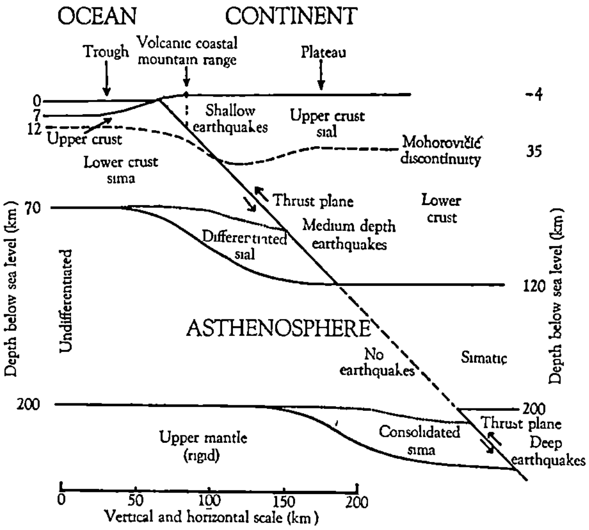

Fig 2 Section of an idealized continental thrust plane system illustrating Dietz's hypothesis of continental sialic differentiation The upper block of asthenospheric sial will in the actual case not be so clearly demarcated from the basal crust as is shown, nor will the corresponding block of sima with the sinking upper mantle The former, as it is differentiated, tends to rise vertically to jam with, and push up, granite batholiths The vulcanicity associated with the mountain building is assumed to arise from the activity of the thrust plane itself

These remain very tentative suggestions but may serve to pull together in one coherent whole the evidence derived from recent geophysical and oceanographic studies J D. BERNAL

IN two recent papers R S Dietz[1] and H H Hess[2] have made similar proposals in which, guided by new discoveries made about palæomagnetism and the ocean floors, they have combined features of several older theories into one which appears to fit many observations J D Bernal has welcomed these views (first communication) and commented on particular points and I should like to do the same

Essentially, Dietz and Hess agree that major convection currents flow in the mantle, as long advocated by Arthur Holmes, F A Vening Meinesz[3] and many others

These currents are held to rise under the active mid-ocean ridges and sink under the belts of active mountains and island arcs which lie along some continental margins The locations of these are well known and so it is possible to sketch on a globe the approximate directions of motion of the upper surfaces of these currents flowing from the mid-ocean ridges towards the active continental mountain systems

Mid-Ocean Ridges

A current rising under the mid-Atlantic ridge provides an explanation for the earlier views of A Wegener[4] and A L Du Toit[5] that the opposite coasts of the ocean have moved apart The presence of this current can also explain the central position of the ridge

The westward current bears the Americas towards and over the limb where the current is supposed to descend beneath the Cordillera and the Andes, while a current flowing eastwards can be assumed to converge towards the Alpine-Himalayan mountain belt from the north-west and the south-west The extension of this concept to the ridge through the Southern Ocean poses a difficulty From the Atlantic the ridge passes south of Africa and Australia to reach the Americas, but a current spreading south from this part of the ridge would flow towards Antarctica from nearly every direction and have no sink into which to descend The only compressional mountains in Antarctica lie along the antarctic peninsula (Grahamland) and these are scarcely adequate To escape the dilemma one must suppose that, instead of a current flowing south from the ridge, the ridge itself is migrating northwards and that the ring which it forms around most of Antarctica is expanding in radius If so, the current flowing northwards on the other side of the ridge is moving at twice the normal rate (taken as of the order of 1 cm /yr by both Dietz and Hess)

This would cause a relatively rapid northward movement of all the southern continents except South America, a fact which is borne out by palæomagnetic observations Blackett, Clegg and Stubbs[6] have recently shown that for the past 2 × 10^8 years Africa, India, and Australia have all been moving north at rates of 2–8 cm /yr

It will be observed that, since the mid-ocean ridge meets the west coast of South America and does not pass south of it, there is not the same reason for South America to have moved north Nevertheless, its fit with Africa suggests such motion It would be useful to have palæomagnetic data for South America

(*Note added in proof* E Irving has directed my attention to palæomagnetic work by K M Creer[16,17] on the Jurassic (Serra Geral) lavas of Uruguay and southern Brazil which suggests that the Brazilian Shield has not changed appreciably in latitude since the Jurassic—a result consistent with the view outlined here)

A similar outward motion may also be taking place in the mid-ocean ridges which in the South Atlantic, Southern and Indian Oceans nearly surround Africa If one is to believe that the African rift valleys are due to spreading, this expansion must be happening

A corollary of this expansion of the ring-shaped ridges around Antarctica and Africa is that, since they cannot expand indefinitely changes must occur occasionally in the location of the currents in the mantle

The ridge across the Pacific, called the East Pacific rise, extends to the Gulf of California[7] Seismicity and topography suggest that two branches reach Juan Fernandez and Galapagos Islands, but these have not been fully investigated If these branches are also upwellings, each ridge will induce a faster flow northwards, for there is no sign of any compressional features between them Following the previous argument there should be no movement of Cape Horn away from Antarctica , but north of Juan Fernandez there should be a motion twice that of the convection-rate, north of Galapagos four times that rate, and off California six times that rate This may provide an explanation of the lack of any shearing or isthmus across the Scotia Sea, the anti-clockwise rotation of the Pacific basin and the strong motion along the San Andreas fault

The current flowing east from the East Pacific rise meets that from the Atlantic under the Andes to produce their present uplift and activity, but Menard's proposal that in the United States and Canada the East Pacific rise now lies along the most active part of the Cordillera, implies that a former downward current has been replaced by an upward one which must have involved some drastic tectonic adjustments One possible consequence of removing the downward current would be to cause North America to move westward relative to South America This could have been a factor in producing the large shear faults in the Caribbean and those recently discovered in the floor of the Pacific off North America of which Menard[7] gives details Unfortunately their age is unknown

The current flowing north-west from the East Pacific rise presumably meets the current flowing south-east from the ridges in the North Atlantic Ocean and Arctic Sea The resulting downflow and compression can be held to have produced the east Asian arcs in much the manner postulated by Scheidegger[8], indeed, no other explanation has yet been offered why failure should take the form of circular arcs with their centres tending to lie on continental margins Thus some features of the contraction theory are preserved This movement of the Pacific basin north-west past the end of the Indonesian-Melanesian belt of mountains and island arcs fits the shearing observed between the Philippines and New Zealand[9]

Hess suggests that the East Pacific rise may have only been formed in mid-Cretaceous time when the location of a rising convection current changed to its present position from an earlier one lying at right angles in a west-north-westerly direction from the Society to the Caroline Islands Before this change, the orogenetic forces would have been quite different from to-day and the Cordillera would have been under strong compression and uplift The change may well have coincided also with the formation of several new island arcs in the Pacific The Kuril, Aleutian and Mariana, Yap and Palau Islands appear to be of about that age

Continental Mountain Systems

The concept that the circum-Pacific and Alpine-Himalayan mountain systems are due to compression over downward flowing limbs of huge convection cells is straightforward except for the complication already mentioned in California and Dietz's enigmatic statement that a rift is opening in the Mediterranean It appears rather to be closing This theory offers an explanation of two formerly puzzling features of older arcs The first is that it was never apparent why island arcs, so symmetrical in youth as for example the Kurils, should lose this with age, for example in the Andes It now appears likely that the Andes formed as arcs off the coast of South America and that these arcs have been overrun and swept up by the westward motion of the continent The contrast between the position of deep-focus earthquakes under the heart of the South American continent[10] and off the margin of east Asia is another indication of this To be thus caught up and overridden appears to the fate of arcs

Another feature, which was hard to explain by earlier theories and which appeared to be contrary to uniformitarianism, is that, whereas the active mountains form one continuous T-shaped pattern, older mountain systems only form short lengths, It is difficult to fit the Hercynian Appalachian mountains together into a single system and quite impossible to do it for Precambrian orogenies.

Relations to Older Orogenetic Theories

Besides admitting of some features of compression in mountains, the new theory admits of continental growth, both by sweeping up sediments on the ocean floor and by the emission of andesitic lavas. This growth along some continental margins implies that coasts separated by rifting need not necessarily fit if later brought together again.

Not only does this marginal growth make it difficult to find the coasts which formerly fitted together, but also old theories of continental drift included the notion that all continents had formerly been united into one or two. This idea, which would have involved untenable distortion of continents, seems unnecessary. The blocks of continents should rather be thought of as sometimes moving together in one place and sometimes splitting and moving apart at another place, always producing scattered patterns.

In one respect the break-up of continents does not seem to be quite random. There appears to be a tendency for them to split along former mountain systems. Thus on the Atlantic coasts of both Africa and South America there seem to be parts of mountain systems formed at the end of the Precambrian or in early Palæozoic time, suggesting that a single system split longitudinally. As pointed out by M. S. Krishnan[11], there is a similar correspondence between the late-Precambrian rocks of East Africa, Madagascar, Ceylon and southern India. The East African rift valleys follow rather closely the boundary between the Mozambique belt and older Precambrian provinces in the interior of Africa. If Menard is correct, the East Pacific rise is starting to split the Cordillera in California.

If convection currents are continually stirring the mantle, they would ensure a uniformity in its composition which would fit the views of Russell and Farquhar on the source of lead ores[12].

A point about possible convection currents which has been generally overlooked concerns the change in viscosity of the mantle with depth. Due to the thermal gradient this is likely to be large. If so, the cross-section of convection cells should be much greater near the surface than near the core of the Earth. Diagrams and discussions of convection in the Earth rarely consider this.

Movements of continents would cause the principal moments of inertia of the Earth to change and would induce polar wandering. This process would be particularly effective where two continents pile up against one another to great elevations as north of India. If such compression proceeds at the rate of a few cm./yr., it would produce hundreds of km. of shortening in ten million years. Since no mountains are compressed more than this, some factor must either change the pattern of convection cells within ten million years after continents come into contact or else a new process must arise by which convection currents begin to shear beneath continents. Three possible cases are worth considering. If some continents during certain periods have had a current flowing beneath them, whereas at other times they have been passively borne along with the current, it may be possible to find some geological phenomena, such, for example, as periods of dike formation, associated with one motion and not with the other. Another alternative is that the convection currents may be stopped or even reversed by the piling up of heat-producing continental material. To test this more heat-flow measurements are needed over mountains. It is tempting to relate the somewhat symmetrical arrangement of currents about the Earth's axis to dynamical control as is the case in the Earth's core. This symmetry was the basis of the tetrahedral hypothesis and has been translated into modern terms of ridges and mountains[13]. If this relation were true then polar wandering would affect the location of convection currents, but the evidence about the rate of polar motion suggests that it is too slow to effect changes in mountain building currents within periods of the order of ten million years. It is also doubtful if the forces are strong enough to make this linkage important. A reason for periodically changing the location of convection cells by large amounts is still needed.

The collision of continents might be expected to produce migrating waves of uplift which could catch klippe of sedimentary rocks on their advancing crests and carry them forward like surfboards on waves, stranding them when the uplift subsided. This offers a possible expanation, heretofore lacking, of some isolated and far-reaching overthrusts.

Persistence of Continental Freeboard

Dietz and Hess both recognize that continents and ocean basins are in isostatic equilibrium and that no large part of a continent can very long remain high because erosion and the rise of its roots will bring it down nearly to sea-level. They also recognize that the constant additions of juvenile water and lava from within the Earth make the problem of raising the level of the continents and of thickening them equally important, but more difficult. They suggest three mechanisms, of which Dietz states that continents "tend to buckle, which accounts for alpine folding, thrust faulting and similar compressional effects", that clastic detritus swept into the deep sea "is carried slowly towards, and then beneath the continents, where it is granitized and added anew to the sialic blocks" and that "new buoyancy is added to continents through the gravitative differentiation from the mantle".

The first two are true under mountains, but not under shields, where the crux of the problem lies. If for the sake of argument we adopt Hess's view that 4×10^9 years ago the continental blocks had half and the oceans a third of their present volumes, and that both have grown at a uniform rate, it can be shown that in Cambrian time, 6×10^8 years ago, the oceans would have been on the average 0.7 km. shallower and the continents 3.3 km. less thick than to-day. Dietz and Hess both maintain that to avoid being drowned beneath the sea, not only mountains but also the crust beneath plains must have been thickened by some such amounts.

The almost flat-lying Palæozoic rocks which cover so much of the interior plains of Canada and United States provide evidence that buckling of the shield has not been the cause of any post-Cambrian thickening of the plains.

To suppose that sediments were carried down along continental margins, metamorphosed and that they rose again is a very satisfactory explanation of the gneissic batholiths in marginal mountains, but what evidence is there that sediments are carried far under continents and that this process operates to uplift plains ? In the western Andes there are many batholiths to which the above explanation might apply, but there is nothing to suggest that batholiths are rising above the foci of the deep earthquakes in the Upper Amazon or Parana-Paraguay valleys These valleys are at low elevations and are not being uplifted Hess's argument about the spreading of mountain roots fails for the same reason

The third concept, that of differentiation of acid rocks in the mantle and their rise, is one which I have supported as an explanation of andesitic volcanism in the continental mountain systems , but what evidence is there that any such process has added about 3 km to the thickness of the interior plains of North America since the Cambrian? The only evidences of igneous activity there are a few nepheline basalt volcanoes of Cretaceous age, forming the Monteregian hills near Montreal, small carbonatite intrusions like the ten between Montreal and Lake Superior[14], very small pipes of ultra-basic rocks as in Kansas, some crypto-volcanic structures and a few other igneous intrusions, all small, isolated and rarely siliceous Most of these rocks are not acid differentiates and most of them can only have come from the mantle If these intrusions could find their way to the surface, and if 3 km of acid rocks had been added to the base of the crust during the same period, surely there would be more signs of the acid rocks All this evidence suggests that continents grow at their margins Although it is often stated that continental shields thicken, there is a lack of evidence that this has happened, at least since early Precambrian time.

The impasse is avoided if no new material is being added from the interior of the Earth, but this is contrary to several sound arguments Another possibility is that the Earth is slowly expanding A rate of a few mm /yr would suffice to maintain continents above sea-level This would not interfere with and indeed might assist the other orogenetic processes described As Dicke[15] has pointed out, this is a matter of fundamental importance in physics and cosmology and one which it is very hard to prove or disprove

CARBONYL CONTENT OF THE VITRAIN COMPONENT OF BITUMINOUS COALS*

By DR. K. LITTLEWOOD and M T. MONAGHAN
Department of Fuel Technology and Chemical Engineering, University of Sheffield

IT is generally recognized that oxygen occupies a position in the structure of coal comparable with that of carbon Consequently, much work has been carried out in order to determine the percentage of oxygen contained in the various functional groups in coals of a wide range of carbon content A summary of the methods used and the results obtained has been given by Blom *et al* [1]

Of the methods used previously for determining the carbonyl fraction, that which has found widest application involves the use of excess phenylhydrazine[1,2] In this method the finely divided coal is treated with phenylhydrazine at 100° C in an aqueous medium, followed by volumetric determination of the excess reagent Although fairly consistent results have been obtained the method suffers from several disadvantages which make the results subject to error For example, both coals and humic acids react with compounds containing the NH_2 group (for example, aqueous ammonia at 100° C [3], ethylenediamine[4], etc), forming compounds which are not hydrolysable

Other errors result from the fact that many quinones are reduced by phenylhydrazine so that they do not yield any hydrazone In addition, the presence of aromatic rings inhibits the complete formation of the hydrazone[5]

In view of these difficulties, a method based on the reaction of carbonyl compounds with hydroxylamine was evolved[1] Coal of known nitrogen content is treated with hydroxylamine in pyridine at 90° C for 20 hr The nitrogen content of the coal remaining is then determined before and after hydrolysis with sulphuric acid The hydrolysed oxime is determined as ammonia In every instance it was noted that more hydroxylamine was taken up than could be split off by hydrolysis The anomalous results were attributed to reactions of hydroxylamine with non-carbonyl substances and to the fact that the oximes of some carbonyl compounds are not readily hydrolysable

As neither of the above techniques was completely reliable, it was decided to investigate the possible application of the specific reagent, trimethylacetoaminohydrazide hydrochloride (Girard's reagent-*T*)[6], to the determination of the carbonyl content of vitrains. Girard's reagent is a white, crystalline

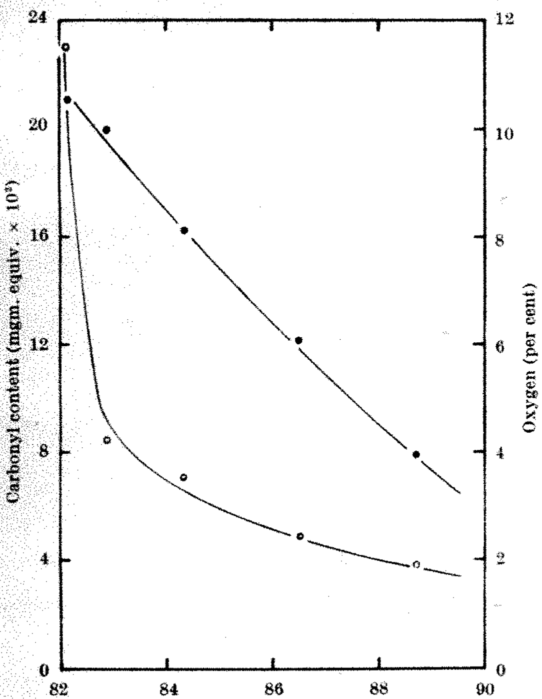

Fig. 1. Relationship between carbonyl content, oxygen content and coal rank. ○, carbonyl; ●, oxygen

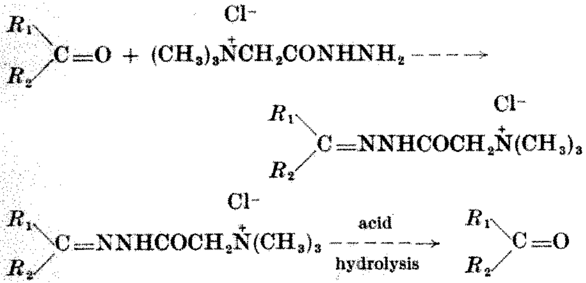
solid which is very soluble in water and organic solvents containing a hydroxyl group. The reagent has a great affinity for ketonic carbonyl compounds and reacts with them quickly and quantitatively even when they are present in very small amounts[7-10].

The function of the reagent is to produce a water-soluble derivative by a condensation reaction with the carbonyl compound which can then be separated from the remaining inactive material. The carbonyl fraction thus removed can be regenerated by acid hydrolysis and afterwards estimated by conventional methods. The reactions involved are illustrated in the following reactions:



$$R_1R_2C{=}O + (CH_3)_3\overset{+}{N}CH_2CONHNH_2\,Cl^- \dashrightarrow R_1R_2C{=}NNHCOCH_2\overset{+}{N}(CH_3)_3\,Cl^-$$

$$R_1R_2C{=}NNHCOCH_2\overset{+}{N}(CH_3)_3\,Cl^- \xrightarrow[\text{hydrolysis}]{\text{acid}} R_1R_2C{=}O$$

Thus the obvious advantages of Girard's reagent are: (1) it reacts exclusively with carbonyl compounds; (2) it extracts the carbonyl compounds as water-soluble derivatives which are easy to manipulate.

The analytical data of the vitrains used are summarized in Table 1 and the experimental procedure is as follows: About 2·0 gm. dry vitrain (– 200 mesh B.S. sieve) were weighed accurately and then transferred to a 500-ml. flask to which were added 100 ml. absolute ethyl alcohol, 10 ml. glacial acetic acid and 5 gm. Girard's reagent-*T*. After boiling under reflux for 24 hr., the solution was cooled by the addition of 300 ml. distilled water containing sufficient caustic soda to neutralize 90 per cent of the acetic acid present. After allowing the insoluble material to settle, the solution was filtered through a weighed sintered glass crucible (porosity *G*4); the residue was washed and dried at 110° C. until of constant weight.

Table 1. Analytical Data of the Vitrains

					Analysis (Parr basis)				
No. of coal	N.C.B. code No.	Water per cent	Ash per cent	S (d.a.f.) per cent	C per cent	H per cent	N per cent	O (diff.) per cent	V.M. (d.a.f.) per cent
1	301	6·40	0·97	0·68	88·67	5·38	2·04	3·91	23·53
2	501	1·66	0·06	1·14	86·49	5·44	1·98	6·09	34·50
3	602	6·83	1·22	1·26	84·34	5·05	1·92	8·11	37·59
4	701	5·09	5·43	0·97	82·88	5·36	1·78	9·98	33·41
5	802	6·99	1·78	1·18	82·16	5·37	1·90	10·57	40·43

In order to hydrolyse the water-soluble derivative, 10 ml. concentrated sulphuric acid were added to the combined filtrate and washings and the resulting solution was warmed on a water-bath at 70° C. to complete the hydrolysis. The solution, after cooling, was added from a burette into an excess of 2,4-dinitrophenylhydrazine. The mixture was allowed to stand for 1 hr. to ensure complete precipitation of the hydrazone. The resulting hydrazone was filtered through a weighed sintered glass crucible (porosity *G*4), washed and dried at 110° C. until of constant weight.

The results obtained by determining the carbonyl content by reaction with Girard's reagent-*T* followed by hydrolysis and estimation with 2,4-dinitrophenylhydrazine are given in Table 2. The results are quoted in terms of mgm. 2,4-dinitrophenylhydrazone (column 3) and have been converted to mgm. equivalents of C=O in column 4.

Table 2. Carbonyl Contents of the Vitrains

Coal	Carbon (per cent)	mgm. dinitrophenyl-hydrazone/gm.	mgm. equiv.* C=O/gm.
301	88·67	6·0	0·03
501	86·49	10·0	0·05
602	84·34	15·0	0·07
701	82·88	17·5	0·08
802	82·16	48·0	0·23

* Maximum values.

The vitrains which were investigated ranged from 82 per cent carbon (10·6 per cent oxygen) to 89 per cent carbon (4 per cent oxygen). The expected decrease in carbonyl content with increasing coal rank, that is, decreasing oxygen content, is clearly demonstrated in Fig. 1. The sensitivity of the reagent in detecting the differences in carbonyl contents of coals lying in such a narrow range of carbon content is of particular interest and is indicative of the specificity of the reagent. Other investigators suggest that this trend is correct although this has not been demonstrated previously.

The use of Girard's reagent in conjunction with 2,4-dinitrophenylhydrazine has been extended to give an indication of the weight average molecular weights of the ketones involved. Full details of this are to be published elsewhere.

We wish to thank Prof. M. W. Thring for his permission to submit this article.

FORMATION OF CRACKS IN ICE PLATES BY THERMAL SHOCK

By L. W. GOLD

Snow and Ice Section, Division of Building Research, National Research Council, Canada

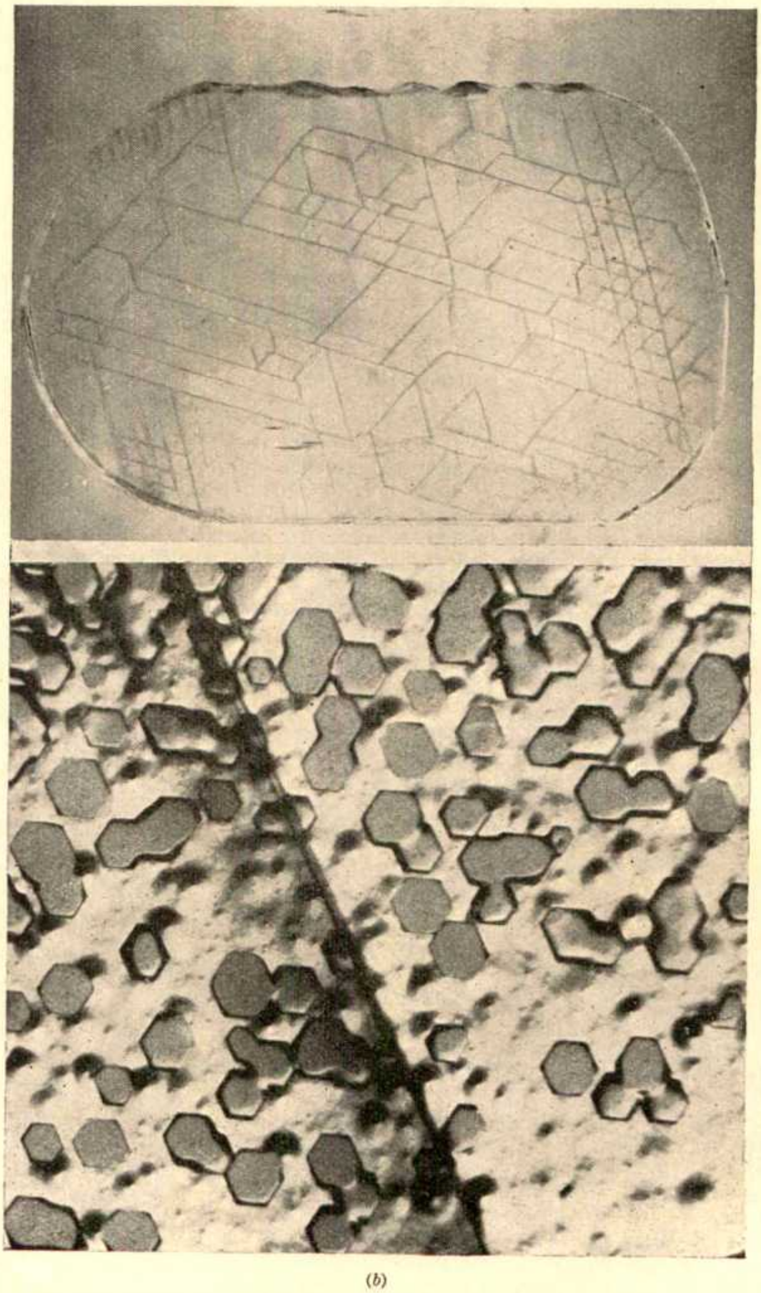
IN work on crack formation in multi-grained ice during creep under constant compressive load[1], the question arose as to whether the direction of the formation of a crack depended on the crystallographic orientation of the grains in which it formed. Experiments were undertaken to investigate this possible dependence. In one set of experiments a thermal shock was applied to the flat surface of an ice plate in such a way that the resulting thermal stress exceeded the cohesive strength of the ice almost instantaneously.

The first observations were made on irregularly shaped ice plates prepared from single crystals grown by a technique described by Landauer[2]. The plates were about 10 cm. in length and width and about 2 cm. thick. They were prepared with a milling machine using a helical cutter about 15 cm. long. Some plates were machined so that the axis of hexagonal symmetry, or '*c*' axis, of the ice crystal was normal to the surface and some so that the '*c*' axis was parallel to the surface. After machining, the plates were stored in kerosene at − 10° C. for at least 24 hr. Earlier work on the elastic and strength properties of ice had shown that immersion of the ice in kerosene for periods of up to 30 days or more did not appear to affect these properties.

Thermal shock was applied by bringing the smooth surface of an ice plate, at − 10° C., in contact with the smooth flat surface of a brass plate cooled to below −45° C. with dry ice. To ensure good thermal contact, the brass plate was immersed in kerosene just deeply enough to ensure that a very thin film of the liquid lay over the surface to which the ice plate was applied.

When the ice plates were brought into contact with the brass plate, cracks formed very quickly, certainly within 1 sec. For this stress condition, outside the region influenced by the edge the principal stresses are equal and the shear stresses are zero on any plane parallel to the ice surface. Therefore very little, if any, creep could have occurred in such planes or perpendicular to them in the short time that it took for the cracks to form.

(*a*)



(*b*)

Fig. 1. (*a*) Crack pattern for axis of hexagonal symmetry perpendicular to surface of plate; (*b*) orientation of cracks with respect to hexagonal etch pits. Crack is line running from upper left to lower right. (× 50)

The crack pattern which developed was found to depend almost entirely on the crystallographic orientation of the ice with respect to the shocked

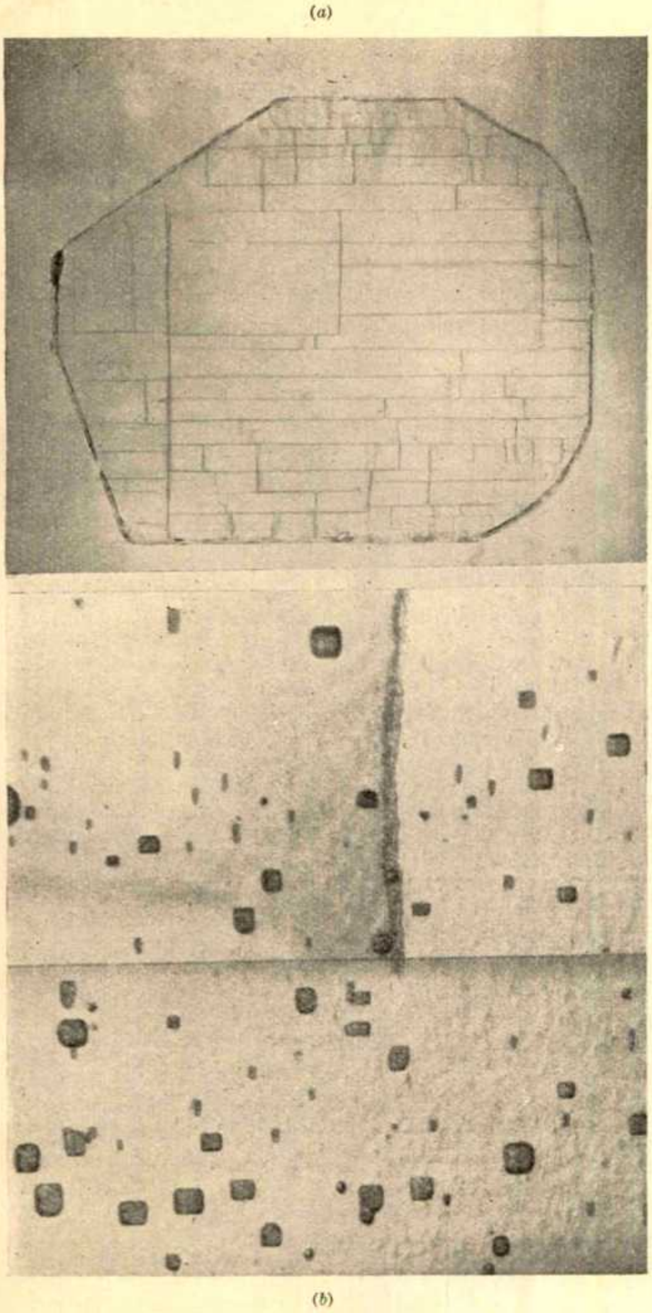


Fig. 2. (a) Crack pattern for axis of hexagonal symmetry parallel to surface of plate; (b) orientation of cracks with respect to rectangular etch pits. Basal plane of ice perpendicular to surface and parallel to the bottom edge of the photograph. (× 40)

surface. An example is shown in Fig. 1*a* for the case where the axis of hexagonal symmetry is perpendicular to the plate surface. The crack pattern is a system of equilateral triangles. As shown in Fig. 1*b*, the trace of the cracks on the surface was found to be parallel to the sides of hexagonal etch pits obtained by a technique described by Higuchi[3]. This shows, accepting Higuchi's conclusions on the orientation of the pits with respect to the crystallographic orientation, that with the symmetry axis perpendicular to the surface, there is a preference for the trace of the cracks at the surface to be parallel to the crystallographic '*a*' directions.

The rectangular crack pattern which develops when the symmetry axis lies in the plane of the plate surface is shown in Fig. 2*a*. Fig. 2*b* shows that the edges of the cracked segments are parallel to the sides of the rectangular etch pits that form on an ice surface with this orientation. The long dimension of the cracked segment was usually perpendicular to the crystallographic '*c*' direction, that is, this edge was normally in the basal plane.

The edges of each plate were cut in an irregular shape to see if this would have any influence on the crack pattern. It was observed, as can be seen in Figs. 1*a* and 2*a*, that only very close to the edge did the boundary conditions have an influence.

Figs. 1*b* and 2*b* show that there is a preference for the trace of the crack at the plate surface to be in the planes containing the '*a*' and '*c*' crystallographic directions. Etch pits formed on surfaces machined perpendicular to the plane of the crack and to the plate surface showed that near the plate surface the cracks tend to be parallel to the planes containing the '*a*' and '*c*' directions, but often curve out of these planes farther into the interior of the ice. This is considered to be due to the tendency for the cracked segments to curl under the tensile stresses parallel to the plate surface. This curving of the crack may be aided by the fact that the maximum tensile stress at the root of a crack is not perpendicular to the plane of the crack but at an angle to this plane[4]. The shaded area parallel to some of the cracks is due to the curving of the crack below the surface. If the thermal shock is severe and long enough, some of the crack segments will separate from the plate in a way similar to the spalling of concrete.

The experiments have now been extended to multigrained ice of average grain size as small as 2 mm. and with the crystallographic orientation of the grains at various angles to the surface. The preference for the trace of the cracks at the surface to be parallel to the planes containing the '*a*' and '*c*' directions is maintained for all grain sizes observed so far, a crack often changing direction abruptly as it passes from one grain to the next.

Some refinements have been made in the experimental technique. By using ice instead of brass for the cold plate and making both plates quite thick the change in temperature at the surface can be calculated and readily controlled and expressions obtained for the dependence on time of the temperature in the ice plates and the associated thermal stress. Using these expressions, a cohesive strength of 40–50 kgm./cm.² has been obtained for ice for the particular stress condition applied. The experiments and their analysis are continuing and will be reported in full when completed.

PHOTOCHEMICAL PROPERTIES OF WATER-SOLUBLE CHLOROPHYLL

By Prof. GERALD OSTER and SUSE B. BROYDE

Department of Chemistry, Polytechnic Institute of Brooklyn

THE water-soluble chlorophyll, potassium chlorophyllin, obtained by saponification of chlorophyll with alkali, has been known for more than fifty years[1], yet the photochemistry of this interesting pigment has not been investigated. Since chlorophyllin is soluble in water, its photochemical properties can be compared directly with other water-soluble dyes the photosensitizing action of which for oxidations and reductions have been studied in detail[2]. Water is a more natural *milieu* than are the organic liquids which are required to dissolve chlorophyll. Water-soluble dyes will bind to high-polymer substrates[3] with dramatic changes in photo-chemical properties[4,5] and chlorophyllin would be expected to behave similarly. Furthermore, since chlorophyll is in the bound state in the living plant, the photochemical properties of bound chlorophyllin may have some immediate relevance to the photochemical steps in photosynthesis. Another reason for studying the photochemistry of chlorophyllin is that it has some structural differences from chlorophyll and hence theories as to the reactive groups can be tested.

Chlorophyll *a* was obtained chromatographically from spinach extract[6] and the dried pigment was dissolved in benzene and diluted 1 : 14 with pentane. This solution was shaken with 7 per cent methanolic potassium hydroxide to saponify the chlorophyll. The methanolic solution of potassium chlorophyllin *a* was placed under vacuum in order to remove the solvent and the material was stored dry. The photochemical investigations were carried out with chlorophyllin in 0·6 *M* phosphate buffer at *p*H 7·0.

Treatment with methanolic potassium hydroxide causes the material to be soluble in water. The phytol and methyl esters are saponified. Furthermore, the cyclopentanone ring (ring V in the chlorophyll structure) is broken so that three carboxylate groups result. The magnesium is retained at neutral and at basic *p*H values.

The infra-red spectra of chlorophyllin (potassium bromide pellets and measured in a Perkin-Elmer model 21 spectrophotometer) do not have the 1611 cm.$^{-1}$ band associated with porphyrins containing a cyclopentanone ring[7] and ascribed to the C=C bond of this ring in its enolic form[8]. The two principal absorption bands in the visible spectrum of chlorophyllin (Fig. 1), measured in a Cary spectrophotometer, are at shorter wave-lengths than chlorophyll *a*, and the satellite on the short wave-length side of the Soret band is absent. Similar changes in the visible spectrum are observed in one of the fractions of allomerized chlorophyll where the cyclopentanone ring is believed to have been transformed[9]. Other losses in detail in the absorption spectrum further indicate that the molecule resulting from cleavage of ring V is less rigid. The strong red fluorescence of chlorophyllin has its maximum at 646 mμ while chlorophyll *a* has its maximum fluorescence at about 20 mμ farther into the red part of the spectrum.

Chlorophyllin in the bound state is a good photosensitizer ; free in solution, it is much less effective. Chlorophyllin, like other anionic dyes[3], binds to polyvinyl pyrrolidone (PVP) with a spectral shift of the long-wave peak to 660 mμ. The bound chlorophyllin sensitizes the photoautoxidation of *para*- and *ortho*-aromatic amines just as do triphenyl methane dyes if they are in the bound state[10]. The well-known chlorophyll-sensitized photoreduction of azo dyes in non-aqueous media[11] can be duplicated in water by bound chlorophyllin[12]. Although ascorbic acid and phenylhydrazine are effective reducing agents for this reaction, chelating agents which can serve as electron donors in photoreductions of synthetic dyes[13] are inactive for chlorophyllin.

Chlorophyllin undergoes the Krasnovsky reaction[14], that is, reversible photoreduction in the presence of ascorbic acid. With chlorophyll *a* this reaction is carried out in pyridine with some water present[15] to give an intermediate with a maximum at 523 mμ ; with chlorophyllin *a* the major solvent constituent is water (with 10 per cent pyridine) and the maximum of the pink solution is at 550 mμ. Evidently the cyclopentanone ring is not required for this reaction[16]. Bound chlorophyllin, on the other hand, is photoreduced rapidly and irreversibly to a colourless species under the conditions of the Krasnovsky reaction.

Chlorophyllin, on standing in aqueous solution, is slowly transformed into a colloidal species, and this

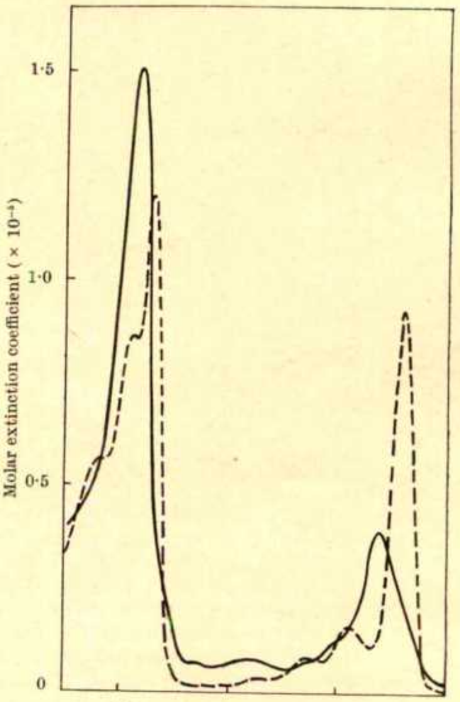

Fig. 1. Spectra of chlorophyllin *a* (continuous line) and chlorophyll *a* (dotted line)

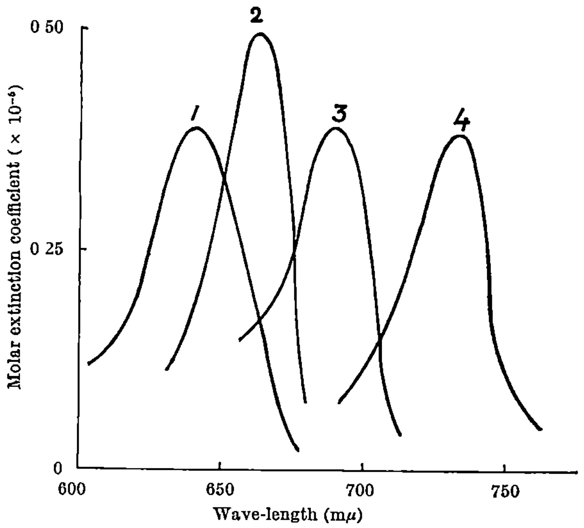

Fig 2 Changes in long wave-length peak of chlorophyllin 1, freshly prepared in water, 2, addition of PVP to No 1, 3, after illumination of No 2, 4, long standing of No 1 (reverts to No 3 on addition of PVP and to No 1 on addition of alkali)

transformation is accelerated by light or heat The system is non-fluorescent and absorbs at 735 mμ (Fig 2) as is also the case for suspensions of chlorophyll microcrystals[17] This suggests that the state of aggregation, rather than the difference in details of structure, determines the position of this peak Addition of PVP or of water-miscible organic solvents disperses the colloid to produce a strongly fluorescent solution with an absorption maximum at 688 mμ. This latter species can be obtained directly by binding chlorophyllin to PVP and exposing to light (Fig 2) Both the colloidal suspension and the solution absorbing at 688 mμ revert to the original chlorophyllin solution when the system is rendered alkaline The species which forms colloidal suspensions in water has an infra-red band at 1,730 cm $^{-1}$ as compared with the analogous band of chlorophyllin itself at 1,680 cm $^{-1}$ These facts suggest that the water-insoluble species results from a dimerization of the carboxylate groups in chlorophyllin The existence of a dimer of chlorophyll *a* absorbing at about 682 mμ has been deduced from difference spectra of chlorophyll solutions[18]

The photochemical reactions of chlorophyllin described here supplement the extensive work already carried out on chlorophyll[19], but new features are apparent Our results show that (*a*) photochemical activity of a chlorophyll derivative does occur in predominantly aqueous media, (*b*) the spectra of aggregates of chlorophyllin are the same as those of chlorophyll although there are differences in molecular structure, (*c*) certain spectral features and photochemical reactions occur for bound pigment but not for the molecules free in solution, and (*d*) the cyclopentanone ring is not required for photochemical activity We are now carrying out quantitative work to determine the mechanism of the photochemical reactions of chlorophyllin

A QUANTITATIVE THEORY OF THE CHARACTER OF CHEMICAL BONDING IN BINARY COMPOUNDS

By Prof EDWARD GÖRLICH

Department of Silicate Chemistry, School of Mining and Metallurgy, College of Ceramics, Cracow

IN view of the great difficulties encountered in the case of a strict quantum-mechanical treatment of many chemical problems, especially in the field of inorganic chemistry, many attempts were aimed at a more qualitative approach to the problems involved by other, much simpler methods Of such, the most widely known are Pauling's theory of electronegativity, the theory of oxygen attraction, first put forward by van Arkel and de Boer, Fajans' theory of ionic polarization and his quanticule theory and Weyl's theory of screening It appears to me that, accepting as a first approximation a purely electrostatic character of chemical bonding, it is possible to establish a quantitative theory of binary chemical compounds

The proposed theory is based on the following assumptions:

(1) Every kind of chemical compound (salts, metals, molecular compounds) is made of cations, or positive cores equivalent to cations, and a number of valency (or bonding) electrons, which form various configurations of electron clouds

(2) Homonuclear compounds (pure elements) are built of one kind of cation or positive core only Differences in their chemical characteristics are due to the different degrees of polarization of electron

clouds by the specific cations or cores. If there is no perceptible effect of polarization a purely metallic bonding results. A growing effect of polarization results in a more and more atomic (covalent) character of binding.

(3) The ionic character of bonding in binary heteronuclear compounds is due to the asymmetry of the attraction of the valency electrons by the two different kinds of cations or positive cores present, one of which is pulling the electrons more strongly than the other. In a purely ionic binary compound the strength of the field of one cation is completely negligible in comparison with the other which, in consequence, forms a positive core of an anion.

The proposed system may be presented in the form of a diagram with the following co-ordinates:

(*a*) The values of the ionic potential φ, which, according to Cartledge (1926), is a measure of the polarizing ability of cations, are taken as abscissæ. The abscissa is the axis of homonuclear compounds, along which the ionic potential φ increases from zero (the origin of the co-ordinate system) corresponding to a purely metallic bond up to the value of 87.5 for F^{7+}, corresponding to an extremely atomic (covalent) character of bonding in F_2.

(*b*) As the ordinate, the relative values of the differences between the ionic potentials of cations or positive cores, expressed in percentage of the ionic potential $\varphi_1 (\varphi_1 > \varphi_2)$, may be accepted $\frac{\Delta\varphi}{\varphi_1} \times 100$.

The value of this parameter is zero for a purely metallic bond (taken as the origin of the system) and for purely ionic bonds it reaches the value of 100.

The diagram for the proposed system of bond character of binary compounds may be constructed in the form of a right-angled triangle with apexes representing purely metallic, ionic and most nearly atomic (covalent) character of bonding (Fig. 1).

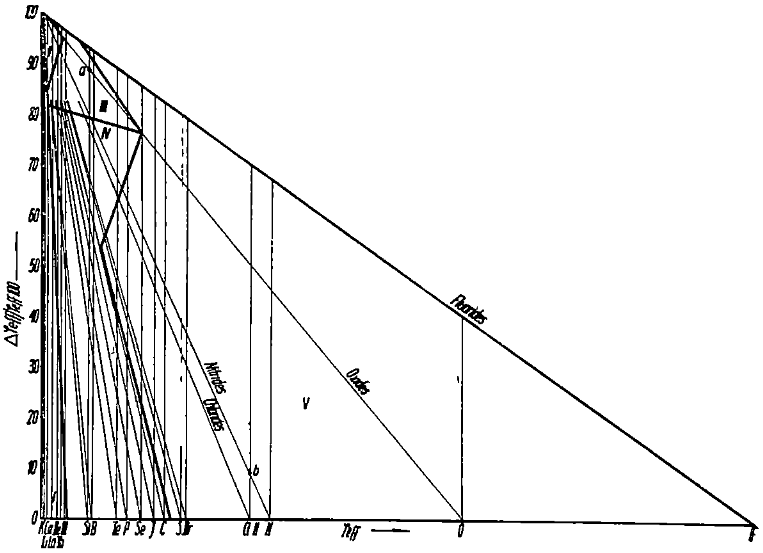

Fig. 1

The values of ionic radii given by Ahrens[1] were accepted in computations of ionic potentials throughout this article.

It is, however, more correct to use instead of 'formal' ionic potentials, as formerly proposed by Cartledge, the effective (actual) values of ionic potentials. The effective ionic potential φ_{eff} is related to the electronegativity as proposed by Pauling (log φ_{eff} is a linear function of Pauling's electronegativity). It constitutes also a measure of the acidity (or basicity) of the cation[2].

$$\frac{\varphi_{eff}}{\varphi} = x$$

For noble gas-type cations with the same charge, the coefficient x has the same constant value. As a measure of the actual field strength of cations the values of the so-called field function $F = I^p/r$ are proposed here[1], where I^p is the pth ionization potential with charge p of the chemical element forming a given cation) and r is the ionic radius. As may be demonstrated, the relation $F = I^p/r = x \times \varphi - a$ is strictly valid for all inert gas-type cations of the same charge. Putting $I^p/r + a = \varphi_{eff}$ we can find the value of the coefficient x (Table 1). Only inert gas-type cations are considered here, the more complex problems of the elements of the sub-groups of the periodic system will be treated in a separate paper.

The character of bonding of a binary compound is represented by a point on the diagram (Fig. 1), lying at the intersection of two lines, one of them parallel to the axis of the ordinate ($M - I$) and cutting the axis of the abscissa at φ_{eff} of the weaker cation or core (that is, one which has the smaller value of φ_{eff}) and the second connecting the value φ_{eff} of the stronger cation or core (that is, one which has the greater value of φ_{eff}) with the ionic apex of the triangle. For example, point *a* represents the character of the bond Si—O, and point *b* that of N—Cl.

As Fig. 1 shows, all points representing fluorides lie on the same line connecting the φ_{eff} value for

Table 1. VALUES OF THE COEFFICIENTS x* OF CATIONS OR POSITIVE CORES OF INERT GAS-TYPE WITH THE CHARGE z

z	x
1	0.65
2	1.08

4	1.90
5	2.30
6	2.70
7	3.10
8	3.50

* The coefficient $x = \varphi_{eff}/\varphi$ may be regarded as a relative electrostatic electronegativity value of the cations or positive cores.

Table 2

Field* (Figs. 1 and 2)	Type of binary compound	Character of electrostatic bonding	State of aggregation †
I	Metals and intermetallic compounds	Metallic	Solid
II	Salts (alkaline oxides included)	Ionic	Solid
III	Polymers	Ionoidic (sub-ionic)	Solid (glass-forming)
IV	Sub-metals (semi-conductors and semimetals)	Sub-metallic (metalloidic)	Solid
V	Molecular compounds	Atomic (covalent)	Solid, liquid or gas
VI	Inert gases	None	Gas (free atoms)

* Many of the properties of the binary compounds, resulting from the different nature of their chemical bonds, are, of course, changing more gradually than is suggested by the sharp boundary lines shown on Figs. 1 and 2.

† At room temperature and pressure.

F^{7+} with the apex *I*, and also points for all other compounds with common anion, namely, oxides, sulphides, chlorides, nitrides, etc , lie on their respective lines

Various physical and chemical properties of binary compounds (as, for example, their structures) are reasonably ordered by the proposed system It enables a classification of binary chemical compounds (Table 2)

Some irregularities noticeable among the halides are due to the fact that the proposed diagram (Fig 1) is a projection of a space diagram with *n* as the third axis of co-ordinates (*n* being the period of the Mendeleyevian system to which the given element belongs) The diagram log *n* – log φ_{eff} ordering the homonuclear compounds (pure elements) will be presented in a later communication

It is to be noted that for the elements of the main groups of the periodic system log- φ_{eff} is a linear function of log *z*, *z* being the group of the periodic system It is also to be mentioned that the expression $\Delta\varphi_{\mathrm{eff}}/\varphi_{\mathrm{eff}1}$, where $\varphi_{\mathrm{eff}1} > \varphi_{\mathrm{eff}2}$, may be considered as a measure of the chemical affinity of the elements forming a heteronuclear compound It was used by me to systematize the binary systems of equilibria for compounds with common anions[3]

The projection points on the diagram given by Fig 1 are very unevenly distributed To obtain a more uniform dispersion of points we must resort to a logarithmic scale This may be done by accepting the value φ_{eff} for Fr^+ as unity ($\varphi'_{\mathrm{eff}}Fr = 1{,}000$) This choice is justified by the fact that francium, as a homonuclear compound, must have the most nearly pure metallic character of bonding among all known elements As the others (atomic or covalent) we take F^{7+}, because fluorine in the F_2 molecule forms the most nearly atomic bonds known. Putting log φ'_{eff} value for Fr (that is, zero) at the origin of the system of co-ordinates (point *M*) and accepting the log φ'_{eff} value for F (2 876) as 100 (point *A*), we obtain a relative logarithmic scale on which the atomic character of bonding in homonuclear binary compounds may be expressed in percentages of that found in the F_2 molecules The diagram *I* – *M* – *A* may now be presented in the convenient form of an equilateral triangle (Fig 2) The ionic character of bonding is here also expressed in percentages $\Delta \log \varphi'_{\mathrm{eff}}/\log \varphi'_{\mathrm{eff}1} \times 100$ The ionic character of bonds in Fr—F has on the absolute scale (Fig 1) the value 99 87 per cent in comparison with 100 per cent on the relative logarithmic scale (Fig 2) The bond Si—O in SiO_2 is 35 8 per cent ionic on this scale (point *a*, Fig 2) The vertical line on this diagram is only an auxiliary scale

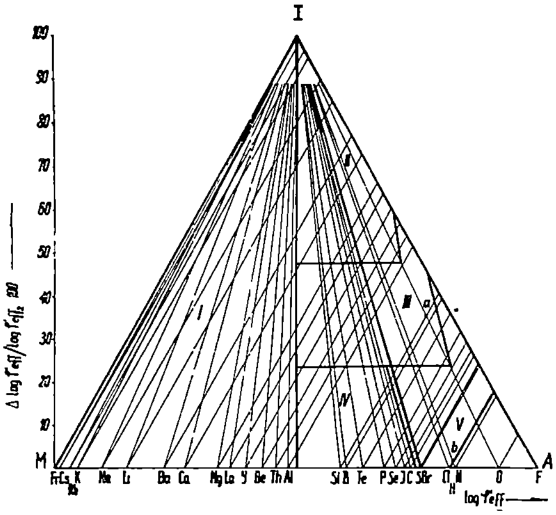

Fig 2

All points for fluorides, oxides and so on lie on the respective lines connecting the values for F, O and so on, lying on the *M–A* axis with the *I*—apex of the triangle—as on the diagram Fig 1 The fields bear the same denominations as on the previous diagram The proposed systems are valid for room temperature and atmospheric pressure. Possible defects in solids and the dispersion energy share in bonding are not taken into account here, nor are the magnetic forces

Sincere thanks are due to Prof A Bielański for valuable discussions

CHITINASE: AN ADDITION TO THE LIST OF HYDROLASES IN THE DIGESTIVE TRACT OF VERTEBRATES

By Dr. CHARLES JEUNIAUX

Department of Biochemistry, University of Liège

IT was thought for a long time that, in animals, chitinases were present in snails only The distribution of these enzymes among invertebrates has appeared to be much more extensive They have been found by Tracey in protozoa[1], in nematodes[2], and in earthworms[3], and by me in arthropods[4–6], cœlenterates[7], polychæte worms[7], etc The presence of chitinolytic enzymes among vertebrates has, however, never been suspected The enzymic lysis of chitin is known to be actually performed by two different enzymes, acting consecutively[8–9] a chitinase (mucopolysaccharidase) and a chitobiase (β-acetylglucosaminidase) This 'chitinolytic system' and these two enzymes have been searched for in the digestive juices and in aqueous extracts of digestive glands and digestive epithelia of some fishes, lizards, birds and mammals

In order to detect the chitinolytic system (chitinase + chitobiase), the enzymic extracts were incubated with a chitin suspension (from *Sepia* pen) at 37° C and *p*H 5 2 for 3 hr , the acetylglucosamine liberated was measured by a method described by Reissig *et al* [10] Controls without enzyme or without substrate were run simultaneously

In order to detect chitinase in enzymic extracts containing little or no chitobiase, the activity of these extracts on chitin has also been investigated after addition of an excess of chitobiase in the enzy-

Table 1 CHITINOLYTIC ENZYMES IN DIGESTIVE JUICES OF SOME VERTEBRATES

* Liberation of acetylglucosamine from chitin, by the enzymic extract

† Liberation of acetylglucosamine from chitin, by the enzymic extract after addition of an excess of chitobiase

‡ Liberation of acetylglucosamine from 'depolymerized chitin', a preparation containing chitobiose and other small polymers of acetylglucosamine

§ Non-significant results

mic test A commercial preparation of β-glucosidase (Nutritional Biochemicals Corporation) provided a convenient source of chitobiase, free from chitinase In these cases, the presence of chitinase was also confirmed by the nephelometric method[11], which does not depend on the presence or absence of chitobiase[9] In order to measure the chitobiase, the liberation of acetylglucosamine has been followed, using a preparation of 'depolymerized chitin' as substrate[12] (a preparation which contains chitobiose and other small polymers of acetylglucosamine)

The results are summarized in Tables 1 and 2. Chitinolytic enzymes have been found in the digestive tract of six species of vertebrates, among the eight species so far investigated, the digestive juices and tissues of turtle and rabbit being entirely devoid of chitinases In all these eight species, muscles, kidney and liver extracts were found to be free from chitinases, the presence of chitobiase only being evident in the livers of *Lacerta* and *Testudo*

The following tentative conclusions may be drawn from these results ·

(1) The chitinolytic enzymes have been found not only in the digestive contents, but also in glands and in carefully washed gastric or intestinal mucosa. Such localization does not support the hypothesis of a bacterial origin

(2) All the species where chitinase has been found are insectivorous, or eat chitin-covered preys, at least occasionally In contrast, the turtle and the rabbit, which do not possess any trace of chitinase secretion, are typical phytophagous animals This observation, if confirmed for other species, would represent the only clear-cut case, with that of lactase, of a correlation between diet and digestive enzymes among vertebrates

(3) The site of chitinase secretion seems to show an evolution towards a higher specialization of tissues: in the goldfish, the secretion of chitinase is a property of the whole epithelium and of pancreatic islets This faculty is restricted to the gastric mucosa and the pancreas in *Lacerta* in bats, the gastric mucosa alone has this property

In contrast, the secretion of chitobiase, although often very weak, occurs in the majority of tissues, even in the turtle and in the rabbit

(4) The cases of the pancreas of *Lacerta* and of the gastric mucosa of *Turdus* and of *Rhinolophus* are the first known examples of tissues being able to synthesize large amounts of chitinase, but secreting only very small amounts of chitobiase

A PRECIPITATING ANTIBODY TO INSULIN

By VALERIE E. JONES and PROF A. C CUNLIFFE

Department of Bacteriology, King's College Hospital Medical School, London, S E 5

ANTIBODIES to insulin preparations have been detected by many of the conventional immunological methods in the sera of insulin-treated diabetic and mental patients, and of animals immunized with insulin, but convincing demonstrations of antibodies to insulin itself are few[1] Furthermore, Lapresle and Grabar[2] have directed attention to the presence of precipitating antibodies in the sera of some diabetics, to antigens other than insulin These antigens were found in the mother liquor which remains after the initial crystallization of insulin. Precipitating antibodies to insulin were found by Moloney and Aprile[3], in a horse hyperimmunized with crystalline insulin, and both insulin and the antibody were recovered from the specific precipitate They were, however, unable to find precipitating antibodies in several other species, including guinea pigs, which were immunized in the
